THE ENCYCLOPÆDIA BRITANNICA FOURTEENTH EDITION

VOLUME 3 BALTIMORE TO BRAILA

BALTIMORE, GEORGE CALVERT, 1ST BARON (c. 1580–1632), English statesman, whose name is associated with the foundation of Maryland, son of Leonard Calvert, and Alice, daughter of John Crosland of Crosland; was born at Kipling in Yorkshire and educated at Trinity College, Oxford. After travelling on the continent, he entered the public service as secretary to Robert Cecil, afterwards earl of Salisbury. For his various services he received knighthood in 1617, a secretaryship of state in 1619 and a pension of £2,000 a year in 1620. He represented successively Bossiney (1609), Yorkshire (1621) and Oxford university (1624) in the House of Commons, where it fell to him in his official capacity to communicate the king's policy and to obtain supplies. He was distrusted by the parliament, and was in favour of the unpopular alliance with Spain and the Spanish marriage. He then declared himself a Roman Catholic, and on Feb. 12, 1625, threw up his office, when he was created Baron Baltimore of Baltimore and received a grant of large estates in Ireland. He had established a small settlement in Newfoundland in 1621, for which under the name of Avalon he procured a charter in 1623, and which he himself visited in 1627. In consequence of disputes and the unsuitable nature of the climate he sailed thence for Virginia, but was forbidden to settle there unless he took the oaths of allegiance and supremacy. He returned home, and died on April 15, 1632, before a new concession was secured, the charter of Maryland passing the great seal on June 20, 1632, in favour of his son Cecilus, second Lord Baltimore, who founded the colony. Baltimore wrote *Carmen funebre in D. Hen. Untonum* (1596); *The Answer to Tom Tell-Troth . . .* (1642) is also attributed to him, and Wood mentions Baltimore as having composed "something concerning Maryland." His letters are to be found in various publications, including Strafford's *Letters*, Clarendon *State Papers* and the *Calendars of State Papers*.

BIBLIOGRAPHY.—*George and Cecilus Calvert* by William Hand Browne (1890); Wood's *Athenae Oxonienses* (Bliss) ii. 522; Doyle's *The English in America; Discourse on the Life and Character of Sir G. Calvert* by J. P. Kennedy (1845), with the *Review* and the *Reply* to the same; *London Magazine*, June, 1768; "Sir G. Calvert," by L. W. Wilhelm (*Maryland Hist. Soc.*, April 14, 1884); *The Nation*, vol. 70, p. 95; *American Historical Review*, vol. 5, p. 577.

BALTIMORE, the chief town of Maryland, U.S.A., lies at the head of tidewater upon the Patapsco river, one of the many

deep-water estuaries of the Chesapeake bay. The river, like most Maryland rivers, divides and re-divides, there being no fewer than four broad stretches of water within the city limits. Curtis bay and creek, Middle branch and Spring gardens, Northwest branch and Colgate creek all cut more or less deeply into the city and carry the atmosphere of the sea to the very heart of the town. Around these tributaries of the Patapsco, the industrial and commercial life of the town has developed. There are more than a hundred miles of water-front, much of it in use for shipping or industrial purposes.

The original residential part of the town was close to the water front. But to-day the meadow-land which borders the river and its branches offers few attractions to the dweller who can afford to live at a distance from them. Fortunately for him, Baltimore is situated not only on deep water, but at the fall line of the Piedmont as well. Within a few hundred yards of the water-front, the land begins to rise and within a mile or two is, in many places, 100 or 200 ft. above the sea-level. To the north and west the topography is all but mountainous. There are streams in deep ravines, many of which are parked, and hills, which are the delight of the home-builder but the despair of city-planners and transportation experts.

Baltimore is approximately 9 m. from east to west and 12 m. from north to south. The area is 91.93 sq. m., of which 78.72 sq. m. are land. Within this area lives a population of 819,000 (1927). In 1920 14.8% of the native stock were negroes; of the white population the native born was just over half.

The city is governed under a grant of power from the State known as the city charter. In theory much authority still remains with the State legislature and the city is not proportionately represented in that body. Though more than half of the residents of Maryland live in Baltimore less than a third of the members of the legislature are elected by the city vote. In practice, however, the city is almost wholly master of its fiscal affairs. The legislature rarely refuses the requests of its chief municipality and has shown a tendency to be liberal even in the expenditure of funds raised by taxation.

The city government is of moderate simplicity. The chief officials are the mayor, the comptroller and the president of the city council, all elected by popular vote. These three, with the city engineer and the city solicitor, both appointed by the mayor, make up the board of estimates and, with the addition of the city register, the board of awards. The former body makes up the

annual budget and the latter awards contracts. The city council, a unicameral body with 24 members, has broad powers on paper but in practice is little more than a forum where municipal questions are publicly discussed.

The per capita cost of government is relatively low, though it has shown a tendency to grow to a point comparable to that of other cities of the size of Baltimore. In 1915, for instance, the

BY COURTESY OF THE BALTIMORE CHAMBER OF COMMERCE

A STALL IN THE FAMOUS LEXINGTON MARKET THAT EXTENDS FOR SEVERAL BLOCKS IN THE WESTERN SECTION OF THE CITY

cost per person of the city government was but \$27.44. In 1925 it had reached \$48.18 and the total expenditures of the municipality were \$39,607,000. Of the municipal services, schools were the most expensive. They cost \$9.14 per capita. Police and fire services cost \$8.04, health and hygiene \$3.56. A great part of the increase in the cost of government has been due to large capital outlay for better schools, for port improvements, for the construction of new streets and boulevards and for similar large scale undertakings. The bonded debt of the city increased from \$59,614,000 in 1915 to \$101,343,000 in 1925 and grew at a similar if not greater rate in the following two years.

Baltimore has had an unusually high death rate and despite remarkable strides since 1915 it still does not compare favourably in this respect with most northern and western cities. The rate per thousand, in 1925, was 15.6. This high average, however, was almost entirely due to the presence of a large coloured population. The coloured rate, in 1925, was 26.6, while the white rate was only 13.9. The living conditions among the coloured folk have improved, however, and comparative figures show that their emergence from poverty has been reflected in the mortality tables.

History.—It took Baltimore a long time to get under way. From the early days of the colony established on the Chesapeake by the Lords Baltimore, it had been planned to build a city called by their name. Two abortive efforts were made to establish towns and both of them were called Baltimore, but the very site of one is now doubtful and of the other but a single house and a few ruins remain. It was in 1729, finally, that the provincial legislature directed seven commissioners to purchase land on the north shore of the Patapsco river and lay out a township at the point where Jones falls emptied into the river. This choice proved to be a happy one and the town grew with fair rapidity gradually absorbing surrounding villages including especially Jones town, a hamlet on the other side of Jones falls. Even to-day Jones town, which is included in the district known locally as Old Town, has a character and quality of its own, and the names one sees on the shops are not infrequently those of the descendants of the original villagers. Baltimore's site was well chosen because the deep tidal waters on which it lay cut deep into the heart of the rich grain and tobacco lands which lie around the head of the Chesapeake bay. These lands were being rapidly developed by the German immigrants of the time and in the 1750's, or thereabouts, ships began to load grain in Baltimore harbour for British ports. The business thus established has never left the city, though now the field from which the city draws its grain for shipment is the

whole Mississippi valley. By the time of the outbreak of the Revolutionary War, Baltimore had a population of 6,755, part of this growth being due to the influx of the Acadians who had been driven out of Nova Scotia by the British. French town is still a remembered section of the city. During the Revolution, the city grew rapidly in importance. It had developed a hardy breed of sea-faring men and many privateers were fitted out and sailed from its harbour to prey upon British shipping. One of the most famous of these adventurers was Joshua Barney, who had the distinction of having commanded a ship on a trans-Atlantic voyage at the age of 14. It was the men trained in this war and in the war of 1812 who developed that type of early American ship known all over the world as the Baltimore clipper. The "Anne McKim" was the most famous of these vessels, and the fortune which she helped to bring her owners is the basis of the wealth of one of the best-known Baltimore families of the present time.

Baltimore's part in the Revolution, however, was not confined to privateering. The city supplied more than its quota of Continental troops and after the capture of Philadelphia by the British in 1776 it was for a time the meeting place of the Continental Congress. During the Revolution also, the first fortifications were erected on the present site of Ft. McHenry, but that place did not acquire fame until it helped to turn back the British fleet which

BY COURTESY OF THE BALTIMORE CHAMBER OF COMMERCE

BALTIMORE STREET, THE MAIN EAST AND WEST THOROUGHFARE AND ONE OF BALTIMORE'S MOST MODERN BUSINESS STREETS

sailed up the Patapsco in 1814 and so inspired Francis Scott Key to write "The Star-Spangled Banner."

Baltimore became an incorporated town in 1797, and after taking its part in the war of 1812, settled down to the cultivation of its trade and its industry. Its relations with the South have always been close and it considered itself a Southern city. It became the recognized market place of the planters of Virginia and points even further afield. Perhaps its most interesting period is that lying between the close of the war of 1812 and the outbreak of the Civil War. Trade was thriving. Industry was develop-

ing. The political parties held their conventions as a matter of course in the city. The burghers thereof, becoming wealthy, aspired to culture. Their sons and daughters intermarried with the land-owning gentry of the surrounding country and of Virginia. They had courage and initiative. When the building of the Erie canal made their own efforts seem puny and threatened to divert to New York all the produce of the region beyond the Alleghany mountains, they conceived and built the Baltimore and Ohio railroad whose ambition was to cross the mountains and go all the way to the Ohio river. Most of the legends and heroic tales of Baltimore, which are passed on from generation to generation, date from this period. But the political struggles of the '50s cast a blight over the city. Political disorders became rampant. The Know-Nothing Party got a grip on the life of the town. The election of Abraham Lincoln and the outbreak of the Civil War brought the disruption to a climax. There was a period of wild disorder and then military occupation. For five years and more Baltimore was held by the Federal troops and every established routine of life and trade was interrupted or broken. These were Baltimore's darkest days and their effects were felt for decades after the war had been finished.

Up to the time of the great fire of 1904, the physical aspect of the town was almost exactly what it had been at the close of the Civil War. There had been growth, but there had been little real development. The streets were paved mostly with cobble stones. There was hardly a sewer in the town worthy of the name. There were cesspools in nearly every back-yard and open drains in every street. The drinking water was contaminated and the typhoid rate was high.

Baltimore had always been a solidly-built town. Nearly every one, rich and poor, lived in a house in a block. The usual house was red brick, with white marble steps. There were miles upon miles of street lined on each side with these little Georgian edifices. Business was largely individual. There were many firms which boasted they had remained in the same premises for nearly a century. The warehouses in which they carried on their operations were simply the brick residential houses on a somewhat larger scale. In those days, while its manufactured products covered a wide range, Baltimore was essentially a commercial rather than an industrial town. Its chief business was jobbing and the South was its chief customer. Southerners came to Baltimore by the various ship lines which ran up and down the Chesapeake bay and the town in aspect, as in behaviour, was essentially Southern.

The great fire broke out on Feb. 7, 1904, and with the exception of one or two of the sort of structures then called "sky-scrapers" and several banks which had been erected with unusual solidity, few buildings survived. Most of the great changes in the city began at that time. Some of its narrow, tortuous streets were widened and, after some delay, sewers were installed and modern paving laid. A few years later, a modern system for the purification of the water supply was installed. Meanwhile, a change had taken place in the architecture of the city. The old red brick Georgian houses disappeared, and with them went a lot of the old charm. Baltimore became a more bustling, more efficient, more strident city than it had ever been before.

For a hundred years, perhaps, the wealth and fashion of the town had promenaded every afternoon along the length of Charles street. Hereon faced the smartest shops, the restaurants, the clubs, the hotels. Here, at its intersection with Monument street rose the tall Doric column which serves as a memorial to George Washington and which gave the city its one-time cognomen of "the Monumental city." On the cross-shaped square about the monument were the houses of the richest and most exclusive residents of the city. This was the very heart of fashionable Baltimore. But the residents have moved to the smart new suburbs to the north of the town. The middle classes have been spreading out in other directions. To the west and north-west are miles and miles of cottage and bungalow "developments." The remaining houses in the centre of the town, bereft of their former owners and their former state, tend to become first lodging houses, then "converted" flats and finally, the abodes of small businesses. Great

areas have been taken over by the negroes, who formerly lived in the alleys behind the larger houses. Occasionally one of these blocks has been taken over for an apartment house, a department store, or an office building.

Industries.—This change in outward aspect reflects a profounder change that has been going on in the economic structure. The old Baltimore was singularly self-contained. It was a port, but its great days as a port had passed with the passing of the Baltimore clipper. The two trunk line railroads which had their terminals there—the Baltimore and Ohio and the Pennsylvania—

BY COURTESY OF THE BALTIMORE CHAMBER OF COMMERCE
MONUMENT SQUARE, BALTIMORE. SHOWING THE COURT HOUSE ON THE LEFT AND IN THE CENTRE THE BATTLE MONUMENT ERECTED IN MEMORY OF THOSE WHO FELL IN THE WAR OF 1812

handled for the most part bulk cargo, like coal and grain. The ordinary citizen was hardly conscious of the fact that the town was a seaport, for the big ships rarely came into the inner harbour. It was during the World War that large scale manufacturing business became the rule in Baltimore. There are in the city and immediately around it great steel plants, chemical and fertilizer works, copper works and similar heavy industries, each of which has drawn into its orbit great hordes of workers of a type with which the city was hardly familiar in the pre-War days. Many of these industries are not the result of local initiative, but of outside capital, drawn to Baltimore by its location on deep water and its rail facilities and by the fact that it is closer to the West than any other of the great seaports. As a result of these developments Baltimore is in much closer relation with the rest of the country and especially with New York, than ever before.

To a greater extent, perhaps, than most people believe, Baltimore is tributary to New York. The only really great industrial enterprise which owes its being to Baltimore initiative and Baltimore capital is the Baltimore and Ohio railroad. That corporation usually has been loyal to the city of its birth and given Baltimore some consideration in all its plans for development. But the Pennsylvania railroad inevitably considers Baltimore as a subsidiary outlet, rather than a prime terminal. The Western Maryland and the Maryland and Pennsylvania, the two other independent steam roads operating out of Baltimore, are more local in character. The last mentioned has not even tide-water terminal facilities.

Other great industries which operate in Baltimore, such as the Bethlehem Steel company and the United States Industrial Alcohol company, are controlled in New York. Exceptions are found in some of the chemical companies, particularly those engaged in the manufacture of fertilizers, but even in this group many that were formerly independent are now units in some national corporation. The centre of gravity of all such undertakings is inevitably found in New York.

Note should be made here of one great exception to the general rule. There is a business, though not an industry, which originated in Baltimore and has always centred there. This is the so-called surety business. One of the original American companies for bonding employes was organized in Baltimore in 1890. Even after

the inevitable combinations, there were in 1928 still three large fidelity and casualty companies in the city doing, in the aggregate, more than \$75,000,000 of business a year.

In 1904 there were 2,158 manufacturing plants in Baltimore, employing 65,000 workers and with a payroll of \$25,507,000 and a product valued at almost exactly \$150,000,000. In 1925 the number of plants had dwindled to 2,015—excluding those with an annual product whose value was less than \$5,000—but the number of workers had increased to 85,797, the payroll to \$93,612,000 and the products were valued at \$678,947,000. Nor do these figures tell the complete story, for several of the largest manufacturing, like the Bethlehem Steel company, are situated just beyond the city's limits. When it comes to detail the official figures are likely to be even more misleading, for they do not list those industries which are represented in the city by a single corporation. Sugar and copper are two of the most important of the city's products, but in the list supplied from official sources, clothing leads. The table of leading industries (1925) was as follows:

Item	Value \$
1. Clothing	69,361,000
2. Slaughtering and meat packing	37,477,000
3. Printing and publishing	25,411,000
4. Fertilizer	23,090,000
5. Foundry and machine shop products	20,472,000
6. Bread and other bakery products	18,805,000
7. Cars and general shop construction and repairs by steam railroad companies	17,476,000
8. Furnished goods, men's	12,193,000
9. Boxes, paper	12,109,000
10. Canning and preserving fruits and vegetables	11,152,000

The statistics which show the development of Baltimore as a port are more interesting and perhaps more significant. In 1900 the port handled 7,941,580 tons of cargo. In 1926 the figure had reached 22,906,205 tons.

In 1900 Baltimore was a great shipping port for agricultural products. For obvious reasons much of this business has since disappeared. Corn exported in 1900 was valued at more than \$18,000,000. In 1926 corn worth less than \$3,000,000 left the port. During the same period oats declined from \$1,300,000 to less than \$400,000. Cotton declined from \$8,000,000 to less than \$1,000,000. Wheat showed a paradoxical increase, probably due to unusual conditions in Europe, but wheat flour declined from more than \$11,000,000 to less than \$3,000,000, while food animals dropped from \$5,000,000 to less than \$100,000. Less than \$1,000,000 worth of coal left Baltimore for foreign countries in 1900. In 1926 coal to the value of \$30,000,000 was shipped. Iron and steel manufactures including machinery, tools and hardware grew from \$6,000,000 to \$25,000,000; copper from \$16,000,000 to more than \$32,000,000; chemicals from less than half a million to nearly a million and three quarters.

As regards imports the figures indicate a port serving a growing industrial territory. Sugar, for instance, hardly appears in the 1900 figures. It headed the list in 1926, its total value being about \$22,000,000. The same thing is true of petroleum, which was insignificant in 1900 but totalled about \$12,500,000 in 1926. No copper ores or copper manufactures were imported in 1900. In 1926 this commodity was third on the list with a value of more than \$9,500,000. Similarly there was no rubber in 1900 but the total in 1926 was about \$4,200,000, while coffee increased from \$1,800,000 to \$4,700,000. Baltimore's imports during this period shifted largely from manufactured goods to raw materials for her own and the middle western industries. There was thus a great increase in tonnage, but actually a slight decline in value.

Education.—First among the educational institutions of Baltimore is the Johns Hopkins university. The two main divisions of this, the city's proudest possession, are the university proper, which lies in a section to the north called Homewood, and the medical school, together with the hospital, on Broadway, in the eastern part of town. The relations between town and gown have been close ever since the days of Daniel Coit Gilman, the first president of the university, and the members of the faculty have almost invariably played a considerable rôle in the civic life. The gradual

development of the medical school, until it outshines the university proper, has brought into the social activities of the city a great number of physicians and research workers.

The University of Maryland, a State-supported institution, whose agricultural and undergraduate departments are situated at College park, near Washington, maintains in Baltimore its professional departments, the schools of medicine, pharmacology, dentistry and law. Third of the trio of higher educational institutions comes the Peabody Institute. As originally endowed by George Peabody, the Boston philanthropist, the institute was in three parts, a library, an art gallery and a conservatory of music. The art gallery has been abandoned; the library, insufficiently endowed, has remained, nevertheless, of considerable dignity and importance, while the conservatory, whose funds have been increased by additional bequests, now contains thousands of students.

Goucher college, formerly the Woman's college of Baltimore, is a well-equipped undergraduate school of high standing for young women with a constantly increasing enrolment. Founded (1885) by the Methodist Episcopal Church, it is now almost completely non-sectarian and ranks with the better women's colleges in the country. Loyola college (1852) is conducted by the Jesuits for the higher education of Roman Catholic youth. Its average enrolment is about 180 students. For negroes there is Morgan college (1867), an excellent co-educational institution which has a considerable endowment and a student body of about 400.

In addition to the Peabody library the city also possesses the Enoch Pratt free library, and the support of this, the chief public library of the town, has been largely taken over by the city government which appropriated \$3,000,000 (1927) for a central building to take the place of the existing plant. The Pratt library maintains 27 branches in various sections of the town and 68 stations. The Walters Art gallery is one of the striking private collections of the world, but it is closed during most of the year and is not a public gallery in any sense. The Maryland Institute, on the other hand, is one of the oldest art schools in the country, and while it has not sufficient gallery space to display the various collections which have accrued to it by bequest, it holds a series of exhibitions during the year, some of which are of importance.

Since private donors did not come forward to provide the city with an adequate gallery, a group of individuals formed, finally, the Baltimore museum of art and set up a tiny collection in one of the old houses in the centre of the town. The interest aroused by this attempt emboldened them to ask for municipal support with the result that a handsome building has been put up in the northern section out of funds provided by the taxpayers.

(H. Ow.)

BALTIMORE AND OHIO RAILROAD COMPANY, THE, had its inception in a meeting held at the home of George Brown, banker, Baltimore, Md., on Feb. 12, 1827, to consider means of restoring to Baltimore the trade which the recently opened Erie Canal was diverting. A committee was appointed to investigate, recommending on Feb. 19, 1827, that a charter be obtained from the Legislature of Maryland to incorporate a company to construct a "double railroad" from Baltimore to the Ohio river. On Feb. 28, 1827, a charter, under which the railroad still operates, was granted. A company was then organized and on July 4, 1828, the "first stone" was laid by the Grand Lodge of Masons of Maryland, Charles Carroll of Carrollton, the last surviving signer of the Declaration of Independence, participating in the ceremony. On May 22, 1830, the first division of the road was opened to Ellicott Mills, 14 m. distant from Baltimore, horses being used for motive power. On Aug. 30, 1830, an experiment with its first steam locomotive, "Tom Thumb," proved successful and steam was then decided upon as the best power for operating the railroad. Wheeling, W. Va., was reached on Dec. 25, 1852, St. Louis in 1857, Chicago in 1874 and Philadelphia in 1886.

The one hundredth anniversary of its charter was celebrated by a dinner given by the president and directors of the company in Baltimore on Feb. 27, 1927, and also by an Exposition and Pageant held in the fall of the same year, the latter being attended by over a million and a quarter of people during its continuance of three weeks.

CHARLES STREET LOOKING NORTH

Baltimore at the intersection of Charles and Baltimore streets, showing Charles street, dividing the city east and west, and Baltimore street, dividing it north and south. On the extreme left of the picture, is shown in the foreground the Baltimore Sun building, beside the Baltimore and Ohio railroad building. The structure in the foreground on the right is the Savings Bank of Baltimore, and next to that is one of the city's largest department stores. From an etching by Anton Schutz

From a road of 14 m. in 1830 it has grown to 5,638 operated miles in 1928, with an investment of \$862,804,007 and a capitalization of \$817,164,174. Gross earnings in 1927 were \$246,018,000. (D. W.)

BALTIMORE PIKE, a highway running from Port Jervis, New York, to Baltimore, Maryland, is about 220m. long and paved or improved throughout its course. This road passes by Delaware Water Gap, where the Delaware river has hollowed out of solid rock a 1,600ft. gorge, and goes through Media, the home of the oldest court-house in Pennsylvania. It weaves its interesting way through the Brandywine battlefield, over the great hydro-electric power dam at Conowingo on the Susquehanna river and then crosses the Mason and Dixon line into Maryland. Stroudsburg, Bethlehem, Philadelphia and Bel Air are some of the cities through which it passes.

BALTZAR, THOMAS (c. 1630-1663), German violinist, was born at Lübeck. He visited England in 1656 and made a great impression on Evelyn and Anthony Wood. In 1661 he was appointed leader of the king's famous band of 24 violins, but his intemperate habits cut short his career within two years. Nothing like his violin-playing had ever been heard in England before, and in all probability the instrumental music of Henry Purcell owes much to its influence.

BA-LUBA, a Bantu negroid race of Central Africa with several subdivisions. They live between Lakes Tanganyika, Mweru and Bangweulu in the east and the Kasai in the west. In the east, where there is the greatest racial purity, they founded the States of Katanga, Urua and Uguha; in the west they have intermixed to some extent with the Ba-Kete aborigines. To the western Ba-Luba the name Ba-Shilange has been given. The Ba-Luba are connected with the founders of the great Lunda empire—now divided between Belgian Congo and Angola—under a monarch entitled Muata Yanvo (Jamvo). In 1870 a remarkable politico-religious revolution occurred, the result of which was the establishment of a cult of hemp-smoking, connected with a secret society termed *Bena Riamba*; the members of this abandoned their old fetish worship and adopted a form of communism of which the central idea was the blood-brotherhood of all the members. Towards the east hemp-smoking becomes less common.

The Ba-Luba practise circumcision and scar-tattooing is common; tooth-filing is very frequent in the east, but comparatively rare in the west; the fashion of dressing the hair is very varied and often extremely fantastic. Their houses, which are built by the women, are rectangular; on the Lulua, however, pile-houses, square in shape, are found. They are an agricultural people, but work in the fields is relegated to the women and slaves; the men are admirable craftsmen and are renowned for their wood-carving, cloth-weaving and iron-work. In the west, bows and arrows are the chief weapons, in the east spears principally are used. The old form of religion still obtains in the east, which was untouched by the communistic movement mentioned, and charms of all sorts, as well as carved anthropomorphic figures, are extremely common.

See M. W. Hilton Simpson, *Land and Peoples of the Kasai* (1911).

BALUCHISTAN (bā-loo-chī-stahn'), a country within the borders of British India which derives its name from its chief inhabitants. It extends from the Gomal river to the Arabian Sea, and from the borders of Persia and Afghanistan to those of Punjab and Sind. It is divided into two main divisions, British Baluchistan, which is a portion of British India under the chief commissioner, and the foreign territories under the administration of the same officer as agent to the governor-general. The former portion, with an area of 9,096 sq.m., consists principally of tracts ceded to the British government by Afghanistan under the treaty of

Gandamak (1879), and formally declared to be part of British India in 1887. The second class comprises three subdivisions: areas directly administered, native states and tribal areas. Of the directly-administered districts some portions are held on lease from the khan of Kalat, while others are tribal areas in which revenue is taken. They include the whole of the Zhob and Chagai political agencies, the eastern portion of the Quetta tahsil and other tracts, among which may be mentioned the Bolan Pass, comprising 36,401 sq.m. in all. The whole of the northern boundary, with the north-eastern corner and the railway which traverses Baluchistan through Quetta up to New Chaman on the Afghan-Baluch frontier, is therefore in one form or other under direct British control. The remainder of the territory (80,410 sq.m.) belongs to the native states of Kalat (including Makran and Kharan) and Las Bela. Tribal areas, in the possession of the Marri and Bugti tribes, cover 7,129 sq.m. The centre of the country is traversed by a broad gauge railway from the Indus to New Chaman on the Afghan frontier. The main line runs through Sibi at the foot of the Sulimans up to the Quetta plateau via the Mushkaf Valley. An alternative loop runs from Sibi on a north-easterly alignment via Harnai, joining the main line north of Quetta at Bostan. From Spezand, 17 m. S. of Quetta, a branch runs south-west to Nushki.

Baluchistan as a whole is a sparsely populated country, larger than any Indian province save Burma, Madras and Bengal (area, 134,638 sq.m.; population [1921] 799,625). Three hundred miles of its mountain walls facing the Indus are south of the railway from the Indus to Quetta, and about 250 north of it. The great break in the curving mountain lines about Sibi, and its extension in the passes followed by the railway, divide Baluchistan into two distinct parts. To the north, hedged in between Afghanistan and the plains of the Indus, stretch the long ridges of rough highlands which embrace the Suliman system, where vegetation is often alpine. The average breadth of this northern Pathan district is 150 m., but it narrows to less than 100 m. on the line of the Gomal. South of the railway lies a square block of territory, measuring roughly 300 m. by 300, primarily the home of the Brahui and the Baluch, but with great variety in physical conditions and in inhabitants. In the Jalawan the streams run in deep gorges eastwards into the plains of Sind. South of the Jalawan highlands the rivers either run in long straight lines to the Arabian Sea or, curving westwards parallel with the mountain arcs,

KALAT WITH THE PALACE OF THE KHAN

Nominally all the provinces of this mountainous country, with the exception of British Baluchistan, are under the Khan of Kalat, but so many tribes and nationalities make up the population that whether his suzerainty could be maintained without British help is very doubtful. The Khan's revenue consists partly of agricultural levies and partly of subsidies

disappear into inland swamps. A narrow coastal strip, including Makran, discharges its waters into the Arabian Sea. Between southern Baluchistan and the north-easterly lobe comes the wedge-shaped desert of Kach Gandava (Gandava), which is thrust westwards from the Indus as a deep indentation into the mountains, and, above it, the central uplands of "British Baluchistan." All Baluchistan has now been surveyed.

Northern.—From Domandi, at the junction of the Gomal and Kunder, the boundary on the side of Afghanistan follows the Kunder stream for about 40 m. to the south-west. It then diverges

northwards for about 100 m., striking the Kadanai river and turning the northern spurs of the Toba Range to wind through the open plains west of the Kojak Range (Khwaja Amran). It returns to the hills 40 m. S. of Chaman, and thenceforward is defined by hill ranges southwards to Nushki. The eastern boundary of this northern section of Baluchistan is the "red line" at the foot of the frontier hills, which defines the border of British India. The occupation of a line of posts on the Zhob river, which flanks the Suliman range on the west, places the doors of communication with Afghanistan in British hands.

The central range of the Suliman hills is the dominant feature in the geography of northern Baluchistan. Towards the north of the range occurs a group of peaks, which form an oblong "massif" known as "Kaisargarh" or, more generally, as the "Takht-i-Suliman" (Solomon's throne), from a celebrated shrine of that name near its southern abutment. This high tableland (about 8,000 ft. above sea-level) is formed by a huge cap of coral limestone, estimated to be from 4,000 to 5,000 ft. thick. Deep gorges, with mighty precipices, form the channel of the Draband or "Gat" on the north, and of the Dhana on the south. The higher slopes of the plateau have a fairly thick growth of the chilghosa or "edible" pine and a sprinkling of juniper. It is bounded east and west by high, rugged parallel ridges. The western ridge culminates on the north in the peak of Kaisargarh (11,300 ft.), and the eastern in a block, or detached headland, on the south, where rests the immortal "ziarat" or shrine (11,295 ft.), which attracts thousands of pilgrims (Mohammedans and Hindus) yearly. To the west is the Shingarh Mountain, a geological repetition of the Kaisargarh ridge, black with pines towards the summit. Beyond it are the grey outlines of the close-packed ridges which enclose the lower reaches of the Zhob and the Kundar. The upper parts of the Zhob valley towards the mountain knot north of Quetta are comparatively open and fertile, with flourishing villages, and are bounded by long, sweeping, gentle spurs clothed with wild olive woods. The lower reaches of the Zhob and Kundar are hemmed in by rugged limestone walls, with deep gorges forming a stony wilderness. The parallel ranges of the Sulimans end eastwards in the high ridge of the Siwaliks, facing the Indus plains. Between the Takht Mountain and the Siwaliks is a belt of transverse drainage with valleys cut as the hills gradually rose above the plain level. Beyond the Siwaliks are the sand waves of the Indus plain; a yellow sea broken here and there with the shadow of village orchards, extending to the long fringe of trees bordering the Indus. All this northern section is independent Baluchistan within the jurisdiction of the Baluchistan Agency, with the exception of certain clans of the Sheranis on the eastern slopes of the Takht-i-Suliman north of the Vihowa, who are under the North-West Frontier Province administration and consequently separate from the Northern Section.

As the Sulimans approach the Quetta railway they turn westward and merge in the broad mountain core which hedges in the uplands of Quetta and Pishin, and here are some of the grandest peaks in Baluchistan. Khalifat (11,440 ft.), south of Ziarat, flanking the Harnai loop of the Sind-Pishin railway; Takatu to the north of Quetta; Chahikan (Chikan) on the south-west; and the great square-headed Murdar to the south. Lying in the midst of them, on an open plain formed by the high-level tributaries of the Lora, 5,500 ft. above the sea, is Quetta. The southern end of the Suliman system, is occupied by true Baluchis, the Marri and Bugti sections of the great Rind confederation of tribes owning an Arabic origin. There are no Pathans. To the north of them are the Bozdars, another Rind clan; and these Rind tribes form the exception to the general rule of Pathan occupation of northern Baluchistan. Amongst the Pathans, the Kakars and Dumars of Pishin, with the Mando Khel of Zhob, are the most prominent tribal divisions.

A CHARACTERISTIC BALUCHI

Central.—The curved recession of the Suliman Ranges to the north-west leaves a flat alluvial desert to the south, striking deep into the Baluchistan mountain system. The point of this inlet receives the drainage of two local basins, the Bolan and the Nari. Their waters finally disappear in the irrigated flats of the alluvial bay (Kach Gandava), which extends 130 m. from the Indus to Sibi at the foot of the hills, and which offers (in spite of periodic Indus floods) a unique opportunity for railway approach to Baluchistan. Kach Gandava is a land of dust-storms and ruinous winds; a land where the thermometer never sinks below 100° in summer, and drops below freezing-point in winter.

British.—The irregular block of upland territory known as British Baluchistan includes all the upper Lora tributaries, and the Toba plateau beyond them; resting on the Khwaja Amran (Kojak) Range on the west; reaching south to Nushki; including the basins of the Bolan and Nari as far as Sibi to the south-east; embracing the Thal Chotiali valley on the east, and following the main water-divide between the Zhob and Lora on the north. It is leased from Kalat, and forms a distinctive province, under the ordinary civil administration of British India. Beyond it, north and south, lies independent Baluchistan which is under British political control. The degree of independence enjoyed by the various districts of Baluchistan increases with the distance from Quetta. The climate of British Baluchistan is dry and bracing and, though subject to extremes of temperature, is on the whole favourable to European life.

Southern.—The square block of Southern Baluchistan, with its mountain folds opening fanwise from the Kalat plateau, naturally drains south and west, either to the Arabian sea or to the central swamps of Lora and Mashkel. The Hab river, which forms the boundary west of Karachi; the Purali (the ancient *Arabus*), draining the low-lying flats of Las Bela; the Hingol (the ancient *Tomerus*) and the Dasht in Makran, are all considerable streams, draining into the Arabian sea and forming important arteries in the network of internal communication. An exception to the general rule is found in the Mula, which carries the floods of the Kalat highlands through magnificent gorges into the Gandava basin and forms one of the most important of the ancient highways from the Indus plains to Kandahar. The fortress of Kalat (6,800 ft.) is situated between the sources of the Bolan and the Mula, near a small tributary of the Lora on the western edge of a cultivated plain in the very midst of hills (*see* KALAT). To

A WAYSIDE COBBLER OF BALUCHISTAN

The stony hill-roads of Baluchistan make the business of the cobbler lucrative

the north are the long sweeping lines of the Sarawan ridges, enclosing narrow fertile valleys, and passing south-west to the edge of the Kharan desert. Some streams drain northwards as affluents of the southern Lora; but the Lora drains also the Pishin valley on the north, the two systems uniting in Shorawak, to lose themselves in the desert and swamps to the west of Nushki, on the road to Seistan. Sixty miles south of Kalat begins the remarkable hydrographic system which includes all southern and south-western Baluchistan. To the west lies the Kharan desert, with intermittent river channels often lost in the sand-waves ere they reach the Mashkel swamps on the far borders of Persia. To the south-west are the long sweeping valleys of Rakshan and Panjgur, which, curving northwards, likewise discharge into the Mashkel. Directly south come the meridional arteries, the Hab, the Purali and the Hingol, which end in the Arabian Sea, leaving the mountainous seaboard (Makran) south of the Panjgur and west of the Hingol poorly watered by the long lateral Kej river and several smaller mountain streams. The eastern frontier of southern Baluchistan over against the desert of Sind follows the foot of the Kirthar range, whose limestone walls rise sheer for thousands of feet.

Western Boundary.—The boundary between Baluchistan and Afghanistan runs westwards from near Nushki across the Lora Hamun, leaving the frontier post of Chagai to Baluchistan; and from this point to the Koh-i-Malik Sia it is based partly on the central water-divide of the Chagai Hills and partly runs in straight lines through the desert south of the salt swamps of the Gaud-i-Zirreh. It thus passes 50 m. to the south of the Helmand, entirely shutting off from Baluchistan the approach to Seistan north of the Gaud-i-Zirreh. The route to Seistan from Nushki thus runs south of the Chagai Hills. Towards the end of the World War, when the North Persian Cordon was established to Meshed, to keep Turks from Afghanistan, and to connect with the Anti-Bolshevik element in Russian Turkestan, the rail was extended along this line to Duzdap (439 m. beyond Nushki and 52 m. into Persia) but was pulled up later.

Geology.—The mountain ranges of Baluchistan are formed of Cretaceous and Tertiary beds, and constitute part of an extensive system of Tertiary (Alpine-Himalayan) date arranged as if in a festoon hanging southwards between Peshawar and Mount Ararat, with the outer folds looped up at Sibi so as to form the subsidiary festoon of the Suliman and Bugti hills. Outside the folds lie the horizontal deposits of Makran, and within them lies the stony desert of north-western Baluchistan. Besides the Cretaceous and Tertiary beds, Jurassic rocks occupy considerable areas in British Baluchistan. Triassic beds lie along the south side of the upper Zhob, and *Fusulina* limestone has also been found there. With the exception of the later Tertiary beds the deposits are mostly marine. But in the upper Cretaceous and lower Tertiary, especially in north-western Baluchistan, there is an extensive development of volcanic tuffs and conglomerates, probably contemporaneous with the Deccan Traps of India. Great masses of syenite and diorite were intruded during the Tertiary period, and within the curve of the folded belt a line of recent volcanic cones stretches from western Baluchistan into eastern Persia.

So far as is known, the mineral wealth of Baluchistan is considerable. Coal has been worked in the Tertiary beds along the Harnai route to Quetta, but the seams are thin and the quality poor. A somewhat thick and viscid form of mineral oil is met with at Khattian in the Marri country; and petroleum of excellent quality occurs in the Sherani hills. Traces of oil have been found at various spots, without any sign of accessible large supplies. Sulphur has long been worked on a small scale in the Koh-i-Sultan, the largest of the volcanoes of western Baluchistan. Chrome is profitably worked near Pishin and a light line from Khanai to Hindubagh was laid in 1916 for the chrome traffic.

Races.—Baluchistan presents a remarkable field for the ethnographer. In the desert are to be found scattered tribes of nomads, called *Rekis* (or desert people), the Muhammadani being the most numerous. They are probably of Arab origin. This central desert is the Kir, Kej, Katz or Kash Kaian of Arabic mediaeval geography, and a part of the ancient Kaiani kingdom; the prefix Kej or Kash denoting low-level flats or valleys. The Muhammadani nomads occupy the central mountain region, to the south of which lie the Mashkel and Kharan deserts, inhabited by a people of quite different origin, who possess something approaching to historical records. These are the Naushirwanis, a purely Persian group who passed into Baluchistan within historic times. They appear to be identical with the Tahuki or Tahukani who are found in Perso-Baluchistan, and are a fine manly stock. Between the Naushirwanis and the fish-eating population of the coast, enclosed in the narrow valleys of the Rakshan and Kej tributaries, or about the sources of the Hingol are innumerable tribes some of which are of long-standing, while others may be traced in the records of recent immigration. Almost everywhere recognizable is the underlying Persian population (Tajik), which is sometimes represented by a locally dominant tribe, but more frequently by the agricultural bondsman. Such are the Dehwaris or Dehkans, and the Durzadas who extend all through Makran. The Arabs have naturally left their mark on the ethnography of Baluchistan. As they occupied all southern Baluchistan and Seistan from a very early date, and finally spread through the Sind valley, where they remained till the 12th century, their genealogical records have

become much obscured. Makran contains numerous relics of their irrigation works constructed in times when the climatic conditions of Baluchistan must have been very different from what they are now. Lower Sind also contains a great wealth of architectural remains to the west of the Indus as well as in the delta. One tribe (the Kalmats), who left their name on the Makran coast and subsequently dominated Bela and Sind, west of the Indus, exhibit great power of artistic design in their sepulchral monuments. The

WATCH TOWER NEAR THE KHOJAK PASS, BALUCHISTAN

Built in the village street to protect the community against marauders

Dravidians (Brahuis), who are chiefly represented by the Kambaranis and Mingals or Mongals (the latter doubtless of Tatar origin), spread through southern Baluchistan as well as the eastern hills, and are scattered throughout the mountain tracts south of Kharan. The Bolédis, who are mentioned by very early writers, were once the ruling race of southern Baluchistan, which was originally called Boledistan, and it seems possible that this may be the real origin of the much-disputed name of the country. The fast-diminishing Sajidis (Sajitae) and Saka (Sacaë) are others of the more ancient races of Baluchistan easily recognizable in classical geography. Most recent of all are the Gitchkis, who derive from a Rajput adventurer of the early 17th century. They are now the dominant race in Panjgur and Kej, whence they ousted the Boledis. An interesting group are the Gadaras of Makran, who once gave the name Gadosia to Southern Baluchistan. They are now mostly represented by Sidi half-castes, well known in the mercantile marine as stokers and firemen. It seems unlikely that this modern admixture of Asiatic and African blood represents the "Asiatic Ethiopian" of Herodotus which was more probably a direct connection of the Himyaritic Arab builders of "bunds" and revetments who spread eastwards from Arabia.

Peoples of Arab extraction intermixed with peoples of Dravidian and Persian stock are all designated by the general term Baluch. The Marri and Bugti tribes, who occupy the most southern buttresses of the Suliman Mountains, are Rind Baluchis, almost certainly of Arab extraction and claim to be Qoraish. They came to Sind either with the Arab conquerors or after them, and remained there mixed up with the original Hindu inhabitants. The Arab type of Baluch extends through the whole country at intervals and has some fine traits. The Baluch is easier to deal with and to control than the Pathan owing to his tribal organization and his freedom from bigoted fanaticism. He is an expert rider; horse-racing is his national amusement, and the Baluch breed of horses is celebrated throughout northern India.

The strategical position of Great Britain in Baluchistan is a very important factor in the problem of maintaining order and good administration in the country. The ever-restless Pathan tribes of the Suliman hills are held in check by the occupation of the Zhob valley; whilst the central dominant position at Quetta safeguards the peace and security of Kalat and bars the way to an advance upon India by way of Kandahar.

Climate.—Extensive changes have taken place in the climatic condition of the country, as is shown by the remains of forests in districts now entirely desiccated. Wanton destruction of forests may have been a factor but the widespread desiccation of large areas of the Baluch highlands, where evidences of Arab irrigation works and of cultivation attest to a once flourishing civilization, suggests secular climatic variations. There is ample proof throughout the country of alterations of level within recent geologic periods, and there have even been compressions resulting in a relative rise of the ground, over the crests of anticlinal folds, within historic record.

Population.—The population of Baluchistan (799,625 [1921]) is largely nomadic. The fact that so many as 15,000 camels have been counted in the Bolan Pass during one month of the annual

Brahui migration indicates the size of the movement. The prevailing religion is Mohammedan. Holders of this faith, mainly of the Sunni sect, numbered 733,477 in 1921. Hindus numbered 51,348; Christians, 6,693; Sikhs 7,741. The chief languages spoken are vernaculars of Baluchistan, Pushtu, Panjabi, Urdu and Sindhi. The Baluchi language belongs to the Iranian branch of the Aryan sub-family of the Indo-European family. It is divided into two distinct main dialects, separated by the belt of Brahui and Sindhi speakers who occupy the Sarawan and Jalawan hills, and Las Bela. Makran was for many generations under the rule of the Persian kings, and the Baluchi spoken on the west of the province is largely impregnated with Persian words. There is no indigenous literature, but many specimens of poetry exist in which heroes and brave deeds are commemorated, and a good many of these have been collected from time to time. Brahui is one of the Dravidian group of languages. It is remarkable to find in Baluchistan a Dravidian tongue, surrounded on all sides by Aryan languages, and with the next nearest branch of the same family located so far away as the Gond hills of central India; and this is said to be evidence for the route followed by the prehistoric Dravidian intrusions into India, most probably through Makran. There are thirteen indigenous tribes of Pathan origin of which the Kakars (*q.v.*) are by far the most important. They are to be found in the largest numbers in Zhob, Quetta, Pishin, and Thal-Chotiali, but there are a few of them in Kalat and Chagai also. The most important Baluch tribes are the Marris, the Bughtis, the Boledis, the Domkis, the Magassis and the Rinds.

HISTORY

The earliest mention of the country now called Baluchistan, apart from a reference in the Avesta to Vara Peshin-Anha or the Peshin Valley, is in the pages of Herodotus, who states that the Mykians—the Maka of the Behistun inscription—were included in the fourteenth satrapy of the Persian empire, as it was organized by Darius in the 6th century B.C. Makran, the name for the coastal province of Baluchistan and of neighbouring Persian Baluchistan, probably signifies "the land of the Maka." There were legends that mythical Semiramis and historical Cyrus the Great, the founder of the Persian empire, had lost armies in its deserts, but the country was not explored in any sense until the appearance of Alexander the Great, who, after his victories in India, was returning to Persia, in 325 B.C. Makran was traversed from east to west by the main body under Alexander himself, while his admiral Nearchus coasted along its shores to the Persian Gulf and kept such an accurate log that many of the ports and headlands mentioned can be identified to-day. Craterus, who had been placed in charge of the invalids and elephants, had left Alexander in the Indus delta and marched through Quetta and northern Baluchistan, rejoining Alexander in the valley of the Halil Rud, where Nearchus also reported the safe arrival of the fleet at Harmozia (the mediaeval Hormuz), to the east of modern Bandar Abbas. Arrian describes with striking accuracy the desert nature of the country, the scanty population of Ichthyophagi or "Fish-eaters" and the lack of supplies; he also refers to the aromatic plants. After the death of Alexander, his kingdom broke up and Baluchistan formed part of the kingdom of Bactria.

Baluchistan is occasionally mentioned in Persian history, after the rise of the Sasanian dynasty. For instance, Bahram Gur, who reigned in the 5th century A.D. made an expedition to India and occupied Makran. He is believed to have brought back with him some thousands of dancers who were the ancestors of the gipsies.

The province undoubtedly formed part of the Persian empire at this period and in the following century. In the 7th century, the Arabs, inspired by the teachings of Mohammed, attacked and overthrew the Persian empire, and gradually annexed its outlying provinces. We read that some Makran towns were occupied in 664 and, in 707, Mohammed bin Kasim undertook his celebrated campaign. He captured various strongholds in Makran and after making good his position in that country, he advanced into Sind

BALUCHI NATIVE HOME IN THE QUETTA DISTRICT

and established the Muslim power in the valley of the Indus. The Arabs ruled Baluchistan from Khuzdur in Jhalawan until the 10th century.

When Persia regained her independence upon the gradual weakening of the Caliphate, Baluchistan was included in the empire, but her chiefs were practically free to rule as they liked, so long as they furnished military contingents when called upon to do so. It is, however, to be noted that from 1595 to 1638 the province formed part of the Mogul empire. The Baluchis, who have given their name to the country, are comparatively new comers. Of Aryan stock, they apparently entered it as a tribe of invaders in the eleventh and twelfth centuries, being driven out of Persia by the Seljuks. They conquered Western Makran, but failed to seize the uplands of Kalat. They therefore passed them by and half of the tribe gradually seized districts in the Indus valley. The tribesmen who remained formed a race of hereditary chiefs, quite distinct from the peasantry, especially owing to their fair complexions.

Their rivals, the Brahuis, who occupy the highlands of Kalat, are of Dravidian stock. They rose to power in the 17th century under their chief Kambar, who overthrew the dynasty of Hindu rajahs and seized the country and, since this period, Muslims have been dominant throughout Baluchistan. Kambar's descendant, Abdulla Khan, conquered the fertile district of Kach Gandavar. He was a contemporary of Nadir Shah who at this period was avenging the Afghan invasion of Persia and captured Kandahar after a long siege. Baluchistan at this period was subject to Kandahar, and Abdulla submitted to the Shah, but was killed in a battle with the Nawabs of Sind shortly afterwards. His successor was incapable and was put to death by his brother Nasir Khan, who had served Nadir in his Indian campaign. He was appointed first *Beglerbegi* or "Chief Beg" of Baluchistan by his master in 1739; and thus began the long reign of the greatest ruler of this desert country, whose rule finally included several districts of Sind and what is now Persian Baluchistan. Upon the assassination of Nadir Shah in 1747, Ahmad Shah founded the kingdom of Afghanistan. Nasir Khan at first acknowledged his overlordship,

but, in 1758, he rebelled. He was defeated by Ahmad Shah in the field, but the Afghan was unable to capture Kalat and a treaty was negotiated, by the terms of which Nasir Khan agreed to furnish troops for expeditions, but was exempted from the payment of tribute. This treaty was faithfully observed, and Nasir Khan distinguished himself in many engagements, the victory of Ahmad Shah in Khorasan being mainly due to the valour and capacity of the Baluch Khan. He died at an advanced age in 1795.

At the beginning of the 19th century, the English traveller Pottinger travelled through Baluchistan and thus inaugurated British connection with it. The First Afghan War, the object of which was to restore Shah Shuja, a refugee amir, to the throne of Afghanistan, suddenly made the attitude of Kalat of some importance. British troops marched from the Indus through the Bolan pass to Kandahar, and negotiations were opened with Mehrab Khan of Kalat, mainly with a view to protect the supply columns of the army. Intrigues led the authorities to believe that the khan was guilty of attacking the British convoys, and a force was sent against him with orders to capture Kalat. The main gate was blown in by gun fire, the fort was stormed and Mehrab Khan, with 400 of his men fell fighting. Too late it was discovered that the Vizier had arranged the attacks on the convoys with the object of discrediting the unfortunate khan. Nasir, the son of the khan, was set aside at first, but the chiefs rallied to him and he was finally acknowledged by the British in 1841; they evacuated the country a few months later. The steady advance of the frontiers of British India in Sind made it desirable to have closer relations with Kalat, if only to put an end to the raids on the newly conquered territories. Consequently, in 1854, General Jacob, the commandant of the Sind frontier, was deputed to make a treaty with the khan. This was successfully negotiated, as the position of the khan had been shaken by rebellions, and he was anxious both for support and for money. The terms bound the khan "to act in subordinate co-operation with the British Government and to enter into no negotiations with other states without its consent." On condition of a faithful performance of his duties, he was granted an annual subsidy of Rs. 50,000.

Nasir Khan died in 1856 and, under his successor Khudadad Khan, a boy of twelve, there was a rebellion of the turbulent chiefs who, dissatisfied with the presents they had received on his succession, attempted to depose him. The British Government, although the Indian Mutiny was at its height at the time, deputed a British officer to reside at Kalat in 1857. The khan was wounded by his cousin, who seized Kalat and ruled for a year, when he was assassinated. The chiefs then reinstated Khudadad, who ruled precariously and was unable to control his subjects or prevent them from raiding British territory. So bad was the state of affairs that it became evident that further intervention in the affairs of the state was imperative.

In 1875, Captain Sandeman was deputed on a mission to Kalat and he succeeded in arranging the disputes between the khan and his unruly chiefs. By a treaty, negotiated in 1876, the British Government became the referee between the khan and his chiefs and thus was inaugurated the famous Sandeman system of the administration of the tribes through their own chiefs and in accordance with tribal custom, but under British supervision.

In furtherance of the defence of India, the position at the head of the Bolan pass, which included Quetta and the surrounding country, was occupied and, in 1879, by the Treaty of Gandamak, Sibi and Peshin were annexed. In 1891, Sir Robert Sandeman extended British authority over the Zhob valley, situated between Peshin and the old frontier of India. Ultimately Baluchistan was incorporated in the British empire, and its boundaries with Persia and Afghanistan were fixed by a series of commissions, the three states meeting at the peak termed Kuh-i-Malik-i-Siah, situated some sixty miles to the south of Sistan.

In 1893, the outrageous behaviour of the khan, who ill-treated his officials, necessitated his deposition and he was succeeded by his son. Some years later, it was decided to open up a trade route to Sistan and the district of Nushki was ceded by the khan, who received an annuity on this account as also for the Quetta district. The caravan route to Sistan was opened up in the face of great

physical difficulties, which included lack of drinkable water and of supplies, a predatory population and similar conditions on the Persian side of the frontier. However, thanks to British energy, a trade route was opened, which not only developed commerce, but quieted the wild tribesmen. During the Great War, the railway line, which had been extended to Nushki, was continued to the Persian frontier. (P. M. S.)

THE WORLD WAR

The frontiers of Baluchistan may be considered to be international. To the north runs the border of Afghanistan for 720m. and, to the west, that of Persia for 520m. To the south, there are 470m. of coastline on the Arabian Sea. On the east, there is a frontier 900m. in length with the Indian provinces of Sind, the Punjab, the north-west frontier, and, last but not least, the forty miles of border with Waziristan, a source of constant trouble and expense. The borders are affected by external conditions and policy, while internal conditions are affected by the position of affairs in India.

An attack on India by a Turkish army, led by German superior officers, figured prominently in the Asiatic programme of the German Government. To prepare the way for it, German missions, supported by a force, were despatched to Persia which, after driving out British officials, missionaries and business representatives from central and southern Persia by the end of 1915, used every means to promote risings and the assassination of British officials in Baluchistan. The fall of Kut in April 1916, constituted a terrible blow to British prestige, and it appeared probable that a wave of fanaticism would sweep across Baluchistan to India. Actually two British officers were assassinated in Makran through German instigation.

On the outbreak of the World War, the chiefs, following the lead of the Khan of Kalat and the Jam of Las Bela, gave demonstrations of their loyalty and offered their resources in support of the British Raj. A camel corps was raised in the Kalat State and large sums were sanctioned by the khan to protect the Persian border from raids. The Baluch and Brahui chiefs alike rendered willing service.

Owing to the disappearance of Persian authority in Persian Baluchistan, the Germans found it an excellent field for propaganda and for the organization of raids, although, of course, Kabul was their main objective. Professor Zugmeyer, German consul at Kerman, who, under the guise of a zoologist, had travelled extensively in Baluchistan some years previously, endeavoured to raise the tribes by the despatch of German emissaries to the leading chiefs in Persian Baluchistan and by letters.

To meet this danger, three separate steps were taken. (1) The despatch, in 1916, of a mission under Brigadier-General Sir Percy Sykes to restore order in South Persia and to expel the German missions. (2) The creation of a cordon along the border of eastern Persia in which connection, in 1916, Brigadier-General R. E. Dyer severely punished the Damanis of Sarhad, who had raided Baluchistan and occupied Khwash. (3) The despatch of a mission under Major T. Keyes into Persian Baluchistan. There is no doubt that these operations preserved the security of the frontier.

Internally, in 1915 and again, in the following year, expeditions were sent into Jhalawan, where there was some unrest caused by German agents from Persia as well as by disloyal and fanatical preachers from Sind. Moreover, the Marri, a difficult tribe to handle even in peace time, broke into open rebellion in February 1918, necessitating the use of a large force. It is, however, a matter for congratulation that there was no serious rebellion on a large scale in the province, and this fact proves the success of the Sandeman system.

The assassination of King Habibulla of Afghanistan in Feb. 1919, and the outbreak of the Third Afghan War in May of the same year, created a feeling of intense excitement, and it could not be expected that peace would remain unbroken. The breakdown of the militia system on the north-west frontier, and the abandonment of Wana, the key position in neighbouring Waziristan, led to Fort Sandeman, situated in the Zhob valley, being

besieged by a large force of Waziris, Mahsuds and outlaws. The bazaar was sacked, but the fort was stoutly held until relieved. The whole Afghan border seethed with excitement and there were frequent raids into Zhob, Loralai, Chagai and other districts, which caused intense anxiety. The long delay in making a definite settlement either with Afghanistan or with the Waziris, made it impossible for a time to reoccupy the abandoned posts. Under the Sandeman system, greater security, prosperity and happiness are enjoyed in Baluchistan than at any other period in its blood-stained history, while its security means much to the peace of India. (A. B. D.)

BALUCHISTAN (PERSIAN), the southern and eastern portion of the Persian province of Kirman (*q.v.*) consisting of the western part of Baluchistan (*q.v.*), in its wider sense. Persian Baluchistan covers an area of about 60,000sq m. and lying along the northern shore of the Gulf of Oman, is bounded on the east by British Baluchistan, the frontier of which was finally demarcated in 1895-96; while on the north it extends towards Seistan, and westward runs with the provinces of Fars and Kerman. It originally formed part of the khanat of Kalat, but was gradually conquered by Persia after the rise of the Kajar dynasty, and is strictly speaking the western portion of Makran and shares its physical characteristics. The country has little water and only a very small part of it is under cultivation, the remainder being composed of arid plains, deserts and a labyrinth of mountains which in places attain an elevation of 6,000ft. The rivers flowing into the sea are unimportant and dry during part of the year. It is sparsely inhabited, but the limits of the region are too vague for any precise estimate to be made of its population. The district enjoyed a quasi-independence until, in the reign of Mohammed Shah (1834-44), a chief of Bampur attempted a raid into Kerman and was overcome. In 1849 a rising again took place, when Bampur itself was taken and since that time has been held by Persia. The principal ports are Charbar and Jask; the principal towns, Bam (*q.v.*), Bampur (*q.v.*), Bijn, Fanoch and Kaih.

BALUE, JEAN (c. 1421-1491), French cardinal and minister of Louis XI., was born of very humble parentage at Angie in Poitou. He became almoner to Louis XI., in 1465, bishop of Evreux, and in 1468 cardinal. But in that year Balue was compromised in the king's humiliation by Charles the Bold at Péronne and excluded from the council. He then intrigued with Charles against his master; their secret correspondence was intercepted, and on April 23 1469, Balue was thrown into prison, where he remained eleven years, but not, as has been alleged, in an iron cage. In 1480, through the intervention of Pope Sixtus IV., he was set at liberty, and from that time lived at the court of Rome. He received the bishopric of Albano and afterwards that of Palestrina. In 1484 he was even sent to France as legate *a latere*. He died at Ancona in 1491.

See Henri Forgeot, "Jean Balue, cardinal d'Angers" (1895), in the *Bibliothèque de l'école des hautes études*.

BALUSTER (sometimes incorrectly written "banister"), one of a series of small posts supporting the coping or hand-rail of a parapet or railing. Colonnets are shown as balusters in Assyrian palaces by contemporary bas-reliefs and are similarly used in many railings of the Gothic period. Although no Greek or Roman example of the baluster is known, the Italian Renaissance designers made great use of it, employing, instead of the mediaeval colonnette, forms richly moulded and usually round. The Renaissance balusters generally had a capital, a base and a vase-shaped form between. In early Renaissance work a form similar to two vases set base to base is frequent. The later Renaissance architects codified balusters into orders like columns, and those of the Baroque went to the other extreme of fantasy in baluster form.

The term baluster shaft is used of any similar vertical shaft such as those which are to be found dividing the windows in Saxon work.

BALUSTRADE, a parapet or railing (often merely decorative), consisting of a coping or rail supported by balusters (*q.v.*). In Renaissance balustrades the balusters are usually divided into groups by the interposition of a large square post or pedestal. The word is incorrectly used for any masonry rail.

BALUZE, ÉTIENNE (1630-1718), French scholar, was born at Tulle on Nov. 24, 1630, and died in Paris on July 28, 1718. The works which place him in the first rank of the scholars of his time are the *Capitularia Regum Francorum* (1674; new edition enlarged and corrected in 1780); the *Nova Collectio Conciliorum* (1677); the *Miscellanea* (1678-1715; new edition revised by Mansi, 1761-64); the *Letters of Pope Innocent III* (1682); and, finally, the *Vitae Paparum Avenionensium, 1305-94* (1693).

But he was unfortunate enough to take up the history of Auvergne just at the time when the Cardinal de Bouillon, inheritor of the rights, and above all of the ambitious pretensions of the La Tour family, was endeavouring to prove the descent of that house in the direct line from the ancient hereditary counts of Auvergne of the 9th century. The documents forged to support the cardinal's claim by Jean le Bar deceived many great scholars, but were declared spurious by the courts in 1704. Nevertheless, in two works published in 1705 and in 1709 Baluze made use of the forged documents. Baluze was deprived of his appointments and compelled to leave Paris, though he was allowed eventually to return.

The history of the forgeries committed in the interests of the house of Bouillon forms a curious and instructive episode in the history of French scholarship in the time of Louis XIV. It is to be found in the *Manuel de diplomatique* by A. Giry; and above all in a note to the *Oeuvres de Saint-Simon* by M. de Boislisle (vol. xiv. pp. 533-558). The bibliography of Baluze's researches has been made by M. René Fage (1882, 1884) and his *Life* told by M. Émile Fage (1899). To these we must add an amusing book by G. Clément-Simon, *La Gaîté de Baluze; documents biographiques et littéraires* (1888). Baluze's will has been published by M. Léopold Delisle (*Bibliothèque de l'École de Chartes*, 1872); his papers are now in the Bibliothèque Nationale in Paris, and in the Bibliothèque de l'Arsenal (*Revue historique*, t. xcvi. p. 309). See also the article by Arthur de Boislisle in the *Revue des questions historiques* for Oct. 1908. (C. Bz.)

BALZAC, HONORÉ DE (1799-1850), French novelist, was born at Tours on the 20th of May 1799. His father, Bernard François, never called himself de Balzac and Honoré only assumed the particle after 1830. But the father had equally little right to the name of Balzac at all, for his birth-certificate has been discovered. The true name was "Balsza," and this in various forms ("Balsa," "Balsas") has been traced for more than a century before the novelist's birth as that of a family of day-labourers or very small peasant proprietors in the parish of Canezac, department of the Tarn. It is probable that the novelist

himself was not aware of this, and his father appears to have practised some mystification as to his own professional career. In and after the Revolution, however, he actually attained positions of some importance in the commissariat and hospital departments of the army, and he married in 1797 Anne Charlotte Laure Sallambier, who was a beauty, an heiress and a woman of considerable faculty. She survived her son; the father died in 1829. There were two sisters (the elder, Laure, afterwards Madame Surville, was her brother's favourite and later his biographer), and a younger brother, Henri, of whom we hear little and that little not very favourable.

Honoré was put out to nurse till he was four years old, and in 1806, when he was seven, was sent to the *collège* (grammar school) of Vendôme, where he remained till April 1813 as a strict boarder without any holidays. From this he passed as a day-boy to the *Collège* of Tours. His father's official work was transferred to Paris the year after, and Balzac came under the teaching of a royalist private schoolmaster, M. Lepitre, and others. He left school altogether in 1816, being then between seventeen and eighteen. His experiences at Vendôme served as base for much of *Louis Lambert*, and he seems to have been frequently in disgrace. Later, his teachers appear to have found him remarkable neither for good nor for evil. He was indeed never a scholar; but he must have read a good deal, and as he certainly had no time for it later, much of this reading must have been done early.

The profession which Balzac's father chose for him was the law; and he not only passed through the schools thereof, and duly obtained his *licence*, but had three years' practical experience in the offices of a notary and a solicitor (*avoué*), for the latter of whom, M. Guillonnet-Merville, he seems to have had a sincere respect. But though no man of letters has ever had, in some ways, such a fancy for business, no man of business could ever come out of such a born man of letters. And when in 1820 (the *licence* having been obtained and M. Balzac, senior, having had some losses) the father wished the son to become a practising lawyer in one or another branch, Honoré revolted. His family had left Paris, and they tried to starve him into submission by establishing him in a garret with a very small allowance. Here he began to write tragedies, corresponded (in letters which have fortunately been preserved) with his sister Laure, and, most important of all, attempted something in prose fiction. The tragedy *Cromwell* was actually completed and read to friends if not to others; nay more, the manuscript exists in the hands of M. Spoelberch de Lovenjoul, the great authority on Balzac's life and bibliography; but it has never been published.¹ The novels, *Cocqsigne* and *Stella*, proved abortions, but were only the first of many attempts at his true way until he found it. Drama he never abandoned; but for him it was always an error.

The garret-period from 1820 to 1822 was succeeded by another of equal length at home, but before it had finished (1821) he found his way into print with the first of the singular productions which (and that not entirely or finally) have taken a sort of outside place in his works under the title of *Oeuvres de jeunesse*. The *incunabula* of Balzac were *Les Deux Hector, ou Les Deux Familles bretonnes*, and *Charles Pointel, ou Mon Cousin de la main gauche*. They were followed next year by six others:—*L'Héritière de Birague*; *Jean Louis, ou La Fille trouvée*; *Clotilde de Lusignan, ou Le Beau Juif*; *Le Centenaire, ou Les Deux Beringheld*; *Le Vicaire des Ardennes*; *Le Tartare, ou Le Retour de l'exilé*. And these were again followed up in 1823 by three more: *La Dernière Fée, ou La Nouvelle Lampe merveilleuse*; *Michel et Christine et la suite*; *L'Anonyme, ou Ni père ni mère*. In 1824 came *Annette et le criminel*, a continuation of the *Vicaire*; in 1825, *Wann-Chlore*, which afterwards took the less extravagant title of *Jane la pâle*. These novels, which filled some two score volumes originally, were published under divers pseudonyms ("Lord R'hoone," an anagram of "Honoré," "Horace de Saint Aubin" etc.), and in actual collaboration with two or three other writers. But though there is not yet in them anything more than the faintest dawn of

the true Balzac, though no one of them is good as a whole, and very few parts deserve that word except with much qualification, they deserve far more study than they have usually received, and it is difficult to apprehend the true Balzac until they have been studied. They ceased for a time, not because of the author's conviction of their badness (though he entertained no serious delusions on this subject), nor because they failed of a certain success in actual money return, but because he had taken to the earliest, the most prolonged, and the most disastrous of his dabbings in business—this time as a publisher to some extent and still more as a printer and type-founder. Not very much was known about his experiences in this way (except their general failure, and the result in hampering him with a load of debt directly for some ten years and indirectly for the whole of his life) till in 1903 MM. Hanotaux and Vicaire published the results of their inquiries into the actual accounts of the concern. There seems to have been no reason why it should not have succeeded, and there has been claimed for it first, that it provided Balzac with a great amount of actual detail which he utilized directly in the novels, and secondly, that it gave him at whatever cost a still more valuable experience of practical life—the experience which has so often been wanting to men of letters. Anyhow, from 1825 to 1828, the future author of the *Comédie humaine* was a publisher, printer and type-founder; and in the last year he had to abscond, or something like it, under pressure of debts which were never fully settled till 1838, and then by a further obligation of ninety thousand francs, chiefly furnished by his mother and never repaid to her.

It was Balzac's habit throughout his life to relieve the double pressure of debt and of work by frequent excursions into the country and abroad. On this occasion he fled to Brittany with an introduction to a M. and Mme. de Pommereul, who received him hospitably in their château near Fougères. Here he obtained some of the direct material, and most of the scenery and atmosphere, for what he himself recognized as his first serious attempt in novel-writing, *Les Chouans*, or, as it was at first called, *Le Dernier Chouan*. This book (obviously written in direct following of Scott, of whom Balzac was a lifelong admirer) has been very variously judged—those who lay most stress on his realism thinking little of it, while those who maintain that he was always a romantic "with a difference" place it higher. It has at any rate brilliant colouring, some very vivid scenes, and almost more passion as well as "curtain" at its ending than any other of his books. Though not without a touch of melodrama it differs utterly from the confused and tedious imitations of Mrs. Radcliffe, M. G. Lewis and C. R. Maturin which fill most of the *Oeuvres de jeunesse*. At the same time Balzac was engaged on a very different work, the analytic-satirical sketches which compose the *Physiologie du mariage*, and which illustrate his other and non-romantic side, again with some crudity, but again also with a vast advance on his earlier productions. Both were published in the year 1829, from which his real literary career unquestionably starts. It had exactly twenty-one years to run.

The history of these twenty-one years, though (in consequence mainly of the diligence and luck as a collector of the above-named M. de Lovenjoul) the materials for it are large and constantly accumulating, has never been arranged in a really standard biography, and there seems to be an increasing habit of concentrating the attention on parts of it. It divides itself under three heads mainly, the history of Balzac's business affairs, that of his loves and friendships and that of his actual work. The first has some small resemblance to Scott's similar experiences, though in Balzac's case there was no great crash but a lifelong pressure; on the other hand, his debts were brought upon him by a long course not so much of extravagance in actual expenditure (though there was something of this) as of financial irregularities of almost every description,—anticipations of earnings, costly methods of production (he practically wrote his novels on a succession of printed revises), speculations, travel, and lastly the collection of curiosities. As regards the second, although his fashion of life made him by terms a hermit and a vagrant, he was on good terms with most of the famous men of letters of his day from Hugo

¹Since this article was written for the 11th edition of the *Encyclopædia Britannica* a facsimile edition of *Cromwell* has been published, with introduction etc. by W. S. Hastings (Princeton, 1925).

downwards, and seems never to have quarrelled with any man, except with some of his editors and publishers, by his own fault. Balzac was indeed, in no belittling sense of the word, one of the most good-natured of men of genius. But his friendships with the other sex are of much more importance, and not in the least matters of mere gossip. His sister Laure, as has been said, and a school-friend of hers, Mme. Zulma Carraud, played important and not questionable parts as his correspondents. But at least three ladies, all of a rank higher than his own, figure as his "Egerias" to such an extent that it is hardly extravagant to say that Balzac would not have been Balzac without them. These are Madame de Berny, a lady connected with the court of the *ancien régime*, much older than himself and the mother of nine children, to whom he was introduced in 1821, who became to him *La dilecta*, who was the original of Mme. de Mortsau in *Le Lys dans la vallée*, and who seems to have exercised an excellent influence on him in matters of taste till her death in 1836; the marquise de Castries, who took him up for a time and dropped him, and who has been supposed to have been his model for his less impeccable ladies of fashion; and lastly, the Polish-Russian countess Evelina Hanska, who after addressing, as *l'Étrangère*, a letter to him as early as 1832, became his idol, rarely seen but constantly corresponded with, for the last eighteen years, and his wife for the last few months of his life. Some of his letters to her have long been known, but the bulk of them constituted the greatest recent addition to our knowledge of him as given in the two volumes of *Lettres à l'étrangère*. Of hers we have practically none and it is exceedingly hard to form any clear idea of her, but his devotion is absolutely beyond question.

Business, friendship and love, not to speak of other things, were in Balzac's case always connected with and on the whole quite secondary to work. He would even sometimes resist the commands by which at long intervals Mme. Hanska would summon him to see her, and abstract the greater part of his actual visits to her in order to serve this still more absorbing mistress. He had, as we have seen, worked pretty hard, even before 1829, and his work had partly taken forms not yet mentioned—political pamphlets and miscellaneous articles which are now accessible in the *Édition définitive* of his works, and hardly one of which is irrelevant to a just conception of him. Nor did he by any means abandon these by-works after 1829; indeed, he at one time started and almost entirely wrote, a periodical called the *Revue parisienne*. He wrote some dramas and planned many more, though the few which reached the stage left it again promptly. Balzac's dramas, as they appear in his works, consist of *Vautrin*, *Les Ressources de Quinola*, *Paméla Giraud* (arranged for the stage by others), *La Marâtre* and *Mercadet le faiseur*, the last of which has, since his death, been not unsuccessful. But on the whole he did devote himself to his true vocation, with a furious energy beside which even Scott's, except in his sadder and later days, becomes leisurely. Balzac generally wrote (dining early and lightly, and sleeping for some hours immediately after dinner) from midnight till any hour in the following day—stretches of sixteen hours being not unknown, and the process being often continued for days and weeks. Besides his habit of correcting a small printed original into a long novel on the proofs, he was always altering and re-shaping his work, even before, in 1842, he carried out the idea of building it all into one huge structure—the *Comédie humaine* with its subdivisions of *Scènes de la vie parisienne*, *Études philosophiques*, etc. Much pains have been spent upon this title and Balzac's intentions in selecting it. But the "Human Comedy," as a description for mere studies of life such as his, will explain itself at once or else can never be explained.

Of its constituents, however, some account must be given, and this can be best done through an exact and complete list of the whole work by years, with such abbreviated notes on the chief constituents as may lead up to a general critical summary. Of the two capital works of 1829, we have spoken. 1830, the epoch year, saw part (it was not fully published till the next) of *La Peau de chagrin*, one of the crudest, but according to some estimates, one of the greatest of the works, full of romantic extravagance and surplusage, but with an engrossing central idea—the Nemesis of

accomplished desire—powerfully worked out; *La Maison du chat qui pelote*, a triumph of observation and nature, together with a crowd of things less in bulk but sometimes of the first excellence—*El Verdugo*, *Étude de femme*, *La Paix du ménage*, *Le Bal de sceaux*, *La Vendetta*, *Gobseck*, *Une Double Famille*, *Les Deux Rêves*, *Adieu*, *L'Élixir de longue vie*, *Sarrazine*, *Une Passion dans le désert* and *Un Épisode sous la Terreur*. In 1831, *La Peau de chagrin* appeared complete, accompanied by *Le Réquisitionnaire*, *Les Proscrits*, *Le Chef-d'œuvre inconnu* (a masterpiece fortunately not unrecognized), *Jésus Christ en Flandre* and *Maître Cornélius*. 1832 gave *Madame Firmiani*, *Le Message*, *Le Colonel Chabert* and *Le Curé de Tours* (two stories of contrasted but extraordinary excellence), *La Bourse*, *La Femme abandonnée*, *Louis Lambert* (autobiographical and philosophic), *La Grenadière* and *Les Marana* (a great favourite with the author). In 1833 appeared *Ferragus chef des dévorants*, the first part of *L'Histoire des treize* (a collection in the more extravagant romantic manner, very popular at the time, and since a favourite with some, but few, good judges), *Le Médecin de campagne* (another pet of the author's, and a kind of intended document of his ability to support the cause of virtue, but, despite certain great things, especially a wonderful popular "legend of Napoleon," a little heavy as a whole), the universally admitted masterpiece of *Eugénie Grandet*, and *L'Illustre Gaudissart* (very amusing). 1833 also saw the beginning of a remarkable and never finished work—out of his usual scope but exceedingly powerful in parts—the *Contes drolatiques*, a series of tales of Old France in Old (or at least Rabelaisian) French, which were to have been a hundred in number but never got beyond the third batch of ten. They often borrow the licence of their 15th and 16th century models; but in *La Succube* and others there is undoubted genius and not a little art. 1834 continued the *Treize* with *La Duchesse de Langeais* and added *La Recherche de l'absolu* (one of Balzac's great studies of monomania, and thought by some to be the greatest, though others prefer *Le Chef-d'œuvre inconnu*), *La Femme de trente ans* (the chief example of the author's caprice for re-handling, and very differently judged as a whole), with yet another of the acknowledged triumphs, *Le Père Goriot*. On the whole, this year's work, though not the author's largest, is perhaps his most unique. Next year (1835) followed *Melmoth réconcilié* (a tribute to the great influence which Maturin exercised, not over Balzac only, at this time in France), *Un Drame au bord de la mer*, the brilliant, if questionable, conclusion of *Les Treize*, *La Fille aux yeux d'or*, *Le Contrat de mariage* and *Séraphita*. This last, a Swedenborgian rhapsody of great beauty in parts, has divided critics almost more than anything else of its writer's, some seeing in it (with excuse) nothing but the short description given above in three words, the others (with justice) reckoning it his greatest triumph of style and his nearest attempt to reach poetry through prose. 1836 furnished *La Messe de l'athée*, *Interdiction*, *Facino Cane*, *Le Lys dans la vallée* (already referred to and of a somewhat sickly sweetness), *L'Enfant maudit*, *La Vieille Fille* and *Le Secret des Ruggieri* (connected with the earlier *Les deux Rêves* under the general title, *Sur Cathérine de Médicis*, and said to have been turned out by Balzac in a single night, which is hardly possible). In 1837 were published *Les Deux Poètes*, destined to form part of *Illusions perdues*, *Les Employés*, *Gambara* and another capital work, *Histoire de la grandeur et de la décadence de César Birotteau*, where Balzac's own unlucky experiences in trade are made thoroughly matter of art. 1838 was less fruitful, contributing only *Le Cabinet des antiques*, which had made an earlier partial appearance, *La Maison Nucingen* and *Une Fille d'Eve*. But 1839 made amends with the second part of *Illusions perdues*, *Un Grand Homme de province à Paris* (one of Balzac's minor diplomatic pieces), *Le Curé de village* (a very considerable thing), and two smaller stories, *Les Secrets de la princesse de Cadignan* and *Masimilla Doni*. *Pierrette*, *Z. Marcas*, *Un Prince de la Bohême* and *Pierre Grassou* followed in 1840, and in 1841 *Une Ténébreuse Affaire* (one of his most remarkable workings-up of the minor facts of actual history), *Le Martyr Calviniste* (the conclusion of *Sur Cathérine de Médicis*), *Ursule Mirouet* (an admirable story), *La Fausse Maîtresse* and *Mémoires de deux jeunes ma-*

riées, on which again there have been very different opinions. 1842 supplied *Albert Savarus* (autobiographical largely), *Un Début dans la vie*, the very variously named and often rehandled *Rabouilleuse* (which, since Taine's exaltation of it, has often been taken as a Balzacian quintessence), and *Autre étude de femme*, yet another rehandling of earlier work. In 1843 came the introduction of the completed *Sur Catherine de Médicis*, *Honorine* and *La Muse du Département* (almost as often reconstructed as *La Femme de trente ans*), with *Comment aiment les jeunes filles* (a similar rehandling intended to start the collected *Splendeurs et misères des courtisanes*), and a further instalment of *Illusions perdues*, *Les Souffrances d'un inventeur*. Three out of the next four years were astonishingly fruitful. 1844 gave *Modeste Mignon* (a book with a place to itself, and said to be founded on a story actually written by Madame Hanska), *Gaudissart II.*, *A combien l'amour revient aux vieillards* (a second part of the *Splendeurs*), *Béatrix* (one of the most powerful if not of the most agreeable), and the first and very promising part of *Les Paysans*. Only *Un Homme d'affaires* came out in 1845, but this was made up in 1846 by *Les Comédiens sans le savoir* (sketched earlier), another part of the *Splendeurs*, *Où mènent les mauvais chemins*, the first part of *Les Parents pauvres*, *La Cousine Bette* (sometimes considered the topmost achievement of Balzac's genius), and the final form of a work first issued fifteen years earlier and often retouched, *Petites misères de la vie conjugale*. 1847 was even richer, with *Le Cousin Pons* (the second part of *Les Parents pauvres*, and again a masterpiece), the conclusion of the *Splendeurs*, *La Dernière Incarnation de Vautrin*, *L'Envers de l'histoire contemporaine* (which had been on and off the stocks for five years), and the unfinished *Député d'Arcis*. This was the last scene of the comedy that appeared in the life of its author. The conclusion of the *Député d'Arcis*, published in 1853, and those of *Les Paysans* and *Les Petits Bourgeois* which appeared, the first in this year, the second wholly in 1855, are believed or known to be by Balzac's friend, Charles Rabou (1803-1871).

This immense and varied total stands to its author in a somewhat different relation from that of any other work to any other writer. It has been well said that the whole of Balzac's production was always in his head together; and this is the main justification for his syllabus of it as the "Comedy." Some part never came out of his head into print; we have numerous titles of work (sometimes spoken of in his letters as more or less finished) of which no trace remains, or only fragmentary ms. sketches. One apparently considerable book, *La Bataille*, which was to be devoted to the battle of Essling, and for which he actually visited the ground, is frequently referred to as in progress from the time of his early letters to Madame Hanska onwards; but it has never been found. Another result of this relation was the constant altering, re-shaping, re-connecting of the different parts. That if Balzac had lived as long as Hugo, and had preserved his faculties as well, he could never have finished the *Comédie*, is of course obvious: the life of Methuselah, with the powers of Shakespeare, would not suffice for that. But that he never *would*—even if by some impossibility he *could*—is almost equally certain. Whether there is any mark of decline in his latest work has been disputed, but there could hardly have been farther advance, and the character of the whole, not easy to define, is much less hard to comprehend, if prejudice be kept out of the way. That character was put early, but finally, by Victor Hugo in his funeral discourse on Balzac, whose work he declared, with unusual terseness, among other phrases of more or less gorgeous rhetoric, to be "observation and imagination." It may be doubted whether all the volumes written on Balzac (a reasoned catalogue of the best of which will be found below) have ever said more than these three words, or have ever said it more truly if the due stress be laid upon the "and." On the other side, most of the mistakes about him have arisen from laying undue stress on one of the two qualities, or from considering them separately rather than as inextricably mixed and blended. It is this blending which gives him his unique position. He is an observer of the most exact, the most minute, the most elaborate; but he suffuses this observation with so strange and constant an imaginative quality that he is, to some

careful and experienced critics, never quite "real"—or almost always something more than real. He seems accustomed to create in a fashion which is not so much of the actual world as of some other, possible but not actual—no matter whether he deals with money or with love, with Paris or with the provinces, with old times or with new. A further puzzle has arisen from the fact that though Balzac has virtuous characters, he sees humanity on the whole "in black"; and that, whether he actually prefers the delineation of vice, misfortune, failure, or not, he produces as a rule in his readers the sensation familiarly described as "uncomfortable." His morality has been fiercely attacked and valiantly defended, but it is absolutely certain that he wrote with no immoral intention, and with no indifference to morality. In the same way there has been much discussion of his style, which seldom achieves beauty, and sometimes falls short of correctness, but which still more seldom lacks force and adequacy to his own purpose. On the whole, to write with the shorthand necessary here, it is idle to claim for Balzac an absolute supremacy in the novel, while it may be questioned whether any single book of his, or any scene of a book, or even any single character or situation, is among the very greatest books, scenes, characters, situations in literature. But no novelist has created on the same scale, with the same range; none has such a cosmos of his own, pervaded with such a sense of the originality and power of its creator.

Balzac's life during these twenty years of strenuous production has, as regards the production itself, been already outlined, but its outward events, its distractions or avocations—apart from that almost weekly process of "raising the wind," of settling old debts by contracting new ones, which seems to have taken up no small part of it—must now be shortly dealt with. Besides constant visits to the Margonne family at Saché in Touraine, and to the Carrauds at Frapesle in Berry, he travelled frequently in France. He went in 1833 to Neuchâtel for his first meeting with Madame Hanska, to Geneva later for his second, and to Vienna in 1835 for his third. He took at least two flights to Italy, in more or less curious circumstances. In 1838, he went on a journey to Sardinia to make his fortune by melting the silver out of the slag-heaps of Roman mines—a project, it seems, actually feasible and actually accomplished, but in which he was anticipated. The year before, tired of Paris apartments, he had bought ground at Ville d'Avray, and there constructed, certainly at great, though perhaps exaggerated expense, his villa of Les Jardies, which figures largely in the Balzacian legend. His rash and complicated literary engagements, and (it must be added) his disregard of them when the whim took him, brought him into frequent legal difficulties, the most serious of which was a law-suit with the *Revue de Paris* in 1836. In 1831, and again in 1834, he had thought of standing for election as Deputy, and in the latter year he actually did so both at Cambrai and Angoulême; but it is not certain that he received any votes. He also more than once took steps to become a candidate for the Academy, but retired on several occasions before the voting, and when at last, in 1849, he actually stood, he only obtained two votes.

As early as the Genevan meeting of 1833, Madame Hanska had formally promised to marry Balzac in the case of her husband's death, and this occurred at the end of 1841. She would not, however, allow him even to visit her till the next year had expired, and then, though he travelled to St. Petersburg and the engagement was renewed after a fashion, its fulfilment was indefinitely postponed. For some years Balzac met his beloved at Baden, Wiesbaden, Brussels, Paris, Rome and elsewhere. Only in September 1847 was he invited on the definite footing of her future husband to her estate of Wierzchownia in the Ukraine; and even then the visit, interrupted by one excursion to Paris and back, was prolonged for more than two years before (on the 14th of March 1850) the wedding actually took place. But Balzac's own *Peau de chagrin* was now reduced to its last morsel. His health, weakened by his enormous labours, had been ruined by the Russian cold and his journeyings across Europe. The pair reached the house at Paris in the rue Fortunée, which Balzac had bought for his wife and filled with his collections, at the end of May. On Sunday, the 17th of August, Victor Hugo found Balzac dying,

attended by his mother, but not by his wife. He actually died at half-past eleven that night and was buried on the 20th, the pallbearers being Hugo himself, Dumas, Sainte-Beuve (an enemy, but in this case a generous one) and the statesman Baroche, in Père Lachaise, where Hugo delivered the speech cited above.

BIBLIOGRAPHY.—The extraordinarily complicated bibliography of Balzac will be found all but complete in the *Histoire des œuvres* (1875 and later), attached by M. Spoelberch de Lovenjoul to the *Édition définitive*, and supplemented by him in numerous smaller works, *Autour de Balzac*, *Une Page perdue de Balzac*, etc. Summaries of it will be found appended to the introductory critical notices of each volume of the English translation edited by Saintsbury (London, 1895–1898), which also contains a short Memoir and general criticism. Before the *Édition définitive* (1869 onwards), the works had been issued during the author's life in various forms and instalments, the earliest *Comédie humaine* being of 1842 to 1846 in sixteen volumes. For many years, however, the edition best known was that referred to in Browning as "all Balzac's novels fifty volumes long," really fifty-five small and closely printed 24mos. kept stereotyped with varying dates by Michel (Calmann) Lévy, which did not contain the miscellaneous works and was not arranged according to the author's last disposition, but did include the *Oeuvres de jeunesse*. These were not reprinted in the *Édition définitive*, but this gives the miscellaneous works in four volumes, an invaluable volume of correspondence, and the *Histoire des œuvres* as cited. To this was added, in 1893, another volume, *Répertoire des œuvres de Balzac*, in which the history of the various personages of the *Comédie* is tracked throughout and ranged under separate articles by MM. Cerfbeer and Christophe with extraordinary pains, and with a result of usefulness which should have protected it from some critical sneers. In 1899 appeared, as the first volume of *Oeuvres posthumes* an instalment of the *Lettres à l'étrangère*, and in 1906 a second (up to 1844) with a portrait of Madame Hanska, and other illustrations.

Works on Balzac are very numerous, and some of them are of much importance. Sainte-Beuve and Balzac fell out, and a furious diatribe by the novelist on the critic is preserved; but the latter's postmortem examination in *Causeries du lundi*, vol. II, is not unfair though it could hardly be cordial. Gautier, who was a very intimate and trusty friend of Balzac, has left an excellent study, mainly personal, reprinted in his *Portraits contemporains*. Lamartine produced a volume, not of much value, on Balzac in 1866; and minor contemporaries—Gozlan, Lemer, Champfleury—supplied something. But the series of important studies of Balzac, based on the whole of his work and not biased by friendship or enmity, begins with Taine's *Essay* of 1858, reprinted in volume form, 1865. Even then the *Oeuvres diverses* were accessible only by immense labour in the scattered originals, and the invaluable *Correspondance* not at all. It was not till the reunion of all in the *Édition définitive* was completed, that full study of man and work was possible. To this edition itself was attached a sort of official critical introduction, *L'Oeuvre de Balzac*, by M. Marcel Barrière (1890). But this is largely occupied by elaborate analyses of the different books, and the purely critical part is small, and not of the first value. Better are M. Paul Flat's *Essais sur Balzac* (2 vols., 1893–1894), which busy themselves especially with tracing types of character. Important and new biographical details (including the proper spelling of the name) were given in M. Edmond Biré's *Honoré de Balzac* (1897). The *Balzac ignoré* of A. Cabanes (1899) is chiefly remarkable for its investigations of Balzac's fancy for occult studies, and the first part (*Balzac imprimeur*) of MM. Hanotaux and Vicaire's *La Jeunesse de Balzac* (1903, new ed., 1921) mentioned above, for its dealing with the printing business and the intimacy with Madame de Berny. Two most important studies of Balzac in French, are those of M. A. Le Breton, *Balzac, l'homme et l'œuvre* (1905), a somewhat severe, but critical and very well-informed examination, and M. Ferdinand Brunetière's *Honoré de Balzac* (1906), a brilliant but rather one-sided panegyric on the subject as the evolver of the modern novel proper, and a realist and observer *par excellence*. In English, translations of separate books are innumerable; of the whole, besides that mentioned above, but containing a few things there omitted, an American version by Miss Wormeley and others may be mentioned. The most elaborate monograph in English, till recently, was F. Wedmore's *Balzac* (1887), with a useful bibliography up to the time. The recent additions to our knowledge are utilized in Miss Mary F. Sanders' *Balzac* (1904), a rather popular, but full and readable summary, chiefly of the life, from all but the latest documents, and W. H. Helm's *Aspects of Balzac* (1905), which is critical as well as anecdotic. The present writer, besides the critical and biographical essays referred to above, prefixed a shorter one to a translation of *Les Chouans* executed by himself in 1890.

Of works published since the above article was written, see *Correspondance inédite de Honoré de Balzac avec le Lieut. Colonel L.-N. Periotas*, 1832–45, edit. M. Bouteron (1923); L. J. Arrignon, *Les Années romantiques de Balzac* (1927). (G. SA.)

BALZAC, JEAN LOUIS GUEZ DE (1594–1654), French author, was born at Angoulême. At the age of 18 he travelled in Holland with Théophile de Viaud, with whom he later ex-

changed bitter recriminations. He was early befriended by the duc d'Épernon and his son Louis, cardinal de la Valette, who took him to Rome. His letters written to his acquaintances, and to many who held high positions at the French court, gained for him a great reputation. Compliments were showered upon him, and he became an habitué of the Hôtel de Rambouillet. Richelieu was lavish of praise and promises, but never offered Balzac the preferment he expected. In 1624 a collection of his *Lettres* was published, and was received with great favour. From the château of Balzac, whither he had retired, he continued to correspond with Jean Chapelain, Valentin Conrart, and others. In 1634 he was elected to the Academy. His fame rests chiefly upon the *Lettres*, a second collection of which appeared in 1636. *Recueil de nouvelles lettres* was printed in the next year. His letters, though empty and affected in matter, show a real mastery of style, introducing a new clearness and precision into French prose and encouraging the development of the language on national lines by emphasizing its most idiomatic elements. Balzac has thus the credit of executing in French prose a reform parallel to Malherbe's in verse. In 1631 he published a eulogy of Louis XIII. entitled *Le Prince*; in 1652 the *Socrate chrétien*, the best of his longer works; *Aristippe ou de la Cour* in 1658; and several dissertations on style.

His *Oeuvres* were collected in 1665 by Valentin Conrart. There are numerous English translations from Balzac, dating from the 17th century.

BAM, a town of Persia in the province of Kerman, situated about 120m. south-east of Kerman on the western edge of the great salt desert, Dasht-i-Lut, at an elevation of 3,600ft. Population c. 8,500. The modern town, which may be described as an agglomeration of houses and extensive gardens and date-groves with post and telegraph offices, stands on both banks of the river Bam, and is unfortified. In the middle ages the great trade routes from Tiz, Siraf and Hormuz converged at Bam, where the caravans rested before they attempted the passage of the desert tract which intervened before they could reach the fertile lands of the Helmund. Outside the town stands the famous fortified citadel which owed its strength to the Afghans who took Bam in 1719 and were not finally expelled until 1801. Almost all the henna used in Persia is grown in this district.

See also BALUCHISTAN (Persian).

BAMBERG, a town and archiepiscopal see of Germany, in the free State of Bavaria. Pop. (1925) 50,158. It lies on an open plain on the river Regnitz, 2m. above its junction with the Main, and 39m. north of Nürnberg. Bamberg, first mentioned in 902, grew up by the castle (Babenberch) which gave its name to the Babenberg family (q.v.). On their extinction it passed to the Saxon house, and in 1007 the emperor Henry II. founded the see. From the middle of the 13th century onward the bishops were princes of the empire. The see was secularized in 1802 and in 1803 assigned to Bavaria. The cathedral, a late Romanesque building with four imposing towers, founded in 1004 by the emperor Henry II., was later partially burnt, and rebuilt in the 13th century. It contains the magnificent marble tomb of the founder and his wife, the empress Cunigunde, the work of Riemenschneider (c. 1500). Other noteworthy churches are the Jakobskirche, an 11th-century Romanesque basilica; St. Martinskirche; and Marienkirche (1320–87). The Michaelskirche, 12th-century Romanesque (restored) on the Michaelsberg, was formerly the church of a Benedictine monastery secularized in 1803. The most interesting bridge leading to the lower town is the *Obere Brücke* (1455), in the middle of which, on an artificial island, is the Rathaus (rebuilt 1744–56). The picturesque Old Palace (*Alte Residenz*) was built in 1591 on the site of an old residence of the counts of Babenberg. The New Palace (1698–1704) was formerly occupied by the prince-bishops. The schools include the lyceum for philosophy and Catholic theology (a survival of the university suppressed in 1803), which had 70 students in 1925. The industries of the town include cotton spinning and weaving, silk spinning, the manufacture of shoes, calico and ropes. The market gardens of the neighbourhood are famous, and there is a considerable shipping trade by the river and the Ludwigskanal.

BAMBERGER, LUDWIG (1823-1899), German economist and politician, was born of Jewish parents at Mainz. After studying at Giessen, Heidelberg, and Göttingen, he entered on the practice of the law. When the revolution of 1848 broke out he took an active part as one of the leaders of the republican party in his native city, both as popular orator and as editor of one of the local papers. In 1849 he took part in the republican rising in the Palatinate and Baden; he was condemned to death, but escaped to Switzerland. The next years he spent in exile, at first in London, then in Holland; in 1852 he went to Paris, where he entered the bank of Bischoffheim and Goldschmidt, of which he became managing director, a post which he held till 1866, when the amnesty enabled him to return to Germany. He was elected a member of the Reichstag, where he joined the National Liberal party. In 1870, owing to his intimate acquaintance with France and with finance, he was summoned by Bismarck to Versailles to help in the discussion of terms of peace. In the German Reichstag he was the leading authority on matters of finance and economics, as well as a clear and persuasive speaker, and it was chiefly owing to him that a gold currency was adopted and that the German Imperial Bank was constituted; in his later years he wrote and spoke strongly against bimetalism. He was a free trader, and after 1878 refused to follow Bismarck in his new policy of protection, state socialism, and colonial development; in a celebrated speech he declared that the day on which it was introduced was a *dies nefastus* for Germany. He and a number of followers left the National Liberal party and formed the so-called "Secession" in 1880. He was one of the few prominent politicians who consistently maintained the struggle against state socialism on the one hand and democratic socialism on the other. In 1892 he retired from political life. Bamberger's most important works are those on the currency, on the French war-indemnity, his criticism of socialism and his apology for the Secession.

An edition of his collected works (including a French life of Bismarck in French, written as propaganda) was published in 1894. After his death appeared a volume of reminiscences, *Erinnerungen*, ed. P. Nathan (1899), which, though it does not extend beyond 1866, gives an interesting picture of his share in the revolution of 1848, and of his life in Paris. See also L. Hartwig, *Ludwig Bamberger, Eine biographische Skizze* (1900).

BAMBINO, IL (Ital. for "the Babe"), the name given in art to the image of the infant Jesus in swaddling clothes common in Roman Catholic churches.

BAMBOO, the popular name for members of the *Bambuseae*, a tribe of the grass-family (*Gramineae*). They are large, often tree-like, with woody stems. The stems spring from an underground root-stock and are often crowded to form dense clumps; the largest species reach 120ft. in height. The slender stem is hollow, and, as generally in grasses, has well-marked joints or nodes, at which the cavity is closed by a strong diaphragm. The branches are numerous and in some species spiny; the narrow, often short, leaf-blade is usually jointed at the base and has a short stalk, by which it is attached to the long sheath. The spikelets are usually many-flowered and variously arranged in racemes or panicles. The flower differs from that of the majority of grasses in having usually three lodicules and six stamens. Many species bloom annually, but others only at intervals sometimes of many years, when the individuals of one and the same species are found in bloom over large areas. Thus on the west coast of India the simultaneous blooming of *Bambusa arundinacea*, one of the largest species, has been observed at intervals of 32 years. After ripening of the seed, the leafless flowering culms always die down. The bamboo appears to be the most rapid growing of the higher plants. *Dendrocalamus giganteus* has been observed to grow 16in. in a day in Ceylon.

The *Bambuseae* contain numerous genera and occur throughout the tropical zone, but very unevenly distributed; they also extend into the sub-tropical and even into the temperate zone. Tropical Asia is richest in species; in Africa there are very few. In Asia they extend into Japan and to 10,000ft. or more on the Himalayas; and in the Andes of South America they reach the snow-line.

The fruit in *Bambusa*, *Arundinaria*, and other genera resembles the grain generally characteristic of grasses, but in *Dendrocalamus* and others it is a nut, while rarely, as in *Melocanna*, it is fleshy and suggests an apple in size and appearance. The uses to which all the parts and products of the bamboo are applied in Oriental countries are almost endless. The soft and succulent shoots, when just beginning to spring, are cut off and served up at table like asparagus. Like that vegetable, also, they are earthed over

FROM GAMBLE, "THE BAMBUSEAE OF BRITISH INDIA"

FIG 1—AN INDIAN BAMBOO, (*BAMBUSA, ARUNDINACEA*)
Narrow leaves and branch with inflorescence, parts of which are detailed in small figures

to keep them longer fit for consumption; and they afford a continuous supply during the whole year, though it is more abundant in autumn. They are also salted and eaten with rice, prepared in the form of pickles or candied and preserved in sugar. As the plant grows older, a species of fluid is secreted in the hollow joints, in which a concrete substance once highly valued in the East for its medicinal qualities, called *tabashir* or bamboo manna, is gradually developed. This substance, which is a purely siliceous concretion, is possessed of peculiar optical properties.

The grains of the bamboo are also used as food by the Chinese, and the Hindus eat it mixed with honey as a delicacy. It is, however, the stem of the bamboo which is applied to the greatest variety of uses. Joints of sufficient size form water buckets; smaller ones are used as bottles, and among the Dyaks of Borneo they are employed as cooking vessels. Bamboo is extensively used as a timber wood, and houses are frequently made entirely out of the products of the plant; complete sections of the stem form posts or columns; split up, it serves for floors or rafters; and, interwoven in lattice-work, it is employed for the sides of rooms, admitting light and air. The roof is sometimes of bamboo solely, and when split, which is accomplished with the greatest ease, it can be formed into laths or planks. It is employed in shipping of all kinds; some of the strongest plants are selected for masts of boats of moderate size, and the masts of larger vessels are sometimes formed by several joined bamboos.

The bamboo is employed in the construction of all kinds of agricultural and domestic implements and in the materials and implements required in fishery. Bows are made of it by the union of two pieces with many bands; and, the septa being bored out and the lengths joined together, it is employed in transmitting water to reservoirs or gardens. A joint forms a holder for papers or pens, and it was in a joint of bamboo that silk-worm eggs were carried from China to Constantinople during the reign of Justinian. The outer cuticle of Oriental species is so hard that it forms a sharp and durable cutting edge, and it is so siliceous that it can be used as a whetstone. This outer cuticle, cut into thin strips, is one of the most durable and beautiful materials for basket-making, and both in China and Japan it is largely so employed. Strips are also woven into cages, chairs, beds, and other articles of furniture, Oriental wickerwork in bamboo being unequalled for beauty and neatness of workmanship. In China, the interior portions of the stem are beaten into a pulp and used for the manufacture of the finer varieties of paper. Bamboos are imported to a considerable extent into Europe for the use of basket-makers, and for umbrella and walking-sticks. In short, the purposes to which the bamboo is applicable are almost endless, and well justify that "it is one of the most wonderful and most beautiful productions of the tropics, and one of Nature's most valuable gifts to uncivilized man." (A. R. Wallace, *The Malay Archipelago*.)

A number of species of bamboo are hardy under cultivation in the British Isles. A useful and interesting account of these and

their cultivation will be found in *The Bamboo Garden*, by A. B. Freeman-Mitford. They are mostly natives of China and Japan and belong to the genera *Arundinaria*, *Bambusa*, and *Phyllostachys*, but include a few Himalayan species of *Arundinaria*. They may be propagated by seed (though owing to the rare occurrence of fruit, this method is seldom applicable), by division, and by cuttings. They are described as hungry plants which well repay

THE BAMBOO, A TROPICAL GRASS OF WIDE AND VARYING USEFULNESS. BESIDES ITS EMPLOYMENT IN THE BUILDING OF HOUSES AND BRIDGES, THE STEM IS USED TO MAKE PAPER, FISHING RODS, WICKERWORK, ETC. THE YOUNG SHOOTS AND SEEDS ARE EATEN AS FOOD

Centre, Bamboo (*Bambusa vulgaris*)
Right, Detail of plant

generous treatment, and will flourish in a rich, not too stiff loam, and for the first year or two should be well mulched. They should be sheltered from winds and well watered during the growing period. When being transplanted the roots must be disturbed as little as possible.

Two species of bamboo, constituting the disappearing "canebrakes" of the Southern States, are native to the United States, and a number of others have been introduced. Because of danger from pests the introduction of living bamboos and bamboo seed from foreign countries has been forbidden since 1919, except importations made by the United States Department of Agriculture for experimental work. Bamboos thrive best in the cotton States and the west coast valleys of southern California. American uses for bamboo include fences, crates and other farm articles; raw material for commercial manufactures, including furniture, phonograph needles and various receptacles; and landscape ornamentation. Clump bamboos stand up against hurricanes much better than most other plants and trees. The shoots of the edible bamboo are being increasingly used for food, especially in spring salads.

BAMBURGH or **BAMBOROUGH**, coastal village of Northumberland, England, 5m. E. of Belford, with coastguard and lifeboat stations. Pop. of parish (1921) 734. The ancient castle, now restored, occupies a magnificent site near the sea, on a rock 150ft. high, accessible only on the south-east side. The buildings are of various dates from the Norman period; but the first erection is ascribed by the Saxon chronicles to King Ida of Northumberland. The town which grew around the castle seems to have been a royal borough from the time of the Conquest; and thereafter its fate varied with that of the castle. It suffered severely both in the internal struggles and in the Scottish wars down to the 15th century. From this time on there is no further mention

of burgesses or their privileges, which had included the grants of a gild merchant, markets and fairs. Lord Neville received licence to dig for sea-coals here in 1384, and during the later middle ages mines of coal and lead were worked in the neighbourhood. The village was the birthplace of Grace Darling (q.v.) in 1815. The Longstone Lighthouse with which her name is connected occupies an outer rock of the Farne Islands, which stretch north-east for 6m. from the coast at Bamburgh.

BAMBUTE (sometimes incorrectly called *BATWA*), a race of pygmies of the Semliki Forest, on the western borders of Uganda between Albert Nyanza and Albert Edward Nyanza. They probably form merely a branch of the pygmy race of Equatorial Africa. Their complexion varies from reddish-yellow to brownish-black, with head-hair often of a russet-brown, and body-hair, black and bristly on upper lip, chin, chest, axillae and pubes, yellowish and fleecy on cheeks, back and limbs. Their average height is 4ft. gins. Even when forced to keep clean, their skins give out a rancid odour, something (Sir H. H. Johnston says) between the smell of a monkey and a negro. Their faces are remarkable for the long upper lip, and the bridgeless nose with enormous alae (the cartilage of the nose above the nostrils). They are nomad hunters, building only huts of sticks and leaves, and living in the forest, where they hunt the largest game with no weapon but a tiny bow from which they shoot poisoned arrows. They have a good idea of drawing, and with a sharpened stick can sketch in sand or mud the beasts and birds known to them. They do not tattoo or scar and wear no ear-rings, necklets, anklets, etc. The upper incisors and canines are sharpened to a point. In the forests they go quite naked. They speak a corrupted form of the dialects of their negro neighbours. They have a peculiar way of singing their words. Their voices are low and musical and the pronunciation is singularly staccato, every syllable being separately uttered. They show no trace of spirit or ancestor worship, but have some idea that thunder, lightning and rain are manifestations of an Evil Power, and that the dead are reincarnated in the red bush-pig. They have no tribal government, accepting as temporary lawgiver some adept hunter. Marriage is by purchase; polygamy seems to exist, but the domestic affections are strong. The dead are buried in dug graves, and food, tobacco and weapons are often placed with the corpse. The Bambute are very musical, though they are uninventive as regards instruments. They have many songs which they sing well and they dance with spirit.

See A. de Quatrefages, *The Pygmies* (Eng. ed. 1895); Sir H. H. Johnston, *Uganda Protectorate* (1902).

BAMFORD, SAMUEL (1788–1872), English labour politician, was born at Miston, near Middleton, Lancashire, on Feb. 28, 1788. He was a working weaver and reformer who earned great respect in northern circles; but he was timid in policy and jealous of rivals. Through attending and speaking at the meeting (1819) at Peterloo, Manchester (q.v.), which was intended to be a peaceful gathering to petition for parliamentary reform and a repeal of the Corn laws, but ended in a massacre, he was arrested for a breach of the law and sentenced to 12 months' imprisonment. He was the author of several widely popular poems (principally in the Lancashire dialect) showing sympathy with the conditions of his class, and his *Passages in the Life of a Radical* (1840–44) is a very valuable indication of the condition of the working classes, marred sometimes by personal prejudices. He died at Harpurhey on April 13, 1872, and was accorded a public funeral, attended by thousands.

BAMIAN, a once renowned city of Afghanistan, about 80 m. N.W. of Kabul, in a valley of the Hazara country, on the chief road from Kabul towards Turkistan, and immediately at the northern foot of that prolongation of the Indian Caucasus now called Koh-i-Baba. The passes on the Kabul side are not less than 11,000 and 12,000 ft. in absolute height, and those immediately to the north but little inferior. The height of the valley was fixed at about 8,500 ft., and the surrounding country surveyed in Nov. 1885. The river draining the valley is one of the chief sources of the Sarkhab (Surkhab) or Aksarai, an important tributary of the upper Oxus. The prominences of the cliffs which line the valley

THE BAMBOO PLANT OF THE TROPICS

Bamboo, a hollow-stemmed plant, grows very rapidly, and in Ceylon, where it is native, has been known to increase sixteen inches in a day, and to attain a height of 120 feet. The plants grow in dense and almost impenetrable masses. The stems are used in the East for structural purposes as well as for many small articles of manufacture.

are crowned by the remains of numerous massive towers, whilst their precipitous faces are for 6 or 7 m. pierced by numerous ancient cave-dwellings, some still occupied. The most famous remains at Bamian are two colossal standing idols, carved in the cliffs on the north side of the valley. They are 173 ft. and 120 ft. high respectively. These images, much injured apparently by cannon-shot, are cut in niches in the rock, and both images and niches have been coated with stucco. There is an inscription, not yet interpreted, over the greater idol, and on each side of its niche are staircases leading to a chamber near the head, which shows traces of elaborate ornamentation in azure and gilding. These chambers are used by the amir as store-houses for grain. The surface of the niches also has been painted with figures. In one of the branch valleys is a similar colossus, somewhat inferior in size to the second of these two; and there are indications of other niches and idols. At Haibak there is a very perfect excavation called the Takht-i-Rustam (a general name for all incomprehensible constructions amongst the modern inhabitants of Afghan Turkistan), which consists of an annular ditch enclosing a platform, with a small house about 21 ft. square above it, all cut out of the solid rock. There are hundreds of caves in this neighbourhood, all pointing to a line of Buddhist occupation connecting Balkh with Kabul.

That the idols of Bamian, about which so many conjectures have been uttered, were Buddhist figures, is ascertained from the narrative of the Chinese pilgrim, Hsuan-Tsang, who saw them in their splendour in A.D. 630, and was verified by the officers above named, who discovered other Buddhist caves and excavations in the valleys of the Balkhab and Sarikol. Still vaster than these was a recumbent figure, 2 m. east of Bamian, representing Sakya Buddha entering *Nirvāna*, i.e., in act of death. This was "about 1,000 ft. in length." No traces of this are alluded to by modern travellers, but in all likelihood it was only formed of rubble plastered (as is the case still with such *Nirvāna* figures in Indo-China) and of no durability. For a city so notable Bamian has a very obscure history. In the time of Hsüang Tsang it was the head of one of the small states into which the empire of the White Huns had broken up. Bamian was (c. 1164–1214 A.D.) the seat of a branch of the Ghori dynasty, ruling over Tokharistan, or the basin of the upper Oxus. The place was long besieged, and finally annihilated (1222) by Jenghiz Khan, whose wrath was exasperated at the death of a favourite grandson by an arrow from its walls. In 1840, during the British occupation of Kabul, Col. William H. Dennie routed Dost Mahommed Khan, and a number of Uzbek chiefs at Bamian.

See Hon. M. G. Talbot, "The Rock-cut Caves and Statues of Bamian," *Journal R. Austral. Soc.* vol. xviii.; and J. A. Gray, *At the Court of the Amir* (1895). (G. MA.)

BAMPTON, JOHN (1690?–1751), English divine, Trinity college, Oxford, M.A. in 1712, became canon of Salisbury, and died on June 2, 1751. His will directs that eight lectures shall be delivered annually at Oxford in the university church on Sunday mornings in full term, "between the commencement of the last month in Lent term and the end of the third week in Act term." The lecturer is to be at least a master of arts of Oxford or Cambridge, chosen by the heads of colleges; no one can be chosen twice. The series began in 1780, though since 1895 elections are only made in alternate years through the depreciation of the fund. The lecturer is paid £120; and the lectures are to be printed and published within two months of their delivery. A complete list, down to and including those of 1900, is given in the *Oxford Historical Register* (1900). The lectures as a whole form a historically interesting collection of apologetic literature; some of the subjects treated have been open to criticism as being outside the terms of the trust: the arguments of some of the series have led to sharp controversies; e.g., the very first, White's in 1780, on the Muslim religion; and in more recent days Mansel's (1858) and Gore's (1891) arousing memorable contentions.

BAMPUR, a town and an ancient capital of Persian Baluchistan, in 27° 12' N., 60° 24' E., situated at an elevation of about 1,900 ft. It stands on the Bampur river which, flowing from east to west, empties itself into a depression called the Jaz Murian,

and consists of a camp of some 200 mud houses and huts rather than a town. The river valley is covered with gardens and date groves belonging to Baluchis which present a striking contrast to the barren plain of Bampur. The place is a point of some strategic importance as many roads from the coast and the interior converge here. The climate is unhealthy. The old citadel having fallen into ruins, Bampur has become less important since the construction of the fort at Fahruj or Pahura, some 16 m. to the east, in 1892. The district is the richest in Persian Baluchistan, and were the water-supply to be adequately used could support a population ten times as great.

See also BALUCHISTAN (Persian).

BAN, a word taken from the root of a verb common to many Teutonic languages and meaning originally "to proclaim" or "to announce." The Late Latin form of the word is *bannum*.

In the laws of the Franks and kindred tribes the word had three main uses: first in the general sense of a proclamation; secondly, for the fine incurred for disobeying such proclamation, and thirdly for the district over which proclamations were issued. It was the frequent use of proclamations or bans, commanding or forbidding certain actions under a threat of punishment, which caused the second of these uses to arise out of the first, as the idea of wrong-doing became associated with the proclamation or ban. This *bannum dominicum*, as it was called, was employed by all feudal lords, from the king downwards, against offenders, and played an important part in the administration of justice. It usually took the form of an order to make some amend for wrong-doing, which, if not complied with, was followed by outlawry.

After the break-up of the Carolingian empire another use of the word arose in France. "Ban" had occasionally been used for the summons calling out the host; thus it came in France to be used of the vassals summoned to the host by the king, while the sub-vassals summoned by the vassals were known as the *arrière-ban* (*retro-bannum*). The ban and *arrière-ban* were last summoned in 1758. In the mediaeval empire the word ban (Ger. *Acht*) retained the special sense of punishment.

The execution of the ban of the empire (*Reichsacht*) was usually entrusted by the emperor or German king to some prince or noble, who was often rewarded with a portion of the outlaw's lands. At first this sentence was the act of the emperor or king himself, but in later times it was entrusted to the imperial aulic council (*Reichshofrat*), and to the imperial court of justice or imperial chamber (*Reichskammergericht*). These courts were deprived of this power in 1711, retaining only the right of suggesting its use. The imperial ban had, however, been used for the last time in 1706, when Maximilian Emanuel, elector of Bavaria, was placed under it.

In France this punitive sense of the word "ban" survived in its application to the penalty of exile whether from the country or to a particular district in it; it survives in the legal designation *rupture de ban* for the escape of a criminal from the place assigned to him as a residence. From this use of the term comes the word "banish" (Fr. *bannir*, Ger. *bannen*). The word "ban" is also used in English as a synonym for excommunication (Ger. *Bann*). It has thus come to have a sense of combined exclusion and moral reprobation, as when we talk of this or that being under the ban of public opinion. In English the word survives in its original sense of a proclamation only in the "banns of marriage" (q.v.).

BAN, a title formerly used in south-eastern Europe, especially southern Hungary, to denote the governors of military districts known as *banats*. It is a Persian word meaning "lord" or "master" and was first introduced into Europe by the Avars. The last functionary to bear this title was the governor of Croatia, who was known as the ban of Croatia, Slavonia and Dalmatia. He was appointed by the king of Hungary and sat in the Hungarian house of magnates. His functions were civil. With the collapse of the Habsburg monarchy in 1918 the office and title came to an end.

BANANA, a gigantic herbaceous plant belonging to the genus *Musa* (family Musaceae). It is perennial, sending up from an underground root-stock an apparent stem up to 10 ft. high, con-

sisting of the closely-enveloped leaf-sheaths, the corresponding blades, each sometimes 10 ft. in length, forming a spreading crown. A true stem develops at the flowering period; it grows up through the hollow tube formed by the sheaths, emerges above and bears a large number of inconspicuous tubular flowers closely crowded in the axils of large, often brightly-coloured, protecting bracts. The fruits form dense clusters.

The genus *Musa* contains 30 species, widely distributed throughout the tropics of the Old World, and in some cases introduced into the New World. In many parts of the tropics they are as important to the inhabitants as are the grain plants to those living in cooler regions. They are most successfully cultivated in a hot, damp, tropical climate. The unripe fruit is rich in starch, which in ripening changes into sugar. The most generally used fruits are derived from *Musa paradisiaca*, of which an enormous number of varieties and forms exist in cultivation. The sub-species *sapientum* (formerly regarded as a distinct species *M. sapientum*) is the source of the fruit generally known in England as bananas, and eaten raw, while the name plantain is given to forms of the species itself, *M. paradisiaca*, which require cooking. The species is probably a native of India and southern Asia. Other species which

known in East Africa which attain nearly 2 ft. in length with the thickness of a man's arm. A form of *M. corniculata*, from Cockin China and the Malay Archipelago, produces only a single fruit, which, however, affords an adequate meal for three men.

No other class of tropical fruits is so widely known and only the coconut has greater economic value. The banana stands with the apple, grape, olive, orange and lemon among the leading fruits of the world. Various types of bananas are cultivated throughout

the Tropics and a few kinds are now planted outside that zone. Since 1880 banana culture has greatly expanded in the West Indies, Central America, Mexico and Colombia. The value of bananas shipped from these regions to the United States and Europe is about \$50,000,000 yearly. The domestic value of these fruits within the Tropics of both hemispheres is incalculable. (See MANILA HEMP; PLANTAIN.)

BANAS or BUNAS, the name of three rivers of India: (1) a river of Rajputana, which rises in the Aravalli range in Udaipur, drains the Udaipur valley, and after a course of 300m. flows into the Chambal; (2) a river of the Shahabad district of Bengal, which forms the drainage channel between the Arrah canal and the Sone canals system, and finally falls into the Gangi nadi; (3) a river of Chota Nagpur in Bengal, which rises in the state of Chang Bhakar and falls into the Sone near Rampur.

BANAT. This name, which means "frontier province," was given to a region south-east of the present Hungarian frontiers which was enclosed by the Danube on the south, the Maros on the north, the Theiss on the west and the Transylvanian Alps on the east. It has ceased to exist now as a unity within these boundaries since nearly a third of the original province (namely that part of it on the west between the Theiss and the city of Temesvar) has by the Peace Treaties been given to Yugoslavia. The remainder lies in Rumania.

In the ninth and tenth centuries the Banat was occupied by the invading Magyars who in the 13th century were largely displaced by the Tatar invasions. In the 14th century great bodies of Serbian refugees settled in the part of it now incorporated in Yugoslavia. They were the result of the defeat of the Serbs at the battle of Kosovopolye. These refugees were granted charters by successive kings of Hungary which had now weathered the Tatar storms. In 1552 during the great campaign of Suliman the Magnificent, the whole of the Banat fell into Turkish hands, and only in 1718 after the peace of Passarowitz did it come into the Habsburg empire. During the Turkish occupation it had fallen from being one of the most fertile provinces of Hungary into complete neglect. Count Claudius Mercy, who was its governor in 1720, commenced a scheme of reclamation which laid the basis of its subsequent prosperity. Under Maria Theresa immigrants from western Europe were encouraged and a fine body of colonists came from the Rhine provinces, from Bavaria and from Alsace. This stock remains the most prosperous and industrious element in the province and jealously retains its nationality. French and German are still the languages of the northern and north-western part of the province. In 1779 the province was incorporated with Hungary, but in 1849 it was made an Austrian Crown land. In 1860 it reverted again to Hungary. The German inhabitants are peaceable and have no particular preference either for Hungary or for Rumania. Commercially the change of suzerainty has left them unhappily placed since Budapest, which was their chief market, is no longer accessible. They now have to sell their produce to the towns of Transylvania which are not such good markets.

THE BANANA, A TROPICAL PLANT FAMOUS FOR ITS FRUIT, WAS FIRST CULTIVATED COMMERCIALY IN THE 19TH CENTURY. THE NATIVES WEAVE CLOTH FROM ITS LEAVES AND TWIST ITS FIBRE INTO ROPE

A. Banana plant showing drooping flower stem, from which upper male flowers have fallen, leaving fruits ripened from lower female flowers
B. Single female flower
C. Part of the flowering system with female flowers and small leaves growing below the seed vessel
D. Single male flower with five fertile fertilizing organs and sterile pistil in centre
E. Cross section of ripe fruit. In cultivated bananas the seeds do not mature

are used as fruits are *M. acuminata* in the Malay Archipelago, *M. Fehi* in Tahiti, and *M. Cavendishii*, the so-called Chinese banana, in cooler countries; the fruit of the last-named has a thinner rind and a delicate, fragrant flesh. The species, the fruits of which require cooking, are of much greater importance as an article of food. These often reach a considerable size; forms are

The means of communication in their province are good since both the Maros and the Theiss are navigable while much traffic passes along the Danube. One main railway line only passes through the province, namely that from Orsova to Temesvar and Szegedin. Wine and corn constitute the principal produce and tobacco is grown. Tin, lead and zinc are found. In the mountainous region on the east of the province, which is largely populated by Rumanians, there are important coal mines at Anina and in the Szekul valley which produce coal that resembles Welsh coal. Iron and steel works have developed in the coal regions. Timber is also produced in large quantities in the eastern regions, and the general prosperity of the whole province is remarkable. It escaped most of the ravages of the war and is now peaceably adjusting itself to its new conditions.

BANBRIDGE, town, Co. Down, Northern Ireland, 23m. S.W. of Belfast on a branch of the Great Northern railway. Pop. of urban district (1921), 5,101. To mitigate a steep ascent, a central carriage-way, 200yd. long, is cut along the main street to a depth of 15ft., the opposite terraces being connected by a bridge. Banbridge, an entirely modern town, is the principal seat of the linen trade in the county, and has extensive cloth and thread factories, bleachfields and chemical works. A memorial in Church square commemorates Captain Francis Crozier of the Franklin North-West Passage expedition.

BANBURY, municipal borough, Oxfordshire, England, on the river Cherwell, 86 miles N.W. of London by the northern line of the Great Western Railway. Population of municipal borough containing also GRIMSBURY and NETHROP parishes (1921) 13,340. There was an early settlement on the site; a battle being fought here in 556 between Cynric and Ceawlin and the British. It was assessed at 50 hides in the Domesday survey, when it was held by the bishop of Lincoln. There are slight traces of a castle built in 1125. From about the same time there are records of a market. The first charter of incorporation (1553) instituted a council, a court of record, one justice of the peace, a Thursday market, and two annual fairs. A new charter (1718) held until the Municipal Corporations act of 1835. During the 17th century the inhabitants of Banbury seem to have been zealous Puritans, and are frequently satirized by contemporary dramatists. To them is due the destruction of the ancient Banbury Cross, celebrated in nursery rhyme. A magnificent Gothic church was destroyed in 1790 to make way for a new building. The town retains, however, some fine old timbered houses. It is the centre of a rich agricultural district, and there is a large manufacture of agricultural implements. Other industries include rope and leather works and brewing. The cattle market is held in the main street. The name of the town is celebrated as that of a species of currant pastry said to have a reputation of three centuries' standing. Banbury is an important rail junction, with lines owned by the G.W.R., L.N.E.R. and L.M.S.R. It is governed by a mayor, six aldermen and 18 councillors and forms part of the Banbury parliamentary county division. Area 4,633 ac.

BANCA D'ITALIA, a joint-stock bank with a capital of 240 million lire, since June 1926 the sole bank of issue of the kingdom of Italy. Founded in 1893, it is of comparatively recent growth, but it can claim a long line of descent, tracing back to the famous Genoese Bank, the *Casa San Giorgio* (see GENOA; CORSICA).

The amalgamation in 1849 of the *Banca di Sconti, depositi e conti correnti* of Genoa with the *Banca di Torino*, both operating in the kingdom of Sardinia, gave rise to the *Banca Nazionale*, which on the constitution of the kingdom of Italy in 1859 shared the note issue privilege with the *Banca Nazionale Toscana*, the *Banca Toscana di Credito*, the *Banca Romana*, the *Banco di Napoli* and the *Banco di Sicilia*, all operating prior to Italian Unity as banks of issue in their respective States. By a law enacted in 1893 the *Banca Romana* was liquidated while the *Banca Nazionale Toscana* and the *Banca Toscana di Credito* amalgamated with the *Banca Nazionale* to form the *Banca d'Italia*, which thus became the third bank of issue and so remained until the decree-law of July 1, 1926, conferred on it the sole right to issue notes.

Until then the codified Act of 1910 regulating the three banks

of issue (*Italia, Napoli* and *Sicilia*) had unified their monetary policy. The fundamental principles of that Act provided for notes issued on "trade account" a cover of not less than 40% in gold or equivalent valuta, and for those issued to make advances to the Treasury a cover of 33%. A fixed ratio of this cover formed the "irreducible reserve" on which a privileged credit was inscribed in favour of the Bank's note-bearers. Until Dec. 20, 1927, the reserve was entered on the balance sheet of the *Banca d'Italia* at its pre-war gold parity (25.15 lire = £1).

In Italy as elsewhere, the World War began a period of inflation for the banks of issue. They had to lend freely to the Government and to issue notes against these loans, and their note circulation rose from 2,283.3 million lire in 1913 to 18,551.6 million in 1919 of which 2,270.3 issued on behalf of the Treasury.

To meet the industrial situation created by the war a consortium for subsidies on industrial securities was established by a decree of Dec. 20, 1914, with the right to rediscount a percentage of its bills with the banks of issue. Post-war financial and industrial inflation further aggravated the situation, and in March 1922 an "autonomous" section of this consortium, placed under separate management, was opened to facilitate the liquidation of the frozen credits which gave rise to the failure of the *Banca Italiana di Sconto* and the consequent banking crisis at the end of 1921. As a result of these various operations the currency circulation was further inflated by notes representing active transactions of the "ordinary" section of the consortium and by others representing the assets which the special "autonomous" section (whose activities ceased on Dec. 31, 1923) was seeking to realize. In the early months of 1925 the value of the bills thus discounted by the *Banca d'Italia* had risen to over 4,000 million lire and represented a serious source of inflation.

In 1926 the "autonomous" section of the consortium was closed down and a Liquidating Institute took over all the assets of the former body which it is gradually realizing. At the end of 1926 the debt of this Institute to the *Banca d'Italia* stood at 2,659.9 million lire; on Jan. 10, 1928, it had fallen to 1,331.9 million.

To face possible losses arising from these operations, reserves have been formed by ear-marking a percentage of the annual profits of the *Banca d'Italia*, and by ascribing thereto the proceeds of the tax on circulation.

The effect of war finance on the situation of the *Banca d'Italia* and the improvement since 1921 are shown in the following table:

(00,000 omitted.)	Three banks of issue.		Bank of Italy.	
	End 1913.	End 1921	End 1926.	Jan. 10, 1928.
Reserve held	1,661.4	1,989.4	2,478.5	12,105.6
Discounts and advances to customers Ltd.	857.1	10,020.4	8,039.8	6,083.2
Advances to the State Ltd.	..	8,504.8	4,229.4	..
Credit with the <i>Istituto di Liquidazioni</i>	Lire =	=	2,659.9	1,331.9
Note circulation	" 2,283.5	19,208.9	18,340.1	17,768.4
Demand drafts	" 230.0	1,981.2	801.2	584.1
Current and deposit accounts	" 88.1	931.3	1,431.2	2,366.0
Treasury balances	" 145.7	1,047.1	95.7	441.3

Until the close of 1927 the reserves were expressed in lire at the pre-war parity (lire 25.15 = £1) but since legal stabilization they have been expressed in lire at the new parity (lire 92.46 = £1).

Following on the decree of July 1926 unifying the note issue, the *Banca d'Italia* took over 3,782 million lire of outstanding notes of the banks of Naples and Sicily, together with their metallic and gold exchange cover (310.8 million lire) and credits valued at 802 million lire held by them against the autonomous section of the Consortium.

The remaining notes of the two Banks, amounting to 462 million lire, were retired with their own resources.

Deflation Policy.—In pursuance of its policy of deflation and monetary rehabilitation the Treasury in Sept. 1926 paid off 2,500 million lire of its debt to the *Banca d'Italia*, represented by notes issued on behalf of the Treasury, by transferring to it the 90 million dollars in its possession as the proceeds from the 100 million

loan obtained from the Morgan Bank in Nov. 1925. By the same decree normal note circulation was fixed at 7,000 million lire, plus the 2,500 millions of Treasury notes previously referred to, the 3,782 millions of notes taken over from the Banks of Sicily and Naples, and certain outstanding issues to the Treasury and the liquidation consortium. At the same time, the Government agreed to begin the repayment of its outstanding debt to the *Banca d'Italia*.

This decree also vested in the *Banca d'Italia* powers of inspection and supervision over the operations of all Italian deposit banks; it already held all the capital of the *National Institute of Exchange*, and so had the control of the foreign exchange market in Italy. During 1926-27, the bank was engaged in accumulating reserves of gold and "foreign exchange assets," helped therein by the deflationary policy of the Government and by the influx of foreign capital in the form of loans to productive industries.

The success of this policy is shown by an analysis of the reserves held by the *Banca d'Italia* on Jan. 10, 1928. They were at 12,105.6 million lire, consisting of 4,547.1 million lire in gold, 6,694.4 million in foreign credits, and 864 million in foreign Treasury certificates, a reserve which afforded a 57.20% cover to liabilities for notes and all sight debts. This reserve is exclusive of £22,200,000 deposited abroad at the time of the war, which will be gradually returned to the Bank under the London agreement for Italy's war debt settlement.

This strong financial situation and the fact that the Bank was no longer held in subjection to the Government by a dangerous floating debt and huge advances to the Treasury but had reacquired its full independence as a financial organ, enabled the *Banca d'Italia* to treat on a footing of equality with the great central banks in view of the stabilization of the lira which the Government had in view and carried out by the decree-law of Dec. 21, 1927.

This decree put an end to the inconvertible paper currency regime, in force since 1894, and re-established Italian currency on the gold basis. The *Banca d'Italia* is now required to redeem its notes on demand in gold coin or foreign gold exchange valuta at a gold parity of 0.0791911 grammes, equivalent to a mint parity of 5.26315 cents, approximately at the rate of 19 lire to the dollar and 92.46 lire to the pound sterling.

The bank is required to retain gold or gold exchange valuta reserves amounting to at least 40% of the total of outstanding note circulation and all other demand liabilities. It was at the same time authorized to revalue its reserves—which had been carried on its books at the old par of 5.18 to the dollar—on the new basis, the resulting excess being applied to extinguishing the outstanding debt of the Treasury to the bank. The item "notes issued on State account" has thus disappeared from the monthly statement published by the bank. To the *Banca d'Italia* is entrusted the duty of keeping the exchange within the "gold points," on the lines followed by the Bank of England. The decree of Dec. 21, 1927, leaves it free to determine its own policy with regard to the ratio between its gold and gold exchange reserves. It regulates the trend of the money market by its rate of discount, and is definitely tending to become exclusively the "bankers' bank."

(O. R. A.)

BANCHIERI, ADRIANO (c. 1557-1634), Bolognese composer for church and stage, organist, writer on music and poet. He founded the Accademia Florida of Bologna. Like Orazio Vecchi he was interested in converting the madrigal to dramatic purposes. He disapproved of the monodists with their revolutionary harmonic tendencies, about which he expressed himself vigorously in his *Moderna Practica Musicale* published at Venice in 1613, while systematizing the use of the monodic art of thoroughbass.

BANCROFT, GEORGE (1800-1891), American historian and statesman, was born in Worcester, Mass., on Oct. 3, 1800. His family had been in America since 1632, and his father, Aaron Bancroft, was distinguished as a revolutionary soldier, clergyman and author. The son was educated at Phillips academy, Exeter, at Harvard university, at Heidelberg, Göttingen and

Berlin. At Göttingen he studied Plato with Heeren, New Testament Greek with Eichhorn and natural science with Blumenbach. His heart was in the work of Heeren, easily the greatest of historical critics then living, and the forerunner of the modern school; it was from this master that Bancroft caught his enthusiasm for minute painstaking erudition. Bancroft's father was a Unitarian, and he had devoted his son to the work of the ministry; but the young man's first experiments at preaching, shortly after his return from Europe in 1822, were unsatisfactory. His first position was that of tutor in Harvard. Instinctively a humanist, he

HOME OF AARON BANCROFT AT WORCESTER, MASSACHUSETTS, WHERE GEORGE BANCROFT, AMERICAN HISTORIAN AND STATESMAN, WAS BORN ON OCT. 3, 1800

had little patience with the narrow curriculum of Harvard in his day and the rather pedantic spirit with which classical studies were there pursued. He found the conventional atmosphere of Cambridge uncongenial, and with a friend he established the Round Hill school at Northampton, Massachusetts. This was the first serious effort made in the United States to elevate secondary education to its rightful plane. Although born into a Whig family, yet Bancroft's studies carried him irresistibly into the Democratic party. While a teacher in his own school he was elected to the state legislature as a Democrat, but refused to serve. In 1831 he likewise declined the nomination of the Massachusetts Democrats for secretary of state. By this time he was influential in the councils of his party, and President Van Buren appointed him collector of the port of Boston, a position which he filled with success. Two of his appointees were Orestes Brownson and Nathaniel Hawthorne. In 1844 he was the Democratic candidate for the governorship, but he was defeated. In 1845 he entered Polk's cabinet as secretary of the navy, serving until 1846, when for a month he was acting secretary of war. During this short period in the cabinet he established the naval academy at Annapolis, gave the orders which led to the occupation of California, and sent Zachary Taylor into the debatable land between Texas and Mexico. He also continued his pleadings for the annexation of Texas, as extending "the area of freedom," and though a Democrat, took high moral ground as to slavery; he likewise made himself the authority on the North-Western Boundary question. In 1846 he was sent as minister to London, where he lived in constant companionship with Macaulay and Hallam. On his return in 1849 he withdrew from public life, residing in New York. In 1867 he was appointed minister to Berlin, where he remained until his resignation in 1874. Thenceforward he lived in Washington and Newport, dying at Washington on Jan. 17, 1891. His latest official achievements were the greatest. In the San Juan arbitration he displayed great versatility and skill, winning his case before Emperor William I. of Germany, who acted as arbitrator, with brilliant ease. The naturalization treaties which he negotiated successively with Prussia and the other north German states were the first international recognition of the right of expatriation, a principle since incorporated in the law of nations.

In spite of the exacting routine of the Round Hill school, Bancroft contributed frequently to the *North American Review* and to Walsh's *American Quarterly*; he also made a translation of Heeren's work on *The Politics of Ancient Greece*. In 1834 appeared the first volume of the *History of the United States*. The second followed in 1837, and others as the exigencies of public life permitted. Supplementary to the first volume was an article published by him in the *North American Review* for 1835 on "The Documentary History of the Revolution." This article not merely brought the new method to the notice of the reading public, but revealed to it the wealth of material available. The nature and extent of his studies, the solidity of his work, and the philosophic spirit which animates both, explain the enthusiasm with which the earlier volumes of Bancroft were received. Their sale at home

was very large; they were reprinted in England and translated immediately into Danish, Italian, German and French. The latest volumes were considered by all competent judges quite as important as their predecessors.

As Heeren's pupil, he laid enormous stress on the importance of original authorities. In dealing with documentary evidence he sought to apply very stringent rules:—(1) Carefully distinguish between original authority and historical memorials or aids; for example, between a fact recorded at first- or second-hand knowledge, and a decision of principle by authority. (2) Represent every man from his own standpoint; judge him from your own. His collections of original materials were vast; beginning with his residence in England, he brought together at enormous pains and expense the authenticated copies of archives, family papers, and personal journals written by historic personages, which now constitute an invaluable treasure in the New York public library. They are from every land and from every people with which American origins are connected.

Bancroft's imagination and enthusiasm were alike exuberant. His pages abound in fine and acute insight. His generalizations are vivid and enlightening. He spared no pains to acquire true style, frequently rewriting his chapters, and sometimes testing passages of philosophy and description in eight different forms. Yet to a certain extent he lacked the representative power and often failed to conceal his art, many pages ringing with artificial tones. But, after making all allowances, it remains true that he had a perfect sense of proportion, sound maxims and thorough common sense. He was of that greatest human type: a man of the present, valuing justly the past and no dreamer. In the nature and extent of his studies, in the solidity of his work, and in the philosophic spirit which animated his life he ranks as the foremost historian of the United States, and as an American historian second to none of his European contemporaries in the same line. He displayed the heroic, epic value of American history, its unity with the great central stream, and dispelled for ever the extravagant conceptions of a sentimental world just emerging from the visionary philosophy of the 18th century.

See M. A. de Wolfe Howe, *The Life and Letters of George Bancroft* (1908); John Spencer Bassett, *The Middle Group of American Historians* (1917); John Spencer Bassett (Ed.), "Correspondence of George Bancroft and Jared Sparks," in *Smith College Studies in History*, vol. ii. No. 2 (1917); John T. Faris, *Men Who Conquered* (1922).

BANCROFT, HUBERT HOWE (1832-1918), American historical writer, was born at Granville (O.), May 5, 1832. As a bookseller in San Francisco (1852-68) he accumulated a great library of historical material, and at last gave up business in order to devote himself to the publication of his *Native Races of the Pacific States* (5 vols., 1874-76), his many volumes on the western States, and other works. For the collection of data and for the writing in parts, he relied upon the labours of a corps of assistants, and the publications named represent, properly speaking, an encyclopaedia rather than a unified history; but as a storehouse of material their value is great. In 1905 Bancroft's vast collection was acquired by the University of California. An account of his methods of work is given in his *Literary Industries* (1890) and *Retrospection, Political and Personal* (1912). He died at Walnut Creek (Calif.), March 2, 1918.

See *Oregon Historical Quarterly*, vol. iv., pp. 287-364 for identification of Bancroft's literary assistants.

BANCROFT, RICHARD (1544-1610), archbishop of Canterbury, was born at Farnworth, in Lancashire. He was educated at Cambridge. He received important preferments and came into prominence through a passionate sermon against the Puritans preached at Paul's Cross on Feb. 9, 1589. He was chaplain successively to Lord Chancellor Hatton and Archbishop Whitgift. In June 1597 he was consecrated bishop of London; and from this time, in consequence of the age of Archbishop Whitgift, he was virtually invested with the power of primate. Among the more noteworthy cases which fell under his direction were the proceedings against "Martin Mar-Prelate," Thomas Cartwright and his friends, and John Penry, whose "seditious writings" he caused to be intercepted and given up to the lord keeper. In 1600 he

was sent on an embassy to Embden, for the purpose of settling certain matters in dispute between the English and the Danes. He took a prominent part in the famous conference of prelates and Presbyterian divines held at Hampton Court in 1604. By the king's desire he undertook the vindication of the practices of confirmation, absolution, private baptism and lay excommunication; he urged, but in vain, the reinforcement of an ancient canon, "that schismatics are not to be heard against bishops." In March 1604 Bancroft, on Whitgift's death, was appointed president of convocation then assembled; and in the following November he was elected successor to Whitgift in the see of Canterbury. In 1608 he was chosen chancellor of the university of Oxford. Bancroft was "the chief overseer" of the authorized version of the Bible.

BANCROFT, SIR SQUIRE (1841-1926), English actor and manager, first appeared in 1861 at Birmingham, and played in the provinces for several years. His first London appearance was in 1865 in Wooler's *A Winning Hazard* at the Prince of Wales's theatre, under the management of Effie Marie Wilton (b. 1840), whom he married in 1868. Mr. and Mrs. Bancroft were associated in the production of all the Robertson comedies (see ROBERTSON, THOMAS WILLIAM).—*Society* (1865), *Ours* (1866), *Caste* (1867), *Play* (1868), *School* (1869), and *M.P.* (1870), and, after Robertson's death, in revivals of the old comedies, Lytton's *Money* (1872), Boucicault's *London Assurance* (1877), and *Diplomacy*, an adaptation of Sardou's *Dora*, were among their productions. The Bancroft management at the Prince of Wales's theatre had the effect of reviving the London interest in modern drama. In 1879 they moved to the Haymarket, where Sardou's *Odette* (for which they engaged Madame Modjeska) and *Fédora*, W. S. Gilbert's *Sweethearts* and Pinero's *Lords and Commons* were produced. They retired in 1885, but Mr. Bancroft (who was knighted in 1897) joined Sir Henry Irving in 1889 to play the abbé Latour in a revival of Watts Phillips's *Dead Heart*. Lady Bancroft died in 1921; Sir Squire Bancroft died on April 19, 1926.

See *Mr. and Mrs. Bancroft, on and off the Stage* (1888), and *The Bancrofts: Recollections of Sixty Years* (1909), by themselves, also *Empty Chairs* (1925), a volume of reminiscences, by Sir Squire Bancroft.

BAND, something which "binds" or fastens one thing to another, hence a cord, rope or tie, e.g., the straps fastening the sheets to the back in book-binding. The word is a variant of

"bond," and is from the stem of the Teutonic *bindan*, to bind. From the same source comes "bend," properly to fasten the string to the bow, so as to constrain and curve it, hence to make into the shape of a "bent" bow, to curve. In the sense of "strap," a flat strip of material, properly for fastening anything, the word is ultimately of the same origin but comes directly into English from the French *bande*. In architecture the term is applied to a sort of flat frieze or fascia running horizontally round a tower or other parts of a building. When a band is used horizontally to subdivide the outside face of a building, it is known as a band or string course.

TYPES OF ARCHITECTURAL BANDS
A. Classic band decoration known as the "Vitruvian" or wave scroll; B. French Gothic, Amiens Cathedral (13th century); C. English perpendicular Gothic, St. Mary's, Oxford (15th-16th centuries)

The two small strips of linen, worn at the neck as part of legal, clerical and academic dress, are known as "bands"; they are the survival of the falling collar of the 17th century. These bands are usually of white linen, but the secular clergy of the Roman Church wear black bands edged with white. The light cardboard boxes now used to carry millinery were formerly made to carry the neckbands, whence the name of "band-box."

In the sense of company or troop, "band" is probably also connected with *bindan*, to bind. It came into English from the French. The meaning seems to have originated in Romanic, cf.

Italian, Spanish and Portuguese *banda*, and thence came into Teutonic. It has been taken (*see* Ducange, *Gloss. s.v. banda*) to be due to the "band" or sash of a particular colour worn as a distinctive mark by a troop of soldiers. Others refer it to the mediaeval Latin *bandum*, banner, a strip or "band" of cloth fastened to a pole.

Military bands constitute an essential feature of all armies, each regiment having its own as a rule. The training of bandmasters for the British service is carried out at Kneller Hall, Hounslow, an institution founded in 1857 and placed under direct control of the war office in 1867. The instruments composing an average British military band number nowadays 30 or more, including piccolo, flutes, clarinets, oboes, bassoons, saxophones, horns, cornets, trumpets, trombones, euphoniums and drums. Of Scottish regiments the peculiar instrument is the bagpipes. Cavalry and artillery corps in the various armies have small bands. In the navies of various countries bands are maintained on board flag-ships and sometimes on board other large ships.

BANDA, a town and district of British India, in the Jhansi division of the United Provinces. The town is near the right bank of the river Ken, 95m. S.W. of Allahabad. The population in 1921 was 20,029.

The district contains an area of 2,965 sq. miles. Irregular uplands with outcrops of rock intermingle with marshy lowlands, frequently under water in the rainy season. The Jumna skirts the district for 125m., and has a fringe of destructive and extending ravines. To the south-east the Vindhya chain of hills begins in a low range not above 500ft. in height, forming a natural boundary of the district in that direction. In 1921 the population was 613,114. The black soil of the district yields crops of millet, other food-grains, pulse, rice, cotton and oil-seeds; but the land is arid, rainfall precarious and serious drought recurring. The peasantry are for the most part impoverished and indebted.

Banda has often been the battle-ground of successive races who have struggled for the sovereignty of India. Kalinjar town, then the capital was unsuccessfully besieged by Mahmud of Ghazni in A.D. 1023; in 1196 it was taken by Kutub-din, the general of Mohammed Ghori; in 1545 by Sher Shah, who, however, fell mortally wounded in the assault. About the year 1735 the rajah of Kalinjar's territory, including the present district of Banda, was bequeathed to Baji Rao, the Mahratta peshwa; and from the Mahrattas it passed by the treaties of 1802-1803 to the East India company.

BANDAGES AND BANDAGING. A bandage is a strip or piece of woven material used to bind up wounds. Its general use is to retain dressings or splints in position; to give support to a part of the body; and to exert pressure to stop or prevent bleeding. There are four kinds of bandages; the triangle, roller, four-tailed and many tailed. In medical usage each method of bandage application is given a distinctive name. For example, a roller bandage applied in spiral form to cover each finger and the hand is called a *gauntlet*.

The triangle is the most useful bandage for emergencies as it fulfils every need in bandaging; because it is easily made, is easy to apply, will stay on, will cover any part of the body, and little danger of injury to flesh or blood vessels results from its application. The triangle bandage is usually made by cutting diagonally muslin or gauze 36 to 40in. square. As an open triangle it is used as a sling for the arm, as a bandage to cover the head, the hand or the foot. It is folded to make various widths in order to adapt it best for use on the various parts of the body. When folded repeatedly it becomes the "cravat" bandage in which form it may be used for a sling, or to cover the palm of the hand, the eyes or the ears. When made of surgical gauze and kept sterile it is suitable to use directly on a wound the same as any surgical dressing, either with or without the addition of solutions or ointments. The cotton or muslin bandage is stronger and therefore more suitable for the application of pressure or to give support.

Another common type of bandage is the roller bandage, from 1 to 5in. or more in width, averaging 10yds. in length, and rolled longitudinally. It is usually applied spirally. The material of

this bandage is usually muslin, flannel, gauze or cheese-cloth, gauze or cheese-cloth being preferred for elasticity. The four-tailed bandage, for which 5 to 8in. wide x 2 to 3ft. long is a representative size, is useful for injuries of the lower jaw and head, elbow and knee. The many tailed bandage is an elaboration of the four tailed bandage and its uses are similar.

Bandaging.—Bandages applied to meet various needs and positions of the body are given special names by the medical profession, etc. Among them are: Esmarch's "figure-of-eight" bandage, in which the turns cross each other like a figure 8; the circular bandage applied to a part in circular turns; the gauntlet and demi-gauntlet hand bandages; Desault's bandage for a fractured clavicle; the oblique, pressure, suspensory, reversed, spiral and spiral reverse bandages; the T-bandage; the Spica, which is a spiral folded regularly on itself like the letter V for use at the junction of a limb to the body. Some bandages are made of special materials to meet specific needs, e.g., the roller bandage of crinoline filled with plaster of Paris or splints; starch, silica and dextrin bandages for stiff and immobile dressings; the india-rubber bandage for flexible support as in varicose veins, and numerous other highly specialized bandages. (W. R. R.)

BANDA ISLANDS, in the Banda sea, Dutch East Indies, 130m. south-east of Amboyna, and 60m. south of Ceram, in the Residency of Amboyna. The ten islands cover only 20 sq.m. The three largest are Lontor, or Great Banda (7½m. long), Banda Neira, and Gunong Api, grouped around an inland sea which forms the Banda harbour; Lontor, sickle-shaped, lies south and east, Banda Neira to the north, with Gunong Api to the west. The arrangement is comparable with that of Santorin in the Aegean sea, and undoubtedly these three islands form part of the rim of a crater. West and south-west of Gunong Api are Wai and Run, and north and north-west, Pisang and Suwangi. Channels on either side in the south of Banda harbour enable vessels to enter with safety during either monsoon, whilst a northern passage, between Gunong Api and Banda Neira, is navigable for small vessels. Lontor has coral rock to a height of 400ft., with lava and basalt above, and is certainly volcanic, whilst Gunong Api (1,858ft.), is an active volcano which caused destruction in 1820 and 1852. It is covered with bushes to within 700ft. of the summit, which exhibits various shallow and extinct crater-basins and a hot, smoking plain, sending forth sulphurous vapours and covered with split lava-blocks. The volcanic soil, however, is admirably adapted to the growth of the nutmeg, which is indigenous. The average amount of nutmegs and mace exported from Amboyna is 2,000,000lb. and 500,000lb. respectively, and most of this comes from Banda. Other products are cloves, cinnamon, vanilla, coconuts, tapioca and various tropical fruits and vegetables. The population of the islands is 10,364, of whom 6,000 live in Banda Neira, the capital, on the island of that name, the port for the group.

The people are a mixed race, mostly descendants of Javanese, Macassarese, and people from neighbouring islands brought in by the Dutch as slaves to work the nutmeg plantations in the place of the Bandanese, who refused to do so, and were either killed or banished; there exists still a colony of exiled Bandanese on one of the neighbouring Ké group, who, alone, use the old Bandanese language. On Gunong Api there is a small colony of Butonese. On Banda Neira there are many Arab and Chinese traders, and some Malays, with a few Europeans and Eurasians, officials and persons engaged in business. (The Dutch Government is represented by a Contrôleur.) Agriculture and fishing are the occupations of the natives, many of whom are Christian.

Trade is in Chinese and Arab hands. The Royal Mail Packet Company provides communication with Amboyna. There are roads sufficient for the needs of the population, and a wireless station. The approach, especially from the north, is very beautiful, likewise the scenery about the inland sea, whilst the marine gardens beneath this are probably unrivalled.

The Banda islands were discovered and annexed by the Portuguese Antonio d'Abreu in 1512, but in the beginning of the 17th century the Dutch expelled the Portuguese and established themselves, in spite of native opposition, on Banda Neira and built

a fort there. An English expedition under Captain Keeling arrived at Banda about this time and endeavoured unsuccessfully to establish a footing on Banda Neira, and about a year later Captain Middleton also failed. A small English settlement left on Wai was raided and destroyed by the Dutch as soon as the protecting English vessel had left, but, Dutch hostility notwithstanding, English influence made headway on Lontor, Run and Wai, and in 1621 the Dutch, anxious to make an end of native rule, proposed a joint Anglo-Dutch conquest of the islands. The English declined to co-operate, whereupon the Dutch crushed Bandanese resistance in a ruthless fashion and ruled the islands under a governor, soon afterwards eliminating the English element in the islands. It was alleged English participation against the Dutch in a native revolt on the island of Run which led to the Amboyna Massacre, as a result of which, in 1654, under pressure from Cromwell (*see* AMBOYNA), Run was awarded to the descendants of those who perished in Amboyna. It was held until the reign of Charles II. (1664), when the Dutch captured it. In 1796 the islands were taken by a British naval force, restored to the Dutch in 1800, retaken during the Napoleonic War, and restored finally by the Treaty of Paris of 1814.

BANDANA or **BANDANNA**, a word probably derived from the Hindustani *bāndhnū*, which signified a primitive method of obtaining an effect in dyeing by tying up cloth in different places to prevent the particular parts from receiving the dye. The name was given to richly coloured silk handkerchiefs produced by this process. Bandanas are now commonly made of cotton and produced in Lancashire, whence they are exported. The effect is also produced by a regular process in calico printing, in which the pattern is made by discharging the colour. In the United States, bandanas enjoyed popularity on western cattle ranches, and among the negro population of the southern states.

BANDAR ABBAS, a port of Persia on the Strait of Ormuz, 27° 11' N. and 56° 17' E., being one of the "Gulf ports" which form an administrative division of the Persian province of Fars and Southern Ports. The town is the seat of the Persian deputy governor who is subordinate to the governor of the Gulf ports whose headquarters are at Bushire. Estimated population about 10,000. It stands on the beach with a frontage of 1½ m. and is a place of considerable trade, being the entrepôt for goods destined for the south-eastern part of Persia the two chief towns of which are Kerman and Yazd, to which former place four caravan routes lead. The shallow roadstead is not well sheltered from the south-east winds; and large vessels have to lie as much as four miles out. The total trade in 1925-26 amounted to 20,000 tons (of which 16,000 tons were British) exports being valued at £350,000 and imports at about £1,000,000. The principal articles of export were carpets, fresh and dried fruits, raw cotton, wool, gum, and assafoetida. The vessels of the British Indian Steam Navigation company's subsidiary mail service between Bombay and Basra call weekly on their passages both up and down the gulf; and there is an occasional service by other lines. A British consulate has been established there since 1902. Bandar Abbas has telegraphic communication by cable, but there is no land line, messages for places in the interior being sent through Bushire. There is telephonic communication with Hanjam island, where a radio-station has been erected to maintain communication with ships. The climate though hot is not unhealthy and from October to April is pleasant.

Bandar Abbas (the port of Abbas) was founded by Shah Abbas I., who gave this name to the village of Gumrun or Gombrun, and planned to make his foundation the centre of a foreign trade which was to be gradually developed. As the successor of Hormuz (*q.v.*)—which was abandoned after that island was wrested from the Portuguese and the town destroyed in 1622—Bandar Abbas inherited and filled for over a century the rôle of premier maritime city of Persia. The English were permitted to build a factory there and about 1620 the Dutch obtained a like privilege. But a rival arose in the port of Bushire, called into being by Nadir Shah, which soon obtained the commercial supremacy of the Persian gulf. In 1759 the English factory was destroyed by the French and eventually the trading activities of the East India company

were transferred to Basra and then to Bushire. During a period from about 1780 the town and surrounding district were in the hands of the rulers of Muscat but, in 1868, the then sultan was expelled by a successful revolt and the Persian Government has retained complete possession of the place ever since.

See G. N. Curzon, *Persia and the Persian Question* (1892); P. M. Sykes, *10,000 miles in Persia* (1902); A. T. Wilson, *The Persian Gulf, An Historical Sketch* (1928).

BANDARAWELA, a hill-station of Ceylon, situated 80 m. almost due east of Colombo, 4,036 ft. above sea-level, on the Kandy-Badulla railway. It possesses a good hotel, surrounded by numerous private bungalows. It enjoys a delightful climate, which is cool and bracing but warmer than that of Nuwara Eliya. Population in 1921 was 1,686.

BANDELIER, ADOLPH FRANCIS ALPHONSE (1840-1914), American archaeologist, was born in Bern, Switzerland, on Aug. 6, 1840. When a youth he emigrated to the United States. After 1880 he devoted himself to archaeological and ethnological work among the Indians of the south-western United States, Mexico and South America. He studied in Sonora (Mexico), Arizona and New Mexico, and became one of the leading authorities on the prehistoric civilization of this region. In 1892 he abandoned this field for Ecuador, Bolivia and Peru, where he continued ethnological, archaeological and historical investigations. Bandelier showed the falsity of various historical myths, notably in his conclusions respecting the Inca civilization of Peru.

His publications include three studies "On the Art of War and Mode of Warfare of the Ancient Mexicans," "On the Distribution and Tenure of Lands and the Customs with respect to Inheritance among the Ancient Mexicans" and "On the Social Organization and Mode of Government of the Ancient Mexicans" (Harvard university, Peabody Museum of American Archaeology and Ethnology, *Annual Reports*, 1877, 1878, 1879); *Historical Introduction to Studies among the Sedentary Indians of New Mexico, and Report on the Ruins of the Pueblo of Pecos* (1881); *Final Report of Investigations among the Indians of the South-western United States* (1890-92); *Contributions to the History of the South-western Portion of the United States carried on mainly in the years from 1880 to 1885* (1890)—all these in the *Papers of the Archaeological Institute of America*, American series, constituting vols. i.-v.; *The Gilded Man (El Dorado) and other pictures of the Spanish Occupancy of America* (1893). He also edited *The Journey of Alvar Nuñez Cabeza de Vaca . . . from Florida to the Pacific, 1528-1536* (1905), translated into English by his wife. He died in Madrid on March 19, 1914. His last published works were *The Islands of Titicaca and Kouti* (1910) and *The Ruins of Tiakuanaco* (1912).

See C. F. Loomis, *Adolph Francis Alphonse Bandelier* (1914); also Waterman, *Bandelier's Contribution to the Study of Ancient Mexican Social Organization* (1917).

BANDELIER NATIONAL MONUMENT, a tract embracing about 34 sq. m. in the north central part of New Mexico, U.S.A. It became a Government reservation in 1916 and is administered by the department of agriculture. It is the site of a great number of prehistoric artificial caves, immense cliff dwellings, stone sculptures and other evidences of the vanished civilization of the American South-west.

BANDELLO, MATTEO (c. 1480-1502), Italian novelist, was born at Castelnovo, near Tortona. He received a very careful education, and entered the church, though he does not seem to have prosecuted his theological course with great zeal. For many years he resided at Mantua, and superintended the education of the celebrated Lucrezia Gonzaga, in whose honour he composed a long poem. The decisive battle of Pavia, which gave Lombardy into the hands of the emperor, compelled Bandello to fly; his house at Milan was burnt and his property confiscated. He took refuge with Cesare Fregoso, an Italian general in the French service, whom he accompanied into France. In 1550 he was raised to the bishopric of Agen, a town in which he resided for many years. Bandello wrote a number of poems, but his fame rests entirely upon his collection of *Novelle*, or tales (1554, 1573), which

belong to that species of literature of which Boccaccio's *Decameron* is the best known example. Their principal source is to be found in the old French *fabliaux*, though some well-known tales are evidently Eastern, and others classical. Historically, Bandello's tales are of interest for the insight they afford into the social life of the period and for the important influence they exercised on the Elizabethan drama. The plots of many Elizabethan plays were derived from Bandello, probably through Belleforest or Paynter.

BANDER LINGEH: see LINGEH.

BANDEROLE, a small flag or streamer carried on the lance of a knight, or flying from the mast-head of a ship, etc.; in architecture, a band used in sculpture of the Renaissance period for bearing an inscription, etc.

BANDICOOT, any animal of the marsupial genus *Perameles*. The species, about 12 in number, are widely distributed over Australia, and the adjacent islands. They are of small size and live on the ground, making nests in hollow places and forming burrows in which they pass a great part of the day. Though feeding largely on worms and insects they ravage gardens and fields, on which account they are detested by the colonists.

BANDICOOT-RAT, a large rat (*Nesocia bandicota*), inhabiting India and Ceylon, which measures from 12 to 15 in. to the root of the tail, while the tail itself measures from 11 to 13 in. It differs from typical rats by its broader incisors, and the less distinct cusps on the molars. Other species of the genus are found from Palestine to Formosa, as well as in Central Asia. See RODENTIA.

BANDIERA, ATTILIO (1811-1844) and **EMILIO** (1819-1844, Italian patriots. The brothers Bandiera, sons of Baron Bandiera, an admiral in the Austrian navy, were themselves members of that service, but they were won over to the ideas of Italian freedom and unity, and corresponded with Giuseppe Mazzini and other members of the *Giovane Italia* (Young Italy). The Bandieras began to make propaganda among the officers and men of the Austrian navy, nearly all Italians, and actually planned to seize a warship and bombard Messina. But having been betrayed they fled to Corfu early in 1844. Rumours reached them there of agitation in the Neapolitan kingdom, where the people were represented as ready to rise *en masse* at the first appearance of a leader; the Bandieras consequently determined to make a raid on the Calabrian coast. They got together a band of 19 men ready to sacrifice their lives for an idea, and set sail on their desperate venture on June 12, 1844. Four days later they landed near Cotrone, intending to go to Cosenza, liberate the political prisoners and issue their proclamations. But they did not find the insurgent band which they had been told awaited them, and were betrayed by one of their party, the Corsican Boccheciampe, and by some peasants who believed them to be Turkish pirates. On July 23 the two Bandieras and seven of their companions were executed; they cried *Viva l'Italia!* as they fell. The moral effect of their execution was enormous throughout Italy, the action of the authorities was universally condemned, and the martyrdom of the Bandieras bore fruit in subsequent revolutions.

See G. Ricciardi, *Storia dei Fratelli Bandiera* (Florence, 1863); F. Venosta, *I Fratelli Bandiera* (Milan, 1863); and Carlo Tivaroni, *L'Italia durante il dominio austriaco*, vol. iii., p. 149 (Turin, 1894).

BANDEROLE
Gothic and Renaissance examples of decorative or inscribed banderoles

THE BANDICOOT, WHICH FEEDS UPON INSECTS AND USES HIS STRONG CLAWS TO DIG UP ROOTS

BANDINELLI, BARTOLOMMEO or **BACCIO** (1493-1560), Florentine sculptor, the son of an eminent goldsmith, who taught his son the first elements of drawing. He was early placed under Rustici, a sculptor, and a friend of Leonardo da Vinci. The ruling motive in his life seems to have been jealousy both of Benvenuto Cellini and of Michelangelo, one of whose cartoons he is said to have torn up and destroyed. Among his best works must be reckoned the *bassi-relievi* in the choir of the cathedral of Florence; his copy of the Laocoön; and the figures of Christ and Nicodemus on his own tomb.

BAND OF FREQUENCIES, a continuous range of frequencies extending between two definite frequencies. In radio communication, frequency bands of various widths are allocated or assigned by international agreement for use by certain services such as, broadcasting, transoceanic, and ship-to-shore communication. The width of the frequency band required for use by a given radio station depends upon the type of transmission, for example, whether high or low-speed telegraphy, telephony, facsimile or television.

BANDOLIER or **BANDOLEER** (a little band), a belt worn over the shoulder by soldiers to carry cartridges. In the 17th century wooden cases were hung to the belt to contain powder charges. The modern bandolier carries the cartridges either in loops sewn to the belt or in small pouches, similarly attached, containing strips of several cartridges. In recent times it has been used mainly by mounted troops.

BANDON or **BANDONBRIDGE**, town, Co. Cork, Ireland, situated in a broad open valley on both sides of the river Bandon. Pop. (1926), 2,816. It is 20m. S.W. of the city of Cork by the Great Southern Railway. It is an important agricultural centre and there are distilleries, breweries and flour-mills. Two miles below Bandon on the river is Innishannon, the head of navigation. Bandon was founded early in the 17th century by Richard Boyle, earl of Cork, and was incorporated by James I. It returned two members to the Irish parliament and thereafter one to the imperial parliament until 1885. After the destruction of the walls by the Irish in 1689, Bandon long resisted the admission of Catholic inhabitants.

BAND-PASS ELECTRICAL WAVE-FILTER, a device designed to transmit or pass electric currents of frequencies within a continuous frequency band. Currents having frequencies beyond the critical or cut-off frequencies of this band are attenuated or are not transmitted. (See FILTER.)

BAND SAWS, wood saws consisting of a continuous band of steel carrying saw teeth on either or both edges and mounted on two wheels arranged above and below or at either side of a work-table. Power is applied to one of the wheels, moving the band at a high rate of speed, the other wheel being so mounted as to permit it to be moved away from the power wheel to insure tightness of the band during the cut. One of the first applications of the band saw principle is recorded in the British patent office, in connection with a patent issued to William Newberry in 1808. The development at first was slow due to the greater cost of manufacture in comparison to the circular saw. As the need of conserving lumber became more apparent the great saving, as much as 60% in favour of the band saw, hastened its development and adoption.

There are several forms of the band saw. The scroll saw, a simpler form, has an adjustable table for sawing bevels, and has the wheel bearings mounted on a column. Blades as narrow as $\frac{1}{16}$ in. are used and it is possible to turn the work as it is being cut so that intricate designs of small radius may be obtained. The band *rip* saw is equipped with a wider blade suitable for ripping any length of stock at high speed, and with feed rolls which grip the stock above and below. A variation of this type has an endless feeding chain in the table and with feed rolls above insures ripping on a straight line. The band re-saw has only a very narrow work-table, and thick planks are fed through to be cut into thinner boards. A variation of the re-saw consists of two blades offset so as to cut a plank into three boards at one passage. The largest form is the band *mill* saw which is used in the first cutting of timber into planks. The size of the wheels are often as much as

10 ft. in diameter and the blades as wide as 14 inches. The carriage upon which the log is mounted moves the timber sideways after each cut, an amount equal to the thickness of boards being cut, and draws it away from the band after the cut to prevent the band being pushed off the wheel. Some mills are made with teeth on both edges of the blade and a cut is made on both the forward and return movement. (W. S. W.)

A BAND RE-SAW IN ACTION

BAND SPECTRUM. A spectrum consists of lines showing certain definite regularities of arrangement. The so-called "line spectra" (*q.v.*) are attributable to atoms, and band spectra are due to molecules. Many of the features characteristic of band spectra may be seen in the Plate. All comprise a very large number of lines, which in places may be so closely packed as to be separately indistinguishable. In cases where analysis is possible the lines are found to close up in a perfectly regular manner, giving an appearance resembling that of a fluted column (*see* No. 5). Such a series appears to terminate abruptly at the point where the separation of the lines is least; this is called the head of the band, and is a prominent feature of most band spectra (*see* Nos. 4, 5, 6, 7, 10, 11). Such heads frequently occur in groups (*see* 7 and 10), and since a long series of lines is associated with each head there is apt to be considerable overlapping of series and consequent difficulty in analysis (*see* 5 and 13). Further, there is commonly a number of associated groups of heads forming what is known as a band system (*see* 10), and finally the totality of systems originating from a particular compound is termed the band spectrum of that compound. Thus, for example, cyanogen gives rise to one system (*see* 5) stretching from the blue into the ultraviolet, and another (*see* 6), very different in many respects, lying in the red, yellow and green.

Still further complexity, due to the double or triple character of the component lines, is quite common (*see* 4, 3, 8, 9). Again, a series may fade out before the head is reached (*see* 3), in which case the band structure is not always evident. It may be extremely difficult to recognize if there are numerous overlapping bands of this headless variety, each comprising few lines with relatively large spacing. The secondary hydrogen spectrum (*see* 1) is of this nature; the helium band spectrum (*see* 2) is of a character intermediate between this and the more usual type of band spectrum.

The spacing of the lines is roughly inversely proportional to the moment of inertia of the molecule. An extreme instance is seen when comparing the case of helium (*see* 2), for which the

moment of inertia is about $3.6 \times 10^{-40} \text{ gm.cm.}^2$ and the spacing about 10 Å.U. , with that of iodine (*see* 13), of moment of inertia 740×10^{-40} and spacing about $\frac{1}{70} \text{ Å.U.}$

Classification and Origin of Band Spectra.—Band spectra may be classified in various ways; *e.g.*, according to the process which gives rise to them (emission, absorption, fluorescence), to the nature of the energy change involved (electronic, vibrational, rotational), or to the type of molecule (diatomic, polyatomic, polar, symmetrical). On account of the complexity of the subject a general survey is given in the first part of this article, the second part being devoted to a somewhat more detailed treatment of the class which has been most extensively studied. As in the case of line spectra, the emission or absorption of a band line is a consequence of a transition from one to another of a set of stationary states and the frequency of the line is proportional to the difference of energy in the two states. A particular state is only found to combine in this way with a limited number of other states, but the number of possible states of a molecule is so great that in spite of this limitation the spectrum is usually exceedingly rich in lines.

The energy of molecules may differ in any or all of three respects:—(a) The electron configuration, which appears to resemble that characteristic of atoms, in that it can be classified in groups or sequences having a particular quantum number in common. (b) The vibration of the atomic nuclei. In the case of a diatomic molecule this consists of a to and fro motion along the line joining them. Its precise nature is determined by the force called into play when the nuclei are displaced from their equilibrium positions, but the energy, and therefore also the amplitude, of the vibration can only assume certain definite values. (c) The rotation of the molecule as a whole, which again is quantized, so that only certain definite speeds of rotation occur.

Rotation and Vibration Bands.—The contribution of (a) to the total energy is usually larger than that of (b), which again exceeds that of (c). Since also the change in the rotational quantum number is limited to one unit the bands which are due solely to rotation changes are of very low frequency, lying far out in the infra-red towards 100μ ($1,000\mu = 1\text{mm}$), where experimental difficulties are very great. Nevertheless, sufficient data have been secured (*e.g.*, for HCl , H_2O , CO_2 , NH_3 in absorption) to confirm the general validity of the quantum predictions. In the case of diatomic molecules the spectrum consists of a series of almost equally spaced lines, as predicted by theory; but for polyatomic molecules the structure is more complex.

Bands due to a change of vibrational energy, with which a rotation change may also be associated, are of higher frequency and lie in the nearer infra-red, usually between 1μ and 10μ . Even here

FIG. 1.—ABSORPTION BAND OF HYDROGEN CHLORIDE IN THE INFRA-RED REGION

Heights of ordinates represent percentage of absorption

the experimental difficulties are still considerable, and adequate resolving power has only been obtainable in a very few cases (for diatomic molecules such as HCl). The kind of structure which is typical of this class of band is shown in fig. 1. The band as a whole originates in the absorption by non-vibrating molecules of sufficient energy to set up a one-quantum vibration. The structure is due to the fact that the molecules, originally in various rotation states, pass over to others simultaneously with the vibration change. The right-hand branch (known as the *R* branch) corresponds to an increase of unity in the rotational

quantum number and the left-hand (*P*) branch to a decrease of one unit in the rotational quantum. The number of lines in each branch thus indicates the number of different rotational states of the molecules, and the intensity distribution of the lines corresponds to the distribution of rotational energy among the molecules. Both characteristics vary with the temperature in accordance with the requirements of the kinetic theory of gases.

An important characteristic of such bands is the absence of a line at the centre, concerning which there has been a certain amount of controversy. This phenomenon is also found in the rotation structure of electronic bands, and is well illustrated in the Plate, No. 12, where the location of the missing ("null") line is indicated. It now appears that such a line, if it existed, would belong to another branch altogether and therefore could not occur without the other members. The branch in question, designated *Q*, corresponds to zero change of rotational quantum number, and is frequently absent, not only in vibration bands but also in the electronic type. The exact location of a vibration band, and also its intensity, is dependent upon the particular vibration transition concerned *e.g.*, $0 \rightarrow 1$, $0 \rightarrow 2$, $1 \rightarrow 2$, etc. The first is much the strongest under ordinary conditions, and it is very significant that the relation between the frequencies is not exactly integral, as it would be if the classical theory applied. The actual expression for the frequency of the n th harmonic is approximately of the form $n\omega(1-nx)$, where x is a small constant depending upon the law of force between the nuclei. It is to be noted that up to the present vibration and rotation bands have been observed only in absorption spectra.

Electronic Bands.—Turning now to electronic bands, which lie mainly in the visible and ultra-violet regions, we find a much greater complexity of structure, but on the other hand the experimental technique available is much more highly developed, so that a great wealth of data has been accumulated, the interpretation of which has reached a fairly advanced stage. We have here to do with a simultaneous change in electronic, vibrational and rotational energy, and each makes its own individual and characteristic contribution to the structure of the spectrum. The electronic contribution is the largest and determines, broadly speaking, the location of the band system. It may be represented as the difference of two terms to which the designations *S*, *P*, *D*, etc., may be attached, and which may have multiple values, just as for atomic spectral terms. The chief difference between the two cases appears to be that transitions such as $S \rightarrow S$ and $P \rightarrow P$, which are "forbidden" for atoms, may occur in molecules. But the total number of electron transitions which actually occur is fortunately much less than in atoms.

With a given electron transition is associated a variety of vibration and rotation changes, which are reflected in the spectrum as a coarse and a fine structure respectively. Postponing for the moment any detailed description of these, we may note that for diatomic molecules the structure is capable in both cases of being represented by an expression of the type $A + Bn + Cn^2 + \dots$, the higher terms being usually negligible. In the case of rotation the coefficient *B* gives the moment of inertia ($B = h^2/4\pi^2 I$) and *C* is determined by the change in the moment of inertia due to the transition. The moment of inertia can thus be evaluated if the values of *n* are correctly assigned, and if the constitution of the molecule is known the separation of the nuclei then follows. In the case of vibration the coefficient *B* gives the vibration frequency for small amplitudes, and *C* the variation of frequency with amplitude. If the vibrations were simple harmonic, *B* would give the force per unit displacement and *C* would be zero. This is never the case however, nor, indeed, is it to be expected on any obvious molecular model, but from the values of *B* and *C* it is possible to determine the amplitude of the vibrations and the law of force, that is to say, the manner in which the force varies with the nuclear separation, in the neighbourhood of the equilibrium position. A typical example of vibration structure is represented in fig. 2, which shows on a scale of wave-numbers the arrangement of the chief band heads of the violet cyanogen system. It will be seen that they group themselves in sequences for each of which the change Δn of vibrational quantum number

is the same. As each band comprises a large number of lines (several hundred in this case) there is a great deal of overlapping in one sequence. The larger the moment of inertia the more numerous and closely packed are the lines of one band, so that it eventually becomes impossible to analyse the structure. Nevertheless, the analysis has been carried out more or less completely for more than a hundred band systems already, and various general conclusions of interest have emerged.

Molecular Structure.—One of the most striking of these conclusions is the small range of variation in the nuclear separation for the 60 or so diatomic molecules concerned. For practically all of them it lies between 1 and 2 A.U. (10^{-8} cm.). For molecules of similar structure, *e.g.*, the hydrides, it exhibits a regular progression, decreasing as the atomic number increases, and increasing suddenly at the beginning of each new period, when the formation of a new electron shell is begun. The vibration frequency shows larger variations (of the order of 100 to 4,000 cm^{-1} [in practice the wave-number in cm^{-1} , *i.e.*, the reciprocal of the wave-length, is used instead of the actual frequency, this may be obtained from the wave-number by multiplying by 3×10^{10}]) which are generally in the inverse sense. By considering both of these features in relation to an assumed force function some indication of the nature of the binding can be deduced. This may be classified as:—(1) polar, in which two oppositely charged ions are bound by electro-static attraction varying nearly inversely as the square of their distance apart (*e.g.*, HCl, OH, CuH, ZnH, etc.); (2) due to electron sharing, in which some electrons from each atom form a common shell (*e.g.*, CO, NO, CN, etc.); (3) due (probably) to mutual polarisation of the atoms, each retaining its own electron system (*e.g.*, I_2 and perhaps some other elementary molecules).

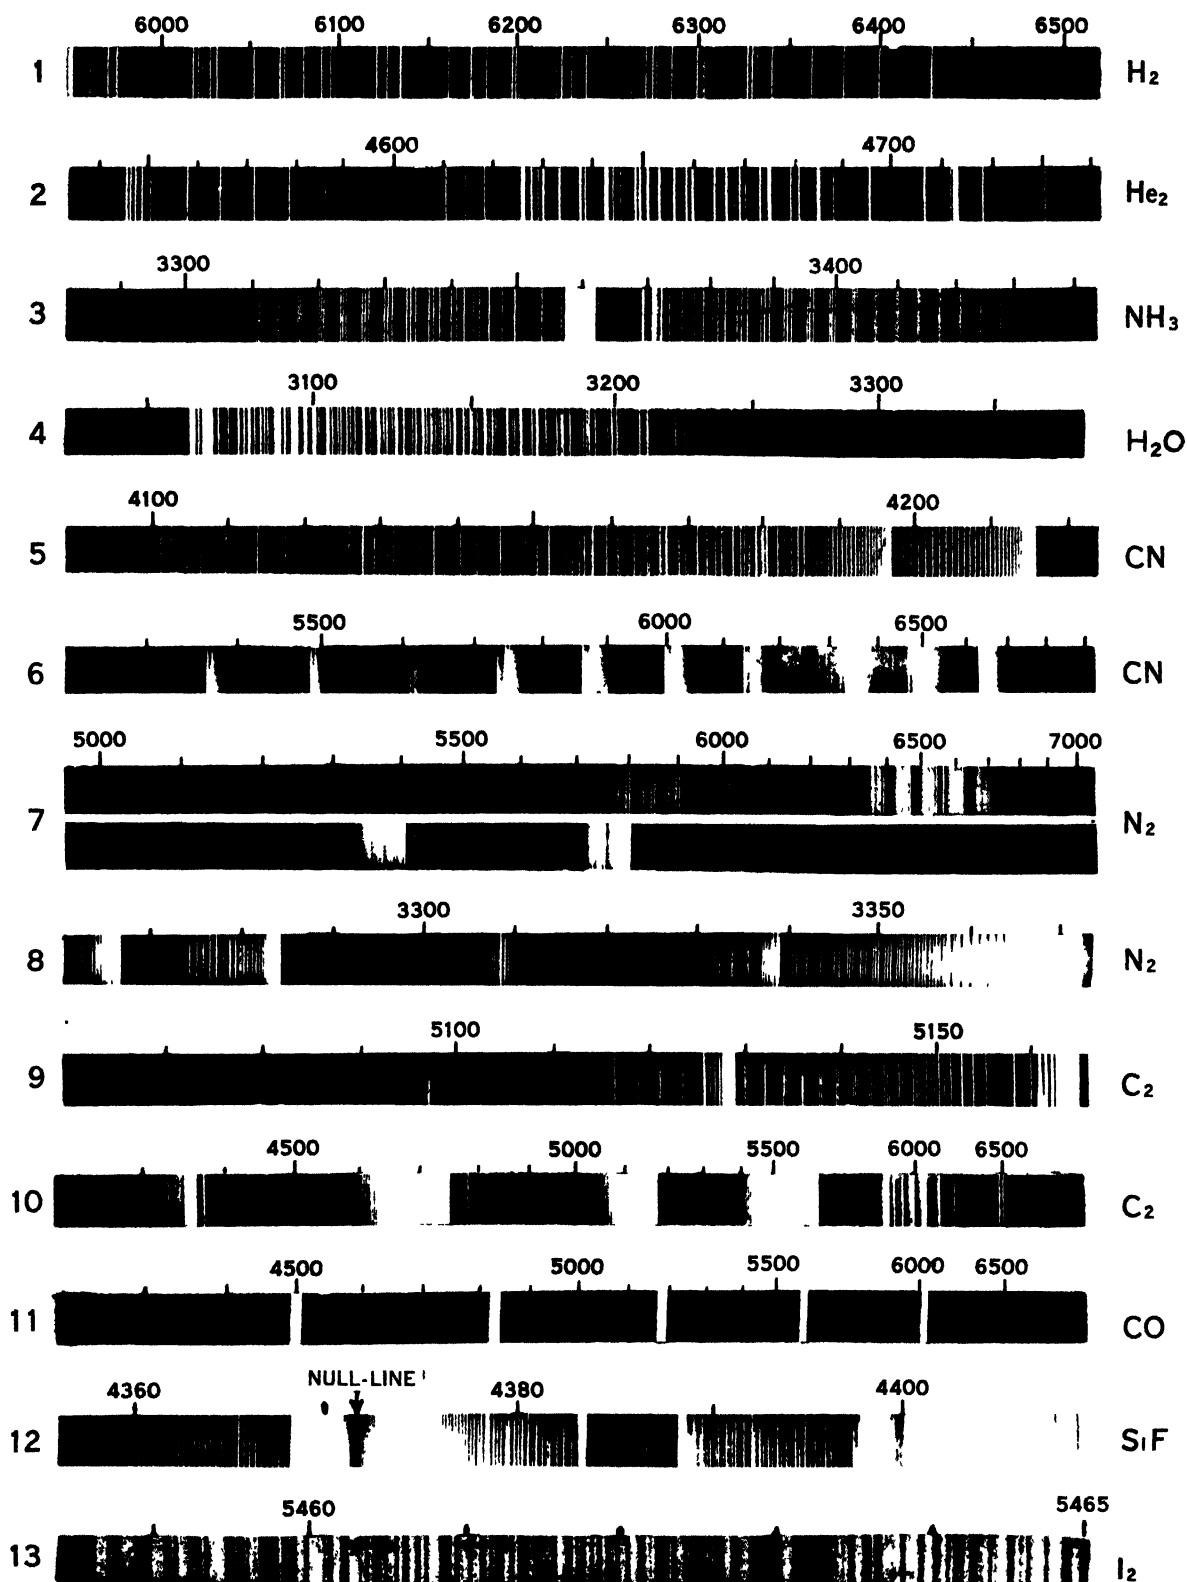

Fluorescence of Molecular Vapours.—There is one special case of band emission which calls for notice, both on account of the interesting nature of the phenomenon and of the simplicity of the theoretical explanation. This is the fluorescence of certain elements in the state of vapour (*e.g.*, S, Se, Te, I) as excited by monochromatic radiation. If iodine vapour, for example, is excited by a wave-length corresponding to one of the lines in its very complex absorption spectrum (*see* Plate), it is found that the fluorescent light emitted consists of a regular series of doublets, the origin of which may be indicated most conveniently by an actual example. The mercury line $\lambda 5461$ happens to coincide with an iodine absorption line due to the transition (0, 34) to (26, 35), where the first figure in the bracket refers to the vibration and the second to the rotation state. There is an electron transition as well, but this need not be considered for our present purpose. The excited molecule (26, 35) then emits radiation, but does not necessarily re-emit in one process the whole of the energy previously absorbed. If it should do so it will of course emit the original line, but it may alternatively return to the state (0, 36), giving out a line of slightly different wave-length. There are many other final states possible, such as (1, 34) or (1, 36), (2, 34) or (2, 36), and so on. Each pair gives rise to a doublet, and the doublets themselves form a series of approximately constant wave-number interval. Further, the comparison of accurate wave-length data with the theoretical expressions permits an evaluation of the molecular constants, thus evading the difficulty, hitherto insurmountable, of completely analysing the absorption spectrum. (*See* FLUORESCENCE and PHOSPHORESCENCE.)

Rotation Structure of Bands.—We proceed now to the more detailed consideration of electronic bands due to emission by diatomic molecules. A single band of this type arises from a variety of rotation changes associated with a particular electron and vibration transition. The contribution of these to the radiated frequency may thus be regarded as constant, *v*, say. By applying the usual quantum restriction to the rotational motion and making use of Bohr's Correspondence Principle (*see* LINE SPECTRA), we find that a molecule in the m 'th rotational state is capable of emitting one of three different frequencies, namely:

$$\begin{aligned} \text{due to } m \rightarrow m-1, \quad v &= v_0 - B/2 + Bm + Cm^2 \\ \text{,, } m \rightarrow m, \quad v &= v_0 + Cm^2 \\ \text{,, } m \rightarrow m+1, \quad v &= v_0 - B/2 - Bm + Cm^2 \end{aligned}$$

BAND SPECTRUM

PLATE

BY COURTESY OF (1 TO 12) THE ROYAL SOCIETY, (13) BY PERMISSION OF THE COLUMBIA UNIVERSITY PRESS

BAND SPECTRA OF VARIOUS CLASSIFICATIONS

WAVE LENGTH SCALES ARE IN ÅNGSTRÖM UNITS (1 Å U = 10^{-10} METRE). THE MOLECULES TO WHICH THE SPECTRA ARE ATTRIBUTED ARE INDICATED ON THE RIGHT.

1. H_2 , secondary spectrum of hydrogen. 2. He_2 , band spectrum of helium. 3. NH_3 , the "ammonia" band. 4. H_2O , the "water-vapour" band. 5. CN , part of violet band system of cyanogen. 6. CN , part of red band system of cyanogen. 7. N_2 , "first positive" system of nitrogen bands. Spectrum of "active nitrogen." 8. N_2 , "second positive" system of nitrogen. 9. C_2 , "Swan" band of carbon or hydrocarbon. 10. C_2 , "Swan" spectrum. 11. CO , "Angstrom" bands of carbon monoxide. 12. SiF , bands of silicon fluoride. 13. I_2 , absorption spectrum of iodine.

These are designated $R(m-1)$, $Q(m)$ and $P(m+1)$ in the notation which is most commonly used at present. The appearance of such a band is represented diagrammatically in fig. 3, but it should be noted that m has been given half-integral values since this is most frequently the case in practice. The Q branch is often absent.

Either the P or the R branch may run to a head, according to whether C is positive or negative. The former is the case when the moment of inertia increases as a result of emission, and vice versa. But the position, or even the existence of a head, is of no immediate physical significance, for it is simply determined by the relative values of B and C . The band may fade out before the head is reached, as in He_2 , or the head may be so close to ν_0 that it is not recognizable by the crowding together of the lines, so that the band appears to be headless, as in I_2 .

The rotation terms, from which the molecular constants are calculated, are evaluated as follows. For brevity we may write:

$$\left. \begin{aligned} P(m) &= \nu_0 + F'(m-1) - F''(m) \\ Q(m) &= \nu_0 + F'(m) - F''(m) \\ R(m) &= \nu_0 + F'(m+1) - F''(m) \end{aligned} \right\} \begin{array}{l} \text{where } F' \text{ refers to the state} \\ \text{of higher electronic excitation and } F'' \text{ to the lower,} \end{array}$$

whence $Q(m) - P(m) = R(m-1) - Q(m-1) = F'(m) - F'(m-1)$

and $Q(m) - P(m+1) = R(m) - Q(m+1) = F''(m+1) - F''(m)$.

These relations serve at once to fix the relative numeration of the branches and to isolate the initial and final term differences, from which the actual term values can readily be obtained. A similar procedure can be followed even if the Q branch is absent.

The intensity distribution in all three branches is similar, showing an increase with m up to a maximum and then a more gradual decrease to zero. The position of the maximum shifts to higher m values with increasing temperature in agreement with the Maxwell-Boltzmann law of distribution of rotational energy amongst the molecules. In practice it rarely happens that the branches are single; doublets are quite common, and higher multiplicities, up to fivefold, have been recorded. Nor are the simple expressions given above usually adequate for the accurate representation of band branches. It is necessary to modify them on account of several disturbing factors, e.g., the distortion of the molecule due to rotation and vibration. Further terms, in m^4 and m^6 , must be introduced in the rotation term values, and the value of B adjusted according to the particular state of vibration. With such a corrected formula a very accurate representation can usually be achieved, and it is then possible to calculate the vibration frequency solely from observations of the rotation structure.

Vibration Structure of Bands.—In order to account for the vibration structure it is necessary to express the vibrational energy in terms of the quantum number n ; the expression which is usually employed is $an - bn^2$, where a is the vibration frequency for negligibly small amplitudes and b expresses the departure from simple harmonic motion. The vibration structure is then determined by the range of possible values for n' , n'' and $n' - n''$ (n' and n'' refer to the upper and lower electronic levels respectively). This varies greatly in different molecules; in some (e.g., CaH , He_2) vibration is almost, if not entirely, precluded owing to instability of the molecule, whilst in others a fairly long series of vibration states is developed (e.g., I_2 , with n' up to 59). The observed vibration transitions, $n' - n''$, show a correspondence with the change in the moment of inertia, $I' - I''$, that is to say, relatively high values of the two tend to occur together. Franck has pointed out that this is to be expected, since a sudden change of size of the molecule must disturb the equilibrium of the nuclei and set up a vibration which is more intense the greater the change. We find a particularly clear example of this in the absorption spectra of I_2 , Br_2 and Cl_2 in the visible region. In all three cases $I' - I''$ is exceptionally large compared with other molecules. In the case of the non-vibrating molecule of I_2 the electron transition sets up a vibration of at least 18 units, and the earlier portion of the $n'' = 0$ progression, for which $n' < 18$, is therefore entirely absent. Br_2 shows a similar peculiarity, whilst in the case of Cl_2 the change is apparently so great that dissociation occurs, giving continuous instead of banded absorption, and the first observed absorption band therefore corresponds to $n'' = 1$ instead of $n'' = 0$

as in the other two cases. Incidentally, this explains why the banded absorption is relatively so weak in Cl_2 , for at ordinary temperatures the majority of the molecules are in the vibrationless state and so give rise only to continuous absorption. The appearance of the spectrum is also much influenced by the relative values of σ' and σ'' . If they do not differ much the bands forming a sequence, for which $(n' - n'') = \text{constant}$, lie fairly close together, as in CN (see fig. 2 also Plate, Nos. 5 and 10), but if $\sigma' - \sigma''$ is large, as in the halogens, the sequences are widely spaced and frequently are intermingled with one another, so that the vibrational structure is much less apparent. (See Plate, No. 13.)

Since the molecular vibration frequency is directly dependent upon the masses of the nuclei we should expect the vibration

FIG. 2.—ILLUSTRATING VIBRATION STRUCTURE IN AN ELECTRONIC BAND SPECTRUM

structure to furnish evidence as to the existence of isotopes (*q.v.*), and this is, in fact, the case. The matter has been thoroughly investigated, both theoretically and experimentally, by Mulliken, with completely satisfactory results. It is found that the bands due to the different isotopic combinations are separated by an amount proportional to their distance from the origin of the system, and accurate measurements of the effect have proved of service in resolving uncertainties as to the identity of the emitting molecule. It is quite possible that intensity measurements might be utilized to determine the relative abundance of the isotopes.

Electronic Configuration of Molecules.—There remains to be considered the electronic energy change involved in the emission or absorption of a band spectrum. As already mentioned, the electronic terms are generally similar to those of atoms, but only in H_2 and He_2 has the existence of well-developed Rydberg sequences been established. Some striking similarities, as regards multiplicities and term values, have, however, been recognized between certain molecular electronic levels and those of "corresponding" atoms. For example, the electron levels of the molecules BeF , BO , CO^+ , N_2^+ and CN , which all have nine outer electrons if it is assumed that the K shells of the constituent atoms remain intact, exhibit a certain similarity to those of Na , which also has nine electrons outside the K ring. This suggests that, as in Na , there is one electron less firmly bound than the other eight, and the analogy is supported by the resemblance which is traceable between CO , N_2 and Mg (ten outer electrons) and between O_2^+ , NO and Al (11 outer electrons). The matter must still be regarded as *sub judice*, however, as Mecke has brought forward evidence which appears to conflict with the above view. It seems clear, in any case, that in these molecules there must be some sort of common shell, which is concerned with the binding of the nuclei but not directly with the emission. There are also molecules (Cu halides, He_2) in which the radiating electron appears to be linked with one of the constituent atoms instead of with the molecule as a whole. (See fig. 3.)

Absorption Band Spectra.—Although emission band spectra have been much more extensively studied, band spectra which can be obtained in absorption are of particular interest and importance, for several reasons. The identity of the absorbing molecule is definitely known, whereas in emission there is frequently

much uncertainty, which can thus be removed if any of the same levels can be recognized in both spectra. Further, absorption spectra are in general much less complex than emission, since the only initial levels are those normally present in the unexcited vapour, whereas in emission the initial levels refer to excited states and are therefore much more numerous. These absorption spectra, however, lie mostly, apart from the halogens, in the far ultraviolet

FIG. 3.—ILLUSTRATING ROTATION STRUCTURE IN AN ELECTRONIC BAND SPECTRUM

Heights of ordinates represent intensities. Both Q and P branches run to a head. The returning portion of the P branch is shown on the lowest line

(Schumann) region, and have therefore only recently been investigated. Unfortunately it is not possible to obtain an absorption spectrum corresponding to every emission spectrum, since the substance concerned may not be obtainable in the vapour state under conditions suitable for the examination of its absorption spectrum. Indeed, many of the band spectra to which reference has here been made are due to very unstable molecules (OH, Hc, the metallic hydrides) which have only a transitory existence under the special conditions obtaining in a discharge tube. The spectra of even the common chemical molecules consisting of more than two atoms are still practically unknown.

See E. C. C. Baly, *Spectroscopy* (3rd ed., vol. iii., 1927); "Molecular Spectra in Gases," *Bulletin No. 57 of the National Research Council*, 1927).

BANDUNG, capital of the Mid-Preanger residency, Java, Dutch East Indies, the third largest city in Netherlands India. Pop. (1926) 170,498, (16,057 Europeans and Eurasians, 141,540 natives and 12,901 foreign Asiatics, including Chinese). In 1906 it had less than 50,000 inhabitants. It is situated on a plateau in Preanger, 2,346ft. above sea, surrounded by heights of 5,000 to 7,500 ft., and has a delightfully cool, healthful, malaria-free climate. It is quite one of the modern model cities of the world. It has cheap electric light and power, a telephone system, hard-surfaced, wide, tree-lined streets and roads; and shops, business premises, banks, official buildings and private residences the equal of many in Europe, together with several churches, and first-class hotels, clubs, two hospitals, restaurants, markets, three parks, a theatre, several cinemas, and a race-course. Distant from Batavia (109 miles), by rail just under three hours, it has recently become headquarters of the Departments of War, Public Works, and Public Industries, including post, telegraph and telephone services, mines service, salt monopoly, State rail and tramways, electricity and water-power. Bandung has a technical and several other high schools, including one for the sons of nobles, a Government Vaccination Institution and a Pasteur Institute, a hospital for eye diseases and an institute for the blind, a training school for native teachers, also one for training native officials, the largest quinine factory in Java, State railway workshops, several large factories, and an extensive artillery construction establishment. The Resident's house is a handsome building, also the official residence of the native Regent, and President of the Regency Council. There is a fine large mosque, and in the Lembang highlands, not far away, an important astronomical observatory, the Bosscha Observatory. On the neighbouring Pengalengan plateau the famous Malabar radio station—the most powerful wireless station in the world—stands at a height of 4,400ft.

Founded, practically, by Marshal Daendels, in 1810, Bandung was little more than a large village until, in 1884, the government

railway was brought to it—from Buitenzorg, over Sukabumi and Chandjur. To-day it is looked upon as the capital of the whole of the Sundanese country, it is a health resort for the coastal people, and, during race week, the centre of fashion, when European and native (particularly Sundanese) life may be seen at its gayest. In the neighbourhood of Bandung there is charming mountain scenery, including several waterfalls, the most beautiful those of the Chi Burum, amid the luxuriant jungle of Pengalengan, the Chi Sarua, and the Chi Tarum, where the water rushes through a narrow gully to dash down from the Bandung plateau.

Bandung is connected by rail with practically all Java, is so centrally situated, has such a wealth of electrical power in its waterfalls, and such an ideal climate, that a great future must lie before it.

(E. E. L.)

BANDURRIA, a Spanish musical instrument of the guitar family having from three to six strings plucked by a plectrum. The bandurria is not to be confused with the pandura, an ancient oriental instrument of the lute type, from which, as also from the mandoline, it differs essentially inasmuch as its back is flat, not vaulted. In England the bandurria, or a very similar instrument, was known as a bandoer or bandora.

BANEERRY or **HERB CHRISTOPHER**, popular names for *Actaea spicata* (family *Ranunculaceae*) a poisonous herb with long-stalked compound leaves, small white flowers, and black berries, found wild in copses in limestone districts in the north of England. It is widely distributed in the north temperate zone.

BANÉR (BANNER, BANIER), **JOHAN** (1596–1641), Swedish general in the Thirty Years' War, was born at Djursholm Castle on June 23, 1596. As one of the chief subordinates of Gustavus Adolphus, Banér served in the campaign of north Germany (1630), and at the first battle of Breitenfeld he led the right wing of Swedish horse. When Gustavus marched towards Lützen, his general was left in command in the west, where he was opposed to the imperial general Aldringer. In 1634, as a Swedish field-marshal, Banér, with 16,000 men, entered Bohemia, and, combined with the Saxon army, marched on Prague. But the complete defeat of Bernhard of Saxe-Weimar in the first battle of Nördlingen stopped his victorious advance. After this event the peace of Prague placed the Swedish army in a very precarious position, but the victories won by the united forces of Banér, Wrangel and Torstensson, at Kyritz and Wittstock Oct. 4, 1636, restored the paramount influence of Sweden in central Germany. Even the three combined armies, however, were decidedly inferior in force to those they defeated, and in 1637 Banér was completely unable to make headway against the enemy. Rescuing with great difficulty the beleaguered garrison of Torgau, he retreated beyond the Oder into Pomerania. In 1639, however, he again overran northern Germany, defeated the Saxons at Chemnitz and invaded Bohemia itself. The winter of 1640–41 Banér spent in the west. His last achievement was an audacious *coup de main* on the Danube. Breaking camp in mid-winter (a very rare event in the 17th century) he united with the French under the comte de Guébriant and surprised Regensburg, where the diet was sitting. Only the break-up of the ice prevented the capture of the place. Banér thereupon had to retreat to Halberstadt. Here, on May 10, 1641, he died, after designating Torstensson as his successor. He was much beloved by his men, who bore his body with them on the field of Wölfenbittel. Banér was regarded as the best of Gustavus's generals, and tempting offers (which he refused) were made him by the emperor to induce him to enter his service. See also THIRTY YEARS' WAR.

See Lundblad, *Johan Banér* (1823); Ardwisson, *Tritioariga Krigets märkvaerdigaste personer* (1861); B. P. von Chemnitz, *Königlichen Schwedischer in Deutschland geführten Kriegs*; Martin Veibull, *Sveriges Storhedstied* (1881); *Banér's Bref till Axel Oxenstierna* (1893).

BANERJEA, SIR SURENDRANATH (1848–1925), Indian (Brahman) politician and journalist. Passing for the Indian Civil Service at the open competition of 1870, he retired after two years' service, and opened a small school in Calcutta, which expanded into Ripon College. In 1876 he founded the Calcutta Indian Association, and three years later he became editor

of *The Bengalee* newspaper. He was one of those who established the Indian National Congress in 1883; he presided over the Poona session of 1895 and again at the meeting at Ahmadabad in 1902.

In 1893 Banerjee was elected to represent the Calcutta corporation on the Bengal Legislative Council, and was twice returned to the central Legislature as member for Bengal. Vehemently opposing the administrative partition of Bengal effected by Lord Curzon in 1905, he supported the boycott of foreign goods. But he preferred constitutional methods, and welcomed the Montagu-Chelmsford reforms. Severing his association with the congress, which had passed under "extremist" control, he formed an "Indian Liberal" organization, and accepted office as minister for local government and sanitation in Bengal. A knighthood was conferred upon him in Jan. 1921, and in 1924 he retired into private life. Shortly before his death he published his autobiography, *A Nation in Making*.

BANFF, royal, municipal and police burgh, seaport and capital of Banffshire, Scotland. Pop. (1921) 3,517. It is beautifully situated on high ground, on the left bank of the mouth of the Deveron, 50m. north-west of Aberdeen by the L.N.E. railway. Its first charter was granted by Malcolm IV. in 1163, and further privileges were conferred by Robert Bruce in 1324 and Robert II. in 1372. A castle was built (1750) on the site of an old one near the sea where Archbishop Sharp was born. Leather, rope and sails are made, and there are a distillery, an iron foundry and timber-yards, besides some shipbuilding. The fishing trade is also important. The burgh is under provost and council. Alexander Cassie of London, a native of Banff, left £20,000 to the poor of the town. Duff House, a seat of the duke of Fife, was built in 1740-45, after designs by Robert Adam and contains a fine collection of pictures and an interesting armoury. The house, with about 140 acres of park, was presented to the towns of Banff and Macduff (on the opposite side of the Deveron) by the duke of Fife in 1906. The house is used as a sanatorium.

BANFF GRAND CANYON ROAD extends from Banff, Alberta, Canada, to Grand Canyon, Arizona, and is 1,450m. long with 230m. in Canada. Beginning near Lake Louise and ending at Grand Canyon, this route traverses a region of scenic wonders.

BANFFSHIRE, north-eastern county of Scotland, bounded on the north by Moray firth, east and south by Aberdeenshire, and west by Elgin and Inverness. Area 403,053 acres, or 630 square miles. The north is fine, open and undulating, with rich, highly cultivated soil. The south is mountainous with extensive farms in fertile glens. Some mountains are forested, some present rock and copse, others brown heath. The highest is Cairngorm, on the confines of Banff and Inverness (4,084ft.), famous for amber-coloured quartz crystals, the "cairngorms" of Scottish jewellery. This and other summits belong to the most extensive of several masses of granite found, with other igneous intrusions, among the crystalline schists of sedimentary origin of the eastern highland sequence which cover most of the county. These sedimentary rocks form belts trending generally north-east and south-west, and include slates and black schists, the main limestone and the quartzites. The last, probably the highest members of the series, form ridges owing to more rapid erosions of softer rocks between them. No great rivers belong wholly to Banffshire. For a considerable part of their course the Spey forms the western and the Deveron the eastern boundary. The short Banffshire streams are Avon (or Aven), Fiddich, Isla, Buckie, Deckford (with a series of cascades), and Livet. Most of them are stocked with trout, and the Spey

and Deveron are famous for their salmon. The fine glens include Glen Aven, Glen Barry, Glen Fiddich, Glen Isla, Glen Livet and Glen Rinnes. The largest lochs are in the extreme south.

Cairns are found in the districts of Rothiemay, Ballindalloch, Boharm, Glen Livet and elsewhere. "Cairn" also occurs in many place names. Many conflicts took place between Norse invaders and the Scots. Near Cullen a fierce encounter occurred in 960, and a sculptured stone at Mortlach is said to commemorate a signal victory gained by Malcolm II. over the Norsemen in 1010. The shire was the scene of much strife after the Reformation. In Glen Livet the Roman Catholics under the marquess of Huntly worsted the Protestants under the earl of Argyll. From 1624 to 1645 was a period of almost incessant struggle; Covenanted troubles combined with the frequent conflicts of the clans; but the Jacobite risings of 1715 and 1745 left the county comparatively untouched, and thereafter it became settled.

The population of Banffshire in 1911 was 61,402 and in 1921 57,293. In 1921 there were 258 persons speaking Gaelic and English. The chief towns are Banff (pop. in 1921 3,517), Buckie (8,690), Keith (4,270) and Macduff (3,345). Banffshire, with Aberdeen and Kincardine shires, forms a sheriffdom, and there is a resident sheriff-substitute at Banff, who sits also at Keith and Buckie. A notable incident in the history of education in Banffshire was the bequest of James Dick (1743-1828), a West Indian merchant, who left over £110,000 to promote the higher learning of the schoolmasters of this county, Aberdeenshire, and Elginshire, the income to be distributed among dominies qualified by examination to become beneficiaries.

The soil is in general rich and productive, yielding fair crops of wheat, and excellent crops of barley, oats, etc., and the grass and green crops (especially turnips) are equally abundant. Oats is the predominant crop, but the demands of distillers keep up the acreage of barley. Cattle and stock form the staple agricultural industry. There is also a considerable amount of dairy farming. Among landlords who did much to encourage agricultural enterprise and so to plant and reclaim lands were the earls of Fife and the earls of Findlater, afterwards earls of Seafield. It was a Seafield who, in 1846, received the honorary gold medal of the Highland and Agricultural Society of Scotland, for his immense and thriving plantations of useful trees, amounting in the preceding 35 years to nearly 32 millions, in the counties of Banff, Moray and Nairn.

Distilleries are numerous and famed. A fishing and miscellaneous trade is done at the harbours of Banff, Macduff, Buckie, Gardentown, Portsoy, Cullen and Port Gordon, and fishing is also carried on at numerous creeks or harbours. The cod and herring fisheries are specially important at Buckie. The fishery districts centre in Banff and Buckie. A good deal of boat-building is carried on at coast stations. The main limestone has been extensively quarried, as at Fordyce, near Grange, and at Keith and Dufftown, lime-burning is carried on, and the slates (for roofing) and the granite have also been worked.

The systems of the L.N.E. and the L.M.S. railways serve the chief towns of the county and provide communication in one direction with Aberdeen, and in another with Elgin, Nairn and Inverness.

BANFF-WINDERMERE HIGHWAY extends from Banff, Alberta, Canada, to Windermere in British Columbia, and is about 150m. in length. Opened in 1923, it was the first motor route built across the central Rockies through magnificent scenery. It forms a part of the

Trans-Canada highway which extends south to Cranbrook and connects with Spokane, Washington, U.S.A., and its course through Vermilion and Sinclair Passes is highly picturesque. Castle Mountain and Radium Hot Springs, which lie in its path, add to its scenic interest.

BÁNFFY, DEZSŐ (DESIDERIUS), BARON (1843-1911), Hungarian statesman, was born at Klausenburg on Oct. 28, 1843, and died in Budapest on May 24, 1911. As lord lieutenant of the county of Belső-Szolnok, chief captain of Kővár and curator of the Calvinistic church of Transylvania, Bánffy exercised influence outside parliament from 1875 onwards; but his public career may be said to have begun in 1892 when he became speaker of the house of deputies. As speaker he continued, however, to be a party-man (he had always been a member of the left-centre or government party) and materially assisted the government by his rulings. He was a stringent adversary of the radicals, and absented himself from the capital on the occasion of Kossuth's funeral on April 1, 1894. On Jan. 14, 1895, the king, after the fall of the Széll ministry, entrusted him with the formation of a cabinet. His programme, in brief, was the carrying through of the church reform laws with all due regard to clerical susceptibilities, and the maintenance of the Composition of 1867, whilst fully guaranteeing the predominance of Hungary. He succeeded in carrying the remaining ecclesiastical bills through the Upper House, a triumph which brought about the fall of Kalnóky, the minister for foreign affairs. In the ensuing elections of 1896 the government won a gigantic majority. The corrupt practices at this election were the pretext for the fierce opposition in the House which he henceforth had to encounter, though the measures which he now introduced (the Honved Officers' Schools Bill) would, in normal circumstances, have been received with general enthusiasm. Bánffy weathered these storms, and his subsequent negotiations with Austria as to the quota and commercial treaties, to the considerable political advantage of Hungary, even enabled him for a time to live at peace with the opposition. But in 1898 the opposition secured the dismissal of Bánffy, and passion ran so high that on Jan. 3, 1899, Bánffy fought a duel with his most bitter opponent, Horánszky. On Feb. 26 Bánffy resigned, to save the country from its "ex-lex," or unconstitutional situation; subsequently he contributed to overthrow the Stephen Tisza administration, and in May 1905 joined the Kossuth ministry.

See article, "Bánffy," by H. Marczali, in *Pallas Nagy Lexikona*, Köt. 17.

BANG, HERMANN JOACHIM (1858-1912), Danish author, was born of a noble family in the island of Zealand. When he was 20 he published two volumes of critical essays on the realistic movement. In 1880 he published his novel *Haabløse Slaegter* ("Families without hope"). He settled in Copenhagen, and produced a series of novels and collections of short stories, which placed him in the front rank of Scandinavian novelists.

Among his more famous stories are *Faëdra* (1883) and *Time* (1889). The latter won for its author the friendship of Ibsen and the enthusiastic admiration of Jonas Lie. He died on Jan. 29, 1912.

His works include: *Det hvide Hus* (The White House, 1898), *Excentriske Noveller* (1885), *Stille Eksistenser* (1886), *Liv og Dod* (Life and Death, 1899), *Englen Michael* (1902), a volume of poems (1889), recollections (*Ti Aar*, 1891), a volume of essays, *Masker og Mennesker* (1910). His works were collected and published in six volumes (Copenhageh and Oslo, 1912). See F. Poppenberg, *Hermann Bang* (1904).

BANG, NINA HENRIETTE WENDELIN (1866-1928), Danish politician, was born at Copenhagen, where, in 1894, she graduated M.A. She married a politician, Gustav Bang, who died in the year 1915. Devoting herself to economic studies, she was active as a Social Democrat in politics and journalism, and in 1918 became a member of the Landsting (Upper House). In 1924 she joined the first Danish Social Democratic Government under Theodore Stauning as Minister of Education thus becoming the first woman cabinet minister in the world. With the support of Danish and foreign scientific funds Mrs. Bang commenced, in 1906, the publication of a comprehensive work

about the dues on the Sound, *Tables of Shipping and Goods Transport on the Sound, 1497-1660* (1906-22). She died in Copenhagen March 25, 1928.

BANGALORE, a city of India, the capital of the native State of Mysore, and the largest British cantonment in the south of India. It is 3,113 ft. above sea-level, and 219 m. W. of Madras by rail. Pop. (1921) 118,556, was nearly double that of 1901. This rapid increase is due to the development of industry and commerce. The foundation of the present fort was laid by a husbandman who, probably in the 16th century, left his native village and settled a few miles to the north of Bangalore, which he conquered. Later, Bangalore was in the possession of Shahji, father of Sivaji, the founder of the Mahratta sway, and then of his son, who sold it to the raja of Mysore in 1687. In 1758 Bangalore was granted as a *jagir* or fief to Hyder Ali; afterwards usurper of Mysore, who greatly enlarged and strengthened the fort, which on his expulsion from Seringapatam in 1760, served as his refuge.

In 1791 the fort was stormed by a British army commanded by Lord Cornwallis, and in 1799 the district was included by the Treaty of Seringapatam within the territory of the restored raja of Mysore. It formed the headquarters of the British administration of Mysore from 1831 to 1881. When the State of Mysore was restored to its raja in 1881, the civil and military station of Bangalore was permanently reserved under British jurisdiction as an "assigned tract." It has an area of 138 sq. m., and had in 1921 a population of 118,940. Bangalore is the headquarters of a military district, its elevation rendering it healthy for British troops. A considerable number of European pensioners reside here, and there are many visitors in the season. There is a modern palace for the maharaja and a fine Indian institute of science. Bangalore is an important railway centre. There are oil, cotton, wool and silk mills, brick and iron works, a distillery and a tobacco factory. Suburbs have been built recently outside the city, owing to the prevalence of plague, but the poorer quarters are overcrowded. There is a good water supply, drainage and electric light.

The District of Bangalore borders on the Madras district of Salem. The main portion consists of the valley of the Arkavati river, which joins the Cauvery on the southern frontier. Its area is 3,068 sq. m. Pop. (1921) 788,379.

BANGANAPALLE, a State of southern India, surrounded by the Madras district of Kurnool. Area, 255 sq. m.; pop. (1921) 36,692; no tribute and no army. The late nawab was temporarily removed from his position in 1905 owing to the inefficiency and excessive expenditure of the administration. The present nawab is Meer Fazole Ali Khan Badahur. The town of Banganapalle is 17 m. from the branch of the Southern Mahratta railway from Guntakal to Bezvada. There are diamond mines near the town, and ghee, fruit, lacquer and skins are exported.

BANGASH, a Pathan tribe in the Kohat district of the North-West Frontier Province of India.

See H. A. Rose, *Tribes and Castes of the Punjab and North-West Frontier Province* (1911).

BANGKOK, the capital of Siam, on the river Me Nam, about 20 m. from its mouth. Until modern times the city was built largely on floating pontoons or on piles along innumerable canals and water-courses which formed the thoroughfares; in recent years, however, well-planned roads and streets have been constructed, crossing the old canals at many points, and lined with well-built houses, for the most part of brick. The centre of the city is the royal palace (*see SIAM*), situated in a bend of the river and enclosed by walls. At a radius of nearly a mile was another wall (whole sections of which together with the inner wall have been demolished) within which lay the closely-packed city proper, and beyond which the town stretched away to the royal parks on the north and to the business quarter, the warehouses, rice-mills, harbour and docks on the south. There are about 80 rice-mills in or near the city and a naval arsenal, while the Bangkok Dock Co. have two graving docks besides slipways for launches up to 76 ft. The whole town covers an area of over 108 sq. m. There is a complete system of electric tramways and the streets are lined with shade-trees and lit by electricity. All over the town are scattered

Buddhist temples, with coloured tile roofs and gilded spires. Many fine buildings are to be seen—public offices, the arsenal, the mint, palaces, the Chulalongkorn university, schools, hospitals, markets and Christian churches, chiefly Roman Catholic. There are four railway stations in Bangkok, the termini of the lines which connect the capital with the provinces and with Penang and Singapore.

The climate of Bangkok has, in recent times, become hotter and less humid. Though a minimum temperature below 60°F is still recorded in January and December, a maximum of over 100° is reached during the hot months and at the beginning of the rains, whereas up to 1900 a maximum of 93° was considered unusually high. The cause of this change is attributed to extensive drainage and removal of vegetation in the immediate neighbourhood of the town. The annual rainfall amounts to over 50in.

A four-mile reach of the Me Nam, immediately below the city proper, forms the port. From 250 to 400yds. broad and of good depth right up to the banks, the river offers every convenience for the berthing and loading of ships, though a bar at its mouth, which prevents the passage of vessels drawing more than 13ft., necessitates, in the case of large ships, a partial loading and unloading from lighters outside. The banks of the port are closely lined with the offices, warehouses and wharves of commercial houses, with timber yards and rice-mills; the custom house, the harbour master's office and many of the foreign legations and consulates are also situated here. It is notable that the heavy trade with Singapore shows a tendency to decrease in favour of direct trade with Europe. A fleet of small steamers, schooners and junks, carries on trade with towns and districts on the coasts of the Gulf of Siam. The trade of Bangkok is almost entirely in the hands of Europeans and Chinese. The principal exports are rice and teak, and the principal imports, cotton and silk goods and gold-leaf. Trade is flourishing and 85% of it goes through the capital, in 1925-26 the total foreign trade of the port being £33,040,159, of which imports accounted for £14,888,643 and exports £18,151,516. Most of the leading mercantile firms and banks of the Far East have branches in Bangkok and a number of Chinese banks also have headquarters here. The unit of currency is the *tical*, or *bakt* (see SIAM).

The government of Bangkok, carried on directly by the Central Government, is administered by the lord prefect, who is an official of the Ministry of the Interior. Under him are the gendarmerie, municipal affairs, harbour, public health and prison departments. The police force is an efficient and well-organized body of 8,000 men under a commissioner of police (non-European). The harbour master general controls the port and the city waterways. Local revenues are collected by the revenue office. The functions of the department of municipal affairs include responsibility for conservancy and the water-works of Bangkok, which are under the direct supervision of the city engineer. The absence of good drinking water was, until recently, largely responsible for the bad sanitary conditions of the city and resulted in a high death rate, especially among children, from cholera, smallpox and fevers during the dry months. Now that the water supply, taken from the river above the city, is purified and regularly examined, public health is greatly improved. A medical officer is in charge of sanitary inspection, vital statistics, control of communicable diseases, the central hospital, public health centres and prison medical service. The law courts are under the Ministry of Justice but until the promulgation and putting into force of the Siamese Penal, Civil and Commercial Codes and the Codes of Procedure and Law of Organization of Courts, and for five years after, the diplomatic and consular officials of the treaty powers may, by means of a written requisition addressed to the judge, evoke any case pending in a Siamese court, except the Supreme or Dika court, in which a subject, corporation, company or association or a protected person of the power is defendant or accused.

The population in 1924 was rather over 452,000; Siamese and Chinese form the majority, but there are members of almost every race to be found between Bombay and Japan, while Europeans number 1,500.

Before 1769 Bangkok was nothing but an agricultural village with a fort on the river bank. It was, in that year, seized by Paya Tak, as a convenient point from which to attack the Burmese army then in occupation of Siam, and upon his becoming king was made the capital. (See SIAM.)

BANGOR, borough of Co. Down, Northern Ireland, on the south side of Belfast Lough, 12m. E.N.E. of Belfast, on a branch of the Belfast and County Down railway. Pop. (1921) 7,776. It carries on a considerable trade in cotton and linen and embroidered muslin. It is greatly frequented as a watering-place, especially by the people of Belfast. Slight remains are to be seen of an abbey of Canons Regular, founded in the middle of the 6th century by St. Comgall, and rebuilt by St. Malachy O'Morgair in the 12th century. Bangor was incorporated by James I. and returned two members to the Irish parliament.

BANGOR (formerly Bangor Fawr, as distinguished from several other towns of this name in Wales, Ireland and Brittany), cathedral city and municipal borough of Carnarvonshire, North Wales, population (1921) 11,029. It is situated at the northern entrance to the Menai strait, at the junction of the coast road with ways from Nant Ffrancon and Llanberis. Settlement in the neighbourhood is indicated by a British camp of supposed Roman date on a height overlooking the town. Roman connections are slight, but there are traditions of its religious and educational fame in the days of Celtic Christianity. The cathedral dedicated to St. Deiniol seems to have associations with this period. During the middle ages the building suffered severely from raids from the hills around, notably at the hands of Glyn Dwr (Glendower, *q.v.*) in 1404, and it remained in a poor state of repair until the 19th century. Slight traces of a Norman motte and bailey castle exist on the summit of a steep rock opposite Friars school. A free grammar school was established in 1557 on the site of a convent of White Friars and is still known as the Friars school. The town showed marked conservative tendencies during the Civil Wars and the 18th century, but the influence of the quarry workers of the neighbourhood during the 19th century made the town a centre of the national, religious and educational movements of the period.

The University college of North Wales was founded in Bangor in 1884, and in 1893 it became a constituent college of the University of Wales. Its permanent buildings, finely situated on a hill, were opened in 1911 and have received large additions opened in 1926 as a North Wales memorial to those who gave their lives in the World War. The city already possessed a North Wales Counties' Training college which had an unusually distinguished succession of students in its early days. There is also a Training college connected with the Episcopal church and a Theological college associated with the Baptist and Independent churches.

The town has grown in somewhat distinct parts; that near the straits, that near the cathedral and that on the height near the University college. Port Penrhyn nearby exports the slates of the Bethesda and Penrhyn slate quarries in the valleys of Snowdonia. Bangor was made a municipal borough in 1883 and is one of the boroughs of Carnarvonshire for purposes of parliamentary representation.

BANGOR, a city of Maine, U.S.A., on the west bank of the Penobscot river, at the mouth of the Kenduskeag and the head of navigation, 60m. from the ocean and 75m. north-east of Augusta; a port of entry and the county seat of Penobscot county. It is on the Atlantic highway, and is served by the Maine Central and the Bangor and Aroostock railways and by the Eastern steamship company. The population was 21,850 in 1900; 24,803 in 1910; 25,978 in 1920, of whom 3,740 were foreign-born white (chiefly Canadians); and was estimated at 26,644 in 1925.

Bangor is the financial and commercial centre of a large agricultural and industrial region, which is rapidly being built up with wood-pulp, paper and textile mills; vegetable, sardine and blueberry canneries; cheese, canoe, and other factories. Bangor and its neighbouring city Brewer together have more than 100 diversified industries, with shoe factories and iron works predominating. Hydro-electric power is available from the Penob-

scot, Union, and Machias rivers, and the site of the proposed tidal power project at Quoddy bay is only 135m. away.

Bangor is also the cultural and medical centre of eastern Maine. It supports a symphony orchestra and an annual music festival, and its public library has 100,000 volumes. The Bangor theological seminary (Congregational; incorporated 1814) was established here in 1819. At Orono, eight m. up the river, is the State university (founded 1865), which has an annual enrolment of more than 1,200. Bangor has a State hospital for mental diseases and a State general hospital, and maintains a tuberculosis sanatorium. Opportunities abound for both winter and summer sports, including hunting, fishing, mountain climbing, snowshoeing and ski-ing; there is a municipal swimming pool, skating rink and toboggan slide. A carnival of winter sports is held.

In 1604 Samuel de Champlain ascended the Penobscot to the site of Bangor, in search of the legendary city of Norumbega, but found there only an important rendezvous of the Indians. The first permanent settler, Jacob Buswell, came from Salisbury (Mass.) in 1769. Originally called Sunbury, the name Bangor, was substituted by the Rev. Seth Noble after a favourite hymn, when he was sent to Boston in 1791 to petition for incorporation. The first saw mill was built in 1763; the first vessel in 1791; and the first bridge across the Penobscot to Brewer in 1832. The city was chartered in 1834. In 1812 it was occupied by the British.

After 1820 began the golden age of lumbering and shipbuilding, when fortunes were amassed and fine homes were built. The streets on the east side of the city were laid out by Charles Bulfinch, the leading architect of Boston, who also designed many of the buildings. By 1870 Bangor was one of the foremost lumber markets, and shipyards, a mile in extent, built vessels which carried Maine pine to all parts of the world. In the next period the ice-cutter was the characteristic industrial figure, and it has been superseded in turn by the maker of pulp and paper.

BANGOR, a borough of Northampton county, Pa., U.S.A., 14m. N. of Easton; on the Lackawanna and the Lehigh and New England railways. The population in 1920 was 5,402. There are numerous slate quarries in the vicinity, and the borough manufactures structural slate, silk, gloves, hosiery and furniture.

BANGORIAN CONTROVERSY, a theological dispute which originated in 1716 with the posthumous publication of George Hickey's (bishop of Thetford) *Constitution of the Christian Church, and the Nature and Consequences of Schism*, in which he excommunicated all but the non-juring churchmen. Benjamin Hoadly (q.v.), the newly-appointed bishop of Bangor, scented the opportunity and wrote a speedy and able reply, *Preservative Against the Principles and Practices of Non-Jurors*, in which his own Erastian position was defended. This was followed by his famous sermon, preached before George I. on March 31, 1717, on *The Nature of the Kingdom or Church of Christ*, in which he identified the Church with the Kingdom of Heaven—it was therefore "not of this world," and Christ had not delegated His authority to any representatives. Both book and sermon were reported on by a committee appointed by the Lower House of Convocation in May, and steps would have been taken by the archbishop and bishops had not the government stepped in and prorogued Convocation till November. Hoadly was shrewd enough not to answer the most brilliant, though comparatively unknown, of his antagonists, William Law. The most important result of the controversy was the silencing of Convocation, for that body, though it had just "seemed to be settling down to its proper work in dealing with the real exigencies of the Church" when the Hoadly dispute arose, did not meet again for the despatch of business for nearly a century and a half. (See CONVOCATION.)

BANGUED, a municipality (with administration centre and 18 barrios or districts) and capital of the mountainous province of Abra, Luzon, Philippine Islands, located in the interior some what over a mile from the Abra river and not far from the sea. Pop. (1918), 13,892, of whom 6,621 were males and two whites. The region round about produces mainly corn, tobacco and rice. In 1918, it had 758 household industry establishments with output valued at 174,000 pesos; and eight schools, all public. The natives are chiefly Ilocanos.

BANGWEULU, a shallow lake of British Central Africa, formed by the head streams of the Congo. It lies between 10° 38' and 11° 31' S. and is cut by 30° E. Bangweulu occupies the north-west part of a central basin in an extensive plateau, and is about 3,700 ft. above the sea. The land slopes gently to the depression from the south, east and north, and into it drain a considerable number of streams, turning the greater part into a morass of reeds and papyrus. The greatest extent of open water is about 60 m. N. to S. and 40 m. E. to W. There are several islands in the lake, the largest being Kirui, Kisi and Mbawali. South of Bangweulu the swamp extends to 12° 10' S. Into this swamp on its east side flows the Chambezi, the most remote head stream of the Congo. Without entering the lake the Chambezi mingles its waters in the swamp with those of the Luapula. The Luapula, which leaves Bangweulu at its most southern point, is about a mile wide at the outflow, but soon narrows to 300 or so yd. West of the Luapula and near its outflow lies Lake Kampolombo, 20 m. long and 8 broad at its southern end (see CONGO). The flood waters of the Chambezi and other streams, which deposit large quantities of alluvium, are gradually solidifying the swamp, while the Luapula is believed to be, though very slowly, draining Bangweulu. The waters of the lake do not appear to be anywhere more than 15 ft. deep.

Though heard of by the Portuguese traveller, Francisco de Lacerda, in 1798, Bangweulu was first reached in 1868 by David Livingstone, who died six years later among the swamps to the south. It was partially surveyed in 1883 by the French traveller, Victor Giraud, and first circumnavigated by Poulett Weatherley in 1896.

See P. Weatherley in *Geog. Journ.* vol. xii. (1898) and vol. xiv. p. 561 (1899); L. A. Wallace in *Geog. Journ.*, vol. xxix. (1907), with map by O. L. Beringer. Giraud's *Les Lacs de l'Afrique équatoriale* (Paris, 1890) and Livingstone's *Last Journals* (1874) may also be consulted.

BANIAS: see CASTE.

BANIM, JOHN (1798–1842), Irish novelist, sometimes called the "Scott of Ireland," was born in Kilkenny on April 3 1798. Banim taught drawing in Kilkenny and had an unhappy love affair with one of his pupils. The parents forbade the girl's marriage. She died, and Banim was much shaken by his sorrow. In 1820 he settled in Dublin. His *Damon and Pythias* was performed at Covent Garden in 1821. During a short visit to Kilkenny he married, and in 1822 planned, in conjunction with his elder brother MICHAEL (1796–1874), a series of tales, illustrative of Irish life, which should be for Ireland what the Waverley Novels were for Scotland. He then set out for London and supported himself by writing for magazines and for the stage. A volume of miscellaneous essays was published anonymously in 1824, called *Revelations of the Dead Alive*. In April 1825 appeared the first series of *Tales of the O'Hara Family*. One of the most powerful of them, *Crohoore of the Bill Hook*, was by Michael Banim. In 1826 a second series was published, containing that excellent Irish novel, *The Nowlans*. John's health had given way, and the next effort of the "O'Hara Family" was almost entirely the production of his brother Michael. *The Croppy, a Tale of 1798* (1828) is hardly equal to the earlier tales, though it contains some vigorous passages. *The Denounced, The Mayor of Windgap, The Ghost Hunter* (by Michael Banim), and *The Smuggler* followed in quick succession and were received with considerable favour. John Banim, meanwhile, had become very poor. In 1829, during his absence in France, a subscription was raised to meet his necessities. With this and a Government pension of £150, he returned to Ireland in 1835 and settled in Windgap Cottage, a short distance from Kilkenny; and there, a complete invalid, he passed the remainder of his life, dying on Aug. 13 1842. Michael Banim had acquired a considerable fortune, which he lost in 1840. After this disaster he wrote *Father Connell* (1842), *Clough Fionn* (1852), *The Town of the Cascades* (1862). Michael Banim died at Booterstown on Aug. 30 1874.

The true place of the Banims in literature is to be estimated from the merits of the *O'Hara Tales*, which are masterpieces of faithful delineation of Irish peasant character. The incidents are sometimes horrible, and the authors have been accused of strain-

ing after melodramatic effect. The lighter, more joyous side of Irish character received little attention from the Banims.

See P. J. Murray, *Life of John Banim* (1857).

BANISTER, JOHN (1630-1679), English violinist, was sent to France by Charles II. to study, and on his return was made leader of the king's band in succession to Baltzar. On Dec. 30, 1672, he gave the first of a series of concerts at his own house, and may be said to have been the first giver of concerts on a financial basis in London (see *CONCERTS. History*). Many songs of his and some short pieces for strings are preserved. His son, JOHN BANISTER (d. 1735), was, like his father, principal violin in the Italian opera at Drury Lane, and contributed to Henry Playford's *Division Violin* (1685).

BANJALUKA (Banialuka), the capital of a district of the same name in Bosnia, Yugoslavia. Pop (1921) 18,001. It lies on the river Vrbas at the head of a defile, at the military railway terminus for Prejedor. A postal motor connects the town with Jajce, but it is not yet (1928) linked up with the Yugoslav railways. The citadel and barracks, with the 16th century Ferhadiya Jamia (largest and most beautiful of the 40 mosques in the town) stand between the river and a small tributary. There is a Roman Catholic and also an Orthodox bishop. The Roman baths are in ruins, except one massive domed building, dating from the 6th century and still in use, although modern baths are also open, for the development of the hot springs. Other buildings are the Franciscan and Trappist monasteries, technical school, military academy, and Turkish Bazaar. Anthracite, iron, silver and other minerals are found in the adjoining hills: and the city possesses a Government tobacco factory, a brewery, gunpowder mills, a model farm, and many corn mills, worked by the two rapid rivers, the best wheat in Yugoslavia being grown here. There is an important annual stock and produce fair, at which horse racing by civil and military is a popular feature.

Banjaluca is probably the Roman fort, *Castra of the Tabula Peutingeriana*, on the river Urbanus and the road from Salona on the Adriatic to Servitium in Pannonia. Its later name, "Baths of St. Luke," is unexplained. In the 15th century the fall of Jajce, a rival stronghold, 42m. south, led to the rapid rise of Banjaluka, thenceforward the scene of many encounters between Austrians and Turks, notably in 1527, 1688 and 1737. It had great importance in the last half of the 18th century. In 1831 Hussein Aga Borberli, the "Dragon of Bosnia," set forth from Banjaluka on his holy war against the Sultan Mahmud II. (See *BOSNIA*)

BANJERMASIN or **BANDJARMASIN**, the chief town on the southern side of the island of Borneo, on the river Matapura, near its junction with the Barito, situated some 24 m. from the mouth in the bay, in S lat. 3°32', and E longitude 114°38'. The meaning of the word is "saline garden." It was formerly a principality under the sultan of Banjarmasin with an area of some 4,840 sq. miles. The town, with a population of some 70,000 inhabitants of many races, is the seat of the Dutch Resident of South-eastern Borneo. Its buildings stand on either bank of the river, but most of the inhabitants occupy houses either floating on rafts or built on piles along the water's edge. As large vessels can sail right up to the town, it is an important centre for the districts watered by the Barito and other large rivers. The jungle products are rattans, benzoin, wax, gutta-percha, gold, diamonds, iron and coal. Plantation rubber is grown by both natives and Europeans. Pepper was cultivated for many years, before it became a monopoly of the Dutch Government, but its cultivation is now dwindling, except for a few Chinese gardens. The geological formations appear to be Plutonic and sedimentary. Coal mines are being worked.

History.—The sovereignty of Banjarmasin in olden times extended over the whole of the south-eastern portion of Borneo. Tradition assigns the foundation of the State to Ampu-Jatmika, son of Mangkunbumi, a Coromandel merchant. Ampu-Jatmika went from India to Borneo, giving the country the name of Nagara-dipa and settled on a river still called Nagara. Here are still to be seen the remains of stone edifices said to have been the residence of the first princes. The date of settlement is uncertain but may be about A.D. 1200. In the third generation the only

descendant of the founder was a princess, who married a prince of Majapahit, in Java, who took the title of Raden Suryanata. From his time to the overthrow of Majapahit in the year 1478, Banjarmasin continued tributary to that Javanese State, which assisted it in extending its dominions eastward, until they embraced the States of Kuti and Pasir.

The people professed a rude Hinduism, similar to that of Java, but about the beginning of the 16th century they became Mohammedans, having been converted by the State of Damak in Java immediately after the subversion of the Hindu State of Majapahit, at about the time of the first appearance of the Portuguese in the Archipelago. In 1700 the East India Company established a factory in Banjarmasin, but the place was found to be unhealthy, and the Company's servants were finally attacked by the natives, whom they repulsed with great difficulty. The settlement was abandoned. The English again seized Banjarmasin in 1811, but restored it in 1817. Of the commercial community the Chinese are a very important portion, and there is also a considerable number of Arabs. The district of Banjarmasin was incorporated by the Dutch in consequence of the war of 1860 in regard to the succession in the sultanate, which had been under their protection since 1787. The town of Matapura was the seat of the sultan from 1771. The inland portion of the district is covered with forest, while the flat and swampy seaboard is largely occupied by rice-fields.

(C. H ; E S)

BANJO, a musical instrument with strings plucked by fingers or plectrum, popular among the American negroes and introduced by them into Europe. The word is either a corruption of "bandore" or "pandura" (*q. v.*), an instrument of the guitar type,

BY COURTESY OF CARL FISHER INC
THE BANJO, THE FAVOURITE MUSICAL INSTRUMENT OF THE AMERICAN NEGRO, IS PROBABLY OF AFRICAN WEST COAST ORIGIN

or is derived from "bania," the name of a similar primitive Senegambian instrument. The banjo consists of a body composed of a single piece of vellum stretched like a drum-head over a wooden or metal hoop. Attached to the body, which has no back, is a long neck, terminating in a flat head acting as a peg-box and bent back slightly. There are five, six or nine strings to the banjo, which are fastened to a tail-piece, as in the violin, pass over a low bridge on the body, and are strained over the nut or ridge at the end of the neck, where they are threaded through holes and wound round the tuning-pegs fixed in the back of the head in oriental fashion, as in the lute (*q. v.*). The strings are stopped by the pressure of the fingers against the finger-board which lies over the front of the neck.

The vibrating length of the strings from bridge to nut is 24in for all except the highest in pitch, known as the "chante-relle," "melody" or "thumb string," which is only 16in long, and whose tuning peg is inserted half-way up the neck. The tone of the banjo is louder and harder than that of the guitar.

BANK, known also as "POLISH BANK" and "RUSSIAN BANK," a card-game. An ordinary pack is used. Five or six players is a convenient number. Each contributes an arranged stake to the pool. The dealer gives three cards to each player and turns up another; if this is not lower than an eight (ace is lowest) he goes on till such a card is exposed. The player on the dealer's left, without touching or looking at his cards, can bet the amount of the pool, or any part of it, that among his cards is one that is higher (of the same suit) than the turn-up. If he wins, he takes the amount from the pool; if he loses, he pays it to the pool. Each player does the same in turn, the dealer last. Whenever the pool

is exhausted, a fresh stake is put into the pool. After a round is over the deal passes. No player may touch his cards until he has made his bet; the penalty is a fine to the pool of twice the stake, and the loss of his right to bet during that round. (For the commercial "bank" see **BANKS AND BANKING**.)

BANK. This article deals with the relation of the public to the banks. The other branches of the subject will be found under **BANKING AND CREDIT**; **BANKS, HISTORY OF**, etc. The public's relations with the banks take three main forms. Firstly, when the public is lender, and the bank the borrower; secondly, when the public is the borrower and the bank the lender; and thirdly, when the bank acts as the public's agent, or servant, in one of many capacities.

Deposits.—The public's loans to the banks take two main forms: (1) money lodged on deposit account; (2) money lodged on current account.

The first point for the public to appreciate is that their "cash at the bank" is in reality their loans to the bank, and that the bulk of this money is re-lent to the public. This last point will be considered later, but meanwhile it may be pointed out that just as when a lender forces money on a borrower, the borrower need not accept the loan at all or need not take farthings or five-pound notes, so can the bank exercise a similar discretion. A manager who refuses to open an account, or a cashier who rejects farthings or who insists on the customer signing his name on a banknote, is within his legal rights.

A deposit account is subject to withdrawals at, as a rule, a week's notice, and the bank adjusts its own lending policy in accordance with this rule. Interest is payable at two points below bank rate in so far as London is concerned, and in general the bank must maintain a margin between its "borrowing" rates and its "lending" rates, as on this margin the bank has to live.

Very often, a manager will allow withdrawals to be made from deposit account at less than a week's notice (cases have occurred where money has been withdrawn from deposit on demand), but this is a concession.

A current account is always subject to withdrawals on demand, and in the vast majority of cases these withdrawals do not take the form of cash, but consist of transfers by cheque from one account to another. Cheques are defined and discussed elsewhere (see **CHEQUE**), but one or two matters concerning them will here be relevant.

Cheques.—As a rule, four sets of people are concerned in the payment of every cheque—the drawer, the drawee's bank, the payer and the payee's bank. This is the simple and most common case. The cheque is first handed by the payee, together with a "paying-in" slip, to the cashier at his own bank. The paying-in slip is passed to the ledger-keeper and then to the pass-book clerk, who makes the necessary credit entry in the customer's account in the ledger and in his pass-book. The cheque itself is passed through ultimately to the bank's representatives at the clearing house. Here it is handed over to the representatives of the drawer's bank, who return with it and pass it to their own ledger-keeper. He in his turn makes the debit entry in the drawer's account, and then sends the cheque to the pass-book clerk to be entered in the drawer's pass-book and kept for return to the drawer.

Now the first and essential point is that this cheque is but one of thousands. A highly complex system of listing and sorting is necessary at the payee's bank to ensure that each cheque paid in finds its way to the bank on which it is drawn. In London, for example, cheques on other branches of the bank need one kind of segregation, cheques for the clearing house need another, for "walks" another, and for the Bank of England yet one more. The procedure here is to list together all cheques drawn on any one bank; thus bank A would make separate bundles of cheques drawn on bank B, bank C and so on. When all these cheques reach the clearing house, each bundle can go direct to the representative of the bank concerned and it may be added here that it is at the clearing house that the inter-bank transfers of money take place. At the end of the clearing, each bank "owes" for all the cheques drawn on it, and is "owed" for all the cheques paid into it. A balance is struck of "owes" against "owed," and the

bank's own account at the Bank of England debited or credited according as the final balance is minus or plus.

The customer can help materially towards the successful operation of the clearing system.

(1) The afternoon clearing occurs after banking hours. When agitating for an extension of banking hours, he will do well to remember that a bank has about two hours' work to do after it has closed its doors.

(2) Sorting takes place at top speed, and the sorter gets to know instinctively the "look" of each cheque. Hence the man who draws cheques on plain paper is a nuisance.

(3) Banks undertake definite responsibilities to meet any losses due to forgery, fraud, etc. In return, they are entitled to take various precautions. That is why endorsements to cheques must be meticulously correct, why alterations must be signed by the drawer and *not* initialled, and why the payee must conform to the rules, etc., of crossed cheques. The receiving cashier at the payee's bank is for the purpose of that cheque the representative of his own bank, the drawer's bank and the drawer himself, and is serving the interests of all three.

(4) In England the customer should learn the meaning of the letters T, M and C in the bottom left-hand corner of every cheque. T means "town," *i.e.*, cheques drawn on banks within a few minutes' walk of the clearing house in Lombard street. These are cleared in the town clearing, which takes place twice a day. M means "metropolitan," *i.e.*, cheques drawn on banks within half-an-hour of the clearing house. These cheques are only cleared once a day. C means "country," *i.e.*, cheques drawn on all banks outside the Metropolitan radius. The country clearing is held once a day, but it obviously takes a double post to transmit a country cheque to the drawer's bank and to receive the assurance that all is in order.

Every day a certain number of "returns" or "unpays" come to every bank through the clearing. These refer to cheques, which, when they reach the drawer's bank, are rejected, either because the drawer's account is overdrawn, or because of some irregularity in the cheque. As, for convenience's sake, the payee has originally been credited, he is now debited and the unpaid cheque returned to him for suitable action.

In the case of a country unpaid cheque, two days must clearly elapse before it is returned to the payee. During this time, the payee's bank reserves the right to refuse to let the payee draw against the proceeds of this cheque.

(5) Certain banks have special paying-in forms for country cheques. The use of these facilitates sorting.

(6) Every cheque costs the banks a certain amount of money for its clearance. The cost is the same whether the cheque is for one shilling or £1,000,000. The ideal customer is he who keeps a big balance and draws one cheque a year. A customer who draws a cheque every time he has a few odd shillings to pay is a nuisance. Also a customer who keeps only a small balance, may have to pay a charge to the bank to compensate it for the work done in clearing his cheques.

It may be added that whereas a bank will receive cash or cheques for the credit of an account without question or identification, and at any of its branches, it obviously will not *pay out* cash unless it is satisfied that all is in order and unless the would-be recipient can establish his identity and title.

The Bank as Lender.—The bank's loans to the public also take various forms: (1) short loans; (2) discounts; (3) time loans of a definite amount; (4) overdrafts and running loans. Short loans concern the *money market* and the *Stock Exchange*, and the reader is referred to articles under these headings.

Bills.—As regards discounts, the reader should read the article on **BILL OF EXCHANGE**, and his acquaintance with this article is assumed. In general, every branch of a bank is prepared to discount approved bills for its customers, but certain rules and limitations must be remembered.

(a) A bank only has a limited, though large, fund of money at its disposal, and has to meet many demands for accommodation. That is why head office has to ration branches and apportion fairly the funds available.

(b) The bank manager must know that his customer is of good repute and an "honest trader."

(c) The bill must explain itself and represent genuine business. If Mr. Smith tries to discount a bill drawn on Mr. Jones at three months in respect of a sale of cotton shirts, and if Mr. Smith is a shirt manufacturer and Mr. Jones a draper, and if the bill states that it represents a sale of cotton shirts, then Mr. Smith will have no difficulty. On the other hand, if Mr. Smith and Mr. Jones are impecunious gentlemen of no apparent occupation and proceed to draw bills on each other, and then seek to discount them at their bankers, they will meet with no success. Certain reputable firms, especially those engaged in international trade and finance, do draw "finance bills" upon each other, and these the banks are prepared to discount, even though they represent no trading transaction, but are only a means of transferring funds from where there is a temporary surplus to where they can fill a deficit.

In short, when seeking to discount a bill, tell the manager the full facts of your position, and see that the bill is in order and self-explanatory. The rate at which a bank discounts naturally varies, both with the general course of money rates and also with the class of bill; the rule being "the greater the risk, the higher the rate." The lowest rate is for bills endorsed by a bank, but "fine trade bills," or those bearing the names of sound, reputable traders, can be discounted at rates which are not much higher.

Overdrafts and Time Loans.—Time loans and overdrafts are best considered together. The essential point is that the money the bank is lending belongs to its customers and is repayable on demand. Hence any loan a bank makes must be a sound loan and must have a definite time limit to it. As a rule, a bank will not lend for more than six months. It will not lend money to finance new buildings, the installation of new machinery, or the purchase of other "fixed assets." The trader who needs money for such purposes must issue shares or debentures to the public or borrow elsewhere. The most the bank will do is to make a temporary loan, pending a debenture issue or other permanent borrowing, and even here a prudent banker will assure himself that preparations for the debenture issue are in hand, and that the customer is definitely committed to making it.

A bank is always ready to lend money, to help a customer round a corner and to earn profits for itself, provided it is told the full facts of the customer's position. A trader should submit a balance sheet and profit and loss account, and bear in mind a banker's complaint that "Mr. Jones showed one profit and loss account to me when he wanted a loan, and another to the surveyor of income tax over the road." He should further consult with his bank manager over the proposition he makes, and if the proposition has to go from the branch to head office, he should co-operate with the manager in "licking it into shape." Above all, he must make it clear that he intends to and can repay the loan at the end of the time limit fixed by the bank.

This is a suitable opportunity to differentiate between a definite loan and an overdraft. A loan for a definite amount and for a definite time is charged interest in full, whether or not the whole amount is immediately drawn upon; though it is possible that the customer can negotiate for some relaxation of this rule. An overdraft is only charged on the amount actually outstanding, even though an upper limit may have been arranged. Against this concession, the bank has the right to ask for an overdraft to be paid off at once. It is hardly necessary to add that an account cannot, of right, be overdrawn without the previous consent of the bank.

The usual rate of interest charged on loans and overdrafts is one point above bank rate, with a minimum of 5%. That is, any reduction in bank rate below 4% does not bring with it a reduction in the rate on loans.

Collateral.—Finally comes the question of collateral. In many cases a bank requires none. Loans to farmers are often unsecured, for the bank manager knows all about the farm, and knows that the farmer cannot pack up his farm and quit. Loans to manufacturers and traders are often secured by a debenture or mortgage on the plant, and loans are permitted up to the limit of this debenture. The best collateral is sound, readily marketable stocks

and shares. The usual procedure is for the borrower to transfer these to "the bank's nominees." The borrower continues to draw his dividends, but in case of need the bank can sell them over the borrower's head, handing him the difference between the net proceeds of the sale and the amount of his debt.

As the bank receives the proceeds of the sale on the next Stock Exchange settling day, it knows that if it has to realise the collateral, it will have to wait for its money only a fortnight. A loan of this kind, therefore, is "liquid" from the bank's standpoint.

If the professional man needs temporary accommodation and does not wish to realise his securities, the above procedure is far and away the best. If he lodges securities whose current market value is £500, and asks for an overdraft up to a limit of say £400, the bank is unlikely to object. He can then run his account up and down within that limit almost indefinitely. The bank knows it can always close down on him within a fortnight. The only danger-point is a fall in the market value of the collateral. If this occurs, the bank will either reduce the limit of the overdraft, or else call for further security.

Branch Banks and Head Office.—Whether he is borrowing or depositing money, a customer will find it assists him greatly in his dealings with a branch bank, if he appreciates the branch's relations with head office. Many lament the disappearance of the country banker, whose word was law in his own bank or small group of banks, and many complain that the modern branch manager is circumscribed as to the accommodation he can grant. In these days of "big business," such laments are vain, and if the modern branch bank has lost the independence of its predecessor it has also lost its insecurity. To-day money banked at any one of 1,000 branches is guaranteed by the resources of all the 1,000.

The modern big bank has "to lend to live," just the same as the small country bank. Out of the margin between its deposit rate and its loan rates it has to pay all its expenses and dividends. It is not true that a branch manager is discouraged from lending, but on the contrary he is judged by his superiors partly on his success in winning sound, profitable business for his branch. At the same time, the advance department at the head office has to ration out the money the bank has to lend, and it is for this reason that all applications for loans beyond a certain limit have to be referred by the branches to head office. Again, it is obvious that the advance department wants all applications to be reduced as far as possible to "a common form," as otherwise the task of discrimination would rapidly become an impossible one. It is as important for the customer to realise this as the branch manager, and this is why the customer is advised to co-operate with the branch manager in drawing up his application.

Banks' Services to Their Customers.—Space does not permit of more than the bare enumeration of the multitudinous services performed by a modern bank for its customer, many of them free of charge.

(1) The custody of stocks and shares and other valuables. This means more than bare safe-keeping. It includes the cutting and collection of coupons, the direct collection of dividends, and also a continuous watch on the drawing of bonds, the payment of coupons in arrears, and other matters affecting vitally the interests of the customer. The bank will also buy and sell stocks and shares on behalf of the customer, though in many ways it is better for the customer to deal direct with a recognized broker.

It may be added that far the most convenient way of holding stock is in the form of bearer bonds permanently kept and administered by the bank. The risk of loss is non-existent, and the convenience of handling is considerable.

(2) The financing of trade. A bank is prepared to undertake the collection and payment of bills of exchange for its customers, crediting or debiting them accordingly. In approved cases, it will accept or endorse bills on behalf of its customers and open credits for its customers under the usual conditions and terms. It will handle all documents and in general do all it can to assist its customers. Services such as these are, of course, subject to small charges, and the customer is advised to consult his own manager as to details, and as to what in his case the bank is prepared to do.

(3) The bank will issue letters of credit or traveller's cheques to customers wishing to travel abroad. Full information can be obtained from any branch.

(4) The bank will buy or sell foreign exchange, spot or forward, for its customers, under approved conditions.

(5) The bank will obtain passports for its customers, and also deal with their in-coming letters.

(6) The bank will act on behalf of its customers in income tax negotiations.

(7) The bank will make periodical payments, such as rent, subscriptions, etc., on instructions from its customers.

(8) Finally, the bank will act as a trustee, and as an executor of a customer's will. (N. E. C.)

BANKA, an island of the Dutch East Indies, off east coast of Sumatra, across the Banka Strait, at its narrowest point 9m. wide. On the east, Gaspar Strait, wider, and island-studded, separates Banka from Billiton. Banka with its dependencies forms a residency of Sumatra. It is 138m. in length, 62 wide, and its area, with a few adjacent islands (Lepau, 128sq.m.), is 4,460sq.m. The soil is somewhat dry and stony, but the greater part of the surface is covered with tropical vegetation, though the virgin forest has almost disappeared, owing to mining and agricultural operations. The hills, of which Maras, in the north, is the highest (2,760ft.), are covered with vegetation to their summits. Banka resembles the Malay peninsula geologically, with formations of granite, Silurian and Devonian slate, frequently covered with sandstone, laterite (of small fertility), and alluvium. The granite runs from W.N.W. to S.S.E., in short, irregular hill-chains. These are generally near the east coast; hence the rivers of the west coast are the longer. There are no volcanoes, the coast is difficult, and the number of anchorages small. The rivers run in deep valleys and in their upper courses, and some in their lower courses, form extensive marshes. Nevertheless many are navigable for nearly 20m, owing to the fact that they were once inlets of the sea, and are tidal for some distance. They are used for transport of tin. The Sungei Selan and the Jarin are the largest. Banka is one of the chief tin-producing centres of the world. Tin-mining is a Government monopoly. The ore is found in many river-alluvial deposits, and in the alluvial strata on the slopes of small hills, and is worked exclusively in open cuts. Some deposits, however, extend into the sea, and workings are continued beyond the coast. The labour is supplied by contract Chinese coolies, who work under Government supervision, and electrical power is used very largely. In 1925-26, the production of tin was 336,750 piculs (1 picul = 136.23lb.), valued at 60,732,542 florins (1 florin = rs. 8d.) and showing a net profit of 43,206,002 florins, the highest recorded since the opening of the mines. The climate is hot, especially from May to August (S.E. monsoon), but at night, in the hills, it is quite cool. The average mean annual rainfall is 118in., and the average number of rainy days 159. The wet, and cooler, season is from November to February (N.W. monsoon). Pop., 160,358, including 68,359 foreign Asiatics, mostly Chinese. The natives (Mohammedans), are composed, mainly, of immigrant Malayan peoples, the aborigines being represented by a few rude hill-tribes, probably of mixed Malay origin, and akin to the Bataks of Sumatra: they live by hunting, fishing, and the collection of forest products: there are also *Orang laut*. Rice, pepper, (grown by Chinese), gambier, coffee, and coco-nut palms are cultivated. There are over 1,000m. of roads fit for wheeled traffic, but no railways. The island has cable connection with Sumatra and very frequent and regular steamship communication with Java and Sumatra, and with Singapore and Penang. The chief town is Pangkal Pinang (pop. 5,696), on the east coast, and the chief port is Muntok, at the north end of Banka Strait. The sultan of Palembang, in Sumatra, ceded Banka to the British in 1810, but in 1814 it was exchanged for Cochin in India, and since that time it has remained Dutch.

See H. Zondervan, *Banka en Zijne Bewoners* (1895); *Handbook of the Dutch East Indies*, Buitenzorg 1924. (E. E. L.)

BANK ACCEPTANCES, bills of exchange or drafts drawn by individuals, firms, corporations, or other bankers for varying

periods after date or after sight, and accepted by banks or bankers. The U.S. Federal Reserve Board officially defines the bank acceptance as "a draft or bill of exchange, whether payable in the United States or abroad and whether payable in dollars or other money, of which the acceptor is a bank or trust company, a firm, person, company or corporation engaged generally in the business of granting bankers' acceptance credits." Bank acceptances are used primarily as a means of financing importing and exporting operations, but are also used in domestic transactions, being drawn against warehoused commodities or against the domestic shipment of goods.

In operation the bank acceptance is simple and effective. The buyer or receiver of goods, usually an importer, arranges with his bank to permit the seller or shipper of the goods, usually an exporter, to draw on the institution for the price of the goods, payable at a specified future time. Upon receipt of the draft or bill of exchange the bank accepts it by stamping on the face the word, "Accepted," together with the due date, the place of payment and the bank's signature. The acceptance is then returned to the seller of the goods and may be held by him till due and then collected, or may be discounted at any time. Foreign trade transactions are thus greatly facilitated because a bank of recognized standing substitutes its credit for that of the buyer or importer of goods and gives the seller "Grade A" paper which is available for immediate conversion into cash through discount. The accepting bank, of course, requires the buyer of goods to put it in funds to pay the acceptance upon maturity, which requirement is in the United States governed by the following rules observed by most banks: "The accepting bank shall require from its clients that it be placed in funds to meet acceptances on the day of maturity either by (1) the deposit of clearing house funds one day prior to maturity, or (2) the deposit of cash or check on the Federal Reserve Bank of New York on the day of maturity, or (3) debit to the account of the bank's client on day of maturity against funds cleared on, or prior to, such date." The contractual liability of an accepting bank is, according to opinion of counsel of the Federal Reserve Board, practically the same as that of the maker of a note. Hence, the holder of a bank acceptance has substantially the same rights against the bank as has the holder of a promissory note against the maker. To offset this primary liability, however, the bank has not only the assurance of the purchaser of the goods that he will put the bank in funds to meet the acceptance at maturity, but also may hold title to the goods themselves through the shipping or warehouse documents.

United States national banks are permitted by law to accept up to only 50% of their capital and surplus, but with the permission of the Federal Reserve Board may accept up to 100%; in no case, however, can the amount growing out of domestic transactions exceed 50%. The law further provides that a bank shall not accept for any one person, company, firm, or corporation, at any one time an amount exceeding 10% of its paid-up and unimpaired capital stock and surplus. (See **BANKING AND CREDIT**.)

BANK ACCOUNT, an account representing funds in the shape of cash, cheques, notes, drafts and coupons placed in a bank by an individual or an organization as a general deposit. Such deposits become the property of the bank. Thus the bank becomes a debtor to the depositor and the latter becomes a creditor of the bank and has a claim against it for the amount of the deposit and the right to demand the payment of all or any part of it. Bank accounts are usually either commercial accounts or savings accounts. Commercial accounts generally represent demand deposits, that is, deposits which may be drawn out by cheque without notice; but sometimes there are commercial time deposits, that is, funds placed in a bank subject to withdrawal only after a specified time or only after a certain notice to the bank of the intention to withdraw. Demand accounts, unless they carry balances in excess of a stipulated amount, seldom draw interest, but time accounts usually do. Savings accounts represent funds placed with a bank for the purpose of accumulation. They are a species of time deposit in that while they are subject to withdrawal, banks almost invariably reserve the right to require 30 days' notice before a withdrawal is made. Savings accounts draw interest, which is added to the principal and cumulated. Such cumulation

is usually quarterly, semi-annually or annually. Savings banks are banks specially chartered for handling savings accounts, though practically all commercial banks have savings departments. (See **BANKING AND CREDIT**.)

BANK BALANCE, a banking term which carries two significations: (a) the actual amount of a depositor's account at a bank at any specified time; (b) the difference between the debits and credits of a bank at the clearing house. If credits exceed debits, there is a credit bank balance; if the reverse condition obtains, there is a debit bank balance.

BANK CHARTER ACT. This act (passed on July 19 1844, as 7 & 8 Vict. cap. 32) is the basis of the present organization of the Bank of England, embodying the practical maxims of the so-called "currency school." To effect this, the act lays down three main principles.

(a) Limitation of the volume of uncovered issue, that is, notes not covered by bullion,

(b) Centralization of issue, and

(c) Separation, in the case of the Bank of England, of the business of banking and the business of note issue.

The first principle is given effect to by sections II. and X-XVII. of the act, which restrict the uncovered notes of the Bank of England to £14,000,000; enact that after the passing of the act no new bank of issue shall be permitted "in any part of the United Kingdom"; restrict the business of note issue to such banks and bankers as then lawfully issued notes (though allowing such banks, if amalgamating, to issue an amount equal to their aggregate circulation), depriving bankers once ceasing to issue notes from resuming such issue, and, finally, limiting the note issue of such bankers to the average of their circulation for a twelve-weekly period before May 6 1844.

The second principle is given effect to by the fifth and twelfth sections of the act. These provide that the Bank of England may increase its uncovered issue of notes by a sum equal to two-thirds of the notes previously issued by any banker, who ceases issue by agreement with the bank, or who discontinues issuing in consequence of bankruptcy or liquidation of the business, or on any other ground.

Separation of "Issue" and "Banking."—The third principle is given effect to by the second section of the act, which provides, in effect, that there shall be an issue department and a banking department at the Bank of England. Notes were to be freely issued if gold were tendered to the issue department at the rate of £3 17s 9d. in notes per ounce of standard gold (section IV.); but it was not the intention of the Act to force the issue department to hold *only* securities and gold; for by section III. the issue department was allowed to hold at any one time an amount of silver bullion not exceeding one-quarter of the gold coin and bullion in the issue department. Since 1853, however, except for a short period in 1860-61, the bank has ceased to hold silver in the issue department.

In addition to thus regulating the note issue, the act provided for a payment of £180,000 by the bank to the Government (section VIII.); exempted the notes of the bank from stamp duty (section VII.); provided that the profits from any increase in the uncovered circulation should go to the public (section IX.); provided—a most important section—for a weekly account of the state of the bank in prescribed form (section VI.), and for returns from other issuing bankers (section XVIII.).

For further details, see **BANK OF ENGLAND** and **BANKING AND CREDIT**. (T. E. G.)

BANKER, a dealer in credit; one who operates a bank or banking house through the use of the credit and funds of both himself and others. The term is often used in a very broad and loose sense to apply to capitalists, financiers, investment bankers, commercial paper bankers, stock brokers, and even the officials and higher employees of banks. Strictly, however, it should apply only to the credit merchant when he uses the credit and funds of others. If he uses only his own credit and funds he is a capitalist (*q.v.*); if he engages in the organization and financing of businesses and the handling of their securities he may be a financier, promoter, or broker (*q.v.*); if he is president, cashier, or other

official of a bank he is a bank officer. In most States the word "banker" legally means a private bank as distinguished from an incorporated bank, to which the legal term "bank" is applied. (See **BANKING AND CREDIT**.)

BANKER AND CUSTOMER. In Great Britain, with the exception of some few statutory provisions affording qualified protection to bankers paying or collecting on behalf of their customers certain classes of cheques, orders and drafts (where, but for such protection, forged or unauthorized indorsements might involve the banker in liability) there is no special law affecting the relation of banker and customer. Nor is there any satisfactory or exhaustive legal definition of the terms "bank," "banker," "customer." In the acts containing the statutory provisions referred to, *e.g.*, the Bills of Exchange Act, 1882, ss. 60, 79, 80 and 82; the Stamp Act, 1853, s. 19; the Revenue Act, 1883, s. 17, the two last of these terms are employed and therefore call for definition. There is no attempted statutory definition of "customer" at all. The term "banker," however, is defined both in the Bills of Exchange Act and the Moneylenders Act 1900 (excluding bankers from the purview of that act) as a person or body of persons corporate or incorporate carrying on "the business of banking"—not a very helpful definition—and what that business is has been treated by the courts as mainly a question of fact; the limits of that business cannot be laid down as mere matter of law but must depend on evidence to be adduced in any particular case (*Banbury v. Bank of Montreal*, 1918, A.C. at pp. 652-3). Modern banks perform, in conjunction with what is distinctive and characteristic banking business, other functions and services such as dealings in stocks and shares, trusteeships and executorships, etc., and in respect of these other services may incur liabilities. Questions may arise as to whether a bank is liable for the acts, defaults and representations of its servants or officials as being in the course of their employment. For instance, in *Banbury's* case, cited above, it was held on the evidence there adduced that advising on investments was not part of the ordinary business of the bank concerned, although it may be suggested that in other cases—as where a bank shares a broker's commission or acts as broker—evidence might establish the contrary. As to the distinctive tests to ascertain the meaning of "banker" and "banking business" as employed in the statutes referred to, decided cases have given some guide. In the *Birkbeck Building Society* case it was held that the Society had, *ultra vires*, carried on a banking business and *Buckley L. J.* in that case, 1912, 2 Ch. at p. 227, indicates the characteristic features of such a business. Reviewing this and other cases *Sir John Paget K.C.* in *The Law of Banking* (3rd ed., p. 6) usefully deduces that no one can be a banker who does not take deposit and current accounts, issue cheque forms, pay cheques drawn on himself and collect cheques crossed and uncrossed for his customers.

The term "customer" is without any formal definition. At one time it was thought that a single transaction, or the mere opening of an account, without more, did not constitute a customer, such term implying some course or habit of dealing. Later cases do not take that view and hold that duration or course of dealing is not of the essence of the definition (per *Lord Dunedin*, 1920, A.C. at p. 68), and that a customer is created immediately the banker has accepted and opened his account and has agreed to render to him the performance of banking duties whether it be a first transaction or not (*Ladbroke v. Todd*, 30 T.L.R. 433; *Commissioners of Eng. Scot. and Australian Bank*, 1920, A.C. 683). This is in contradistinction to casual services rendered by a banker to persons who have opened no account with him. One bank may be the customer of another bank for the purposes of s. 82 of the Bills of Exchange Act, as where a foreign or non-clearing bank has an account with a clearing bank that collects cheques for it (*Importers Co. Ltd v. Westminster Bank*, 1927, 2 K.B. 297).

Relationship of Banker and Customer.—Of necessity bankers and their customers enter into special contracts expressly or gathered by implication from course of dealing. Familiar examples are the deposit account and terms of withdrawal, keep-

ing of separate accounts, terms of loan or overdraft, discounting or collection of bills, letters of credit. Quite apart, however, from any special circumstances, the mere opening of an account current with a banker and the banker's acceptance thereof involve contractual relationship by implication. In 1848 the House of Lords in *Foley v. Hill* (L.R. 2 H.L. 28) declared that relationship to be one of debtor and creditor; that is to say, the moneys paid in by the customer are lent by the customer to the banker who is under obligation to repay an equivalent amount. The banker does not hold such moneys as trustee or mere deposit but they are his to do as he will with subject only to the obligation to repay. The old statement was that the banker was debtor to the customer of any credit balance with the "super-added" obligation to honour his customer's cheques drawn upon such balance in so far as the same was sufficient and available. This was not quite a complete statement in that one has to add that the obligation to repay arises only upon demand made by the customer. This exact point fell for decision in *Joachimson v. Swiss Bank Corporation*, 1921, 3 K.B. 110. Moreover in that case Atkin L. J. (now Lord Atkin) proffered a useful summary of the one and indivisible contract created by the account current in the following words:

"The bank undertakes to receive money and to collect bills for its customer's account. The proceeds so received are not to be held in trust for the customer, but the bank borrows the proceeds and undertakes to repay them. The promise to repay is to repay at the branch of the bank where the account is kept, and during banking hours. It includes a promise to repay any part of the amount due against the written order of the customer addressed to the bank at the branch, and as such written orders may be outstanding in the ordinary course of business for two or three days, it is a term of the contract that the bank will not cease to do business with the customer except upon reasonable notice. The customer on his part undertakes to exercise reasonable care in executing his written orders so as not to mislead the bank or to facilitate forgery. I think it is necessarily a term of such contract that the bank is not liable to pay the customer the full amount of his balance until he demands payment from the bank at the branch at which the current account is kept. Whether he must demand it in writing it is not necessary now to determine."

The above does not purport to be an exhaustive statement of all the terms of the implied contract. Indeed a little later the same court of appeal (in the case *Tournier v. National Provincial Bank*, 1924, 1 K.B. 461) declared a further term to be implied in the contract between banker and customer, whenever and however that relationship was constituted; namely, an obligation that the banker should not disclose to third parties any matter affecting the customer's account or any information coming to him in his character as the customer's banker except (a) by the express or implied consent of the customer himself (e.g., a trade reference invited by the customer), (b) under compulsion by law (e.g., an order under the Bankers' Books Evidence Act), (c) under a public duty to disclose (e.g., danger or treason to the State), (d) where the interests of the bank legally require disclosure (e.g., action against the customer for money due). This obligation persists even after closing of the account. Bankers have of course always acted honourably upon the principle of treating their customers' affairs in confidence and only disclosing in exceptional and justifiable circumstances, but *Tournier's case* has for the first time put the obligation as a legal incident of the implied contract. Where a customer gives to one with whom he is dealing a banker's reference, one has an example of express assent to such disclosure as is reasonably necessary to accord with the terms of the reference. But there is also a well-recognized practice as between bankers themselves, described as "a common courtesy," whereby a bank desiring information (e.g., as to the credit of a proposed guarantor or surety, or of an acceptor of a bill under discount, or of a bill accepted payable by the customer of another bank) inquires of the other banker. Information given in response to such inquiries is given confidentially and is framed with great care so as to disclose no more than the general position of the customer. Such cases are, it is presumed, supported as permissible

by reason of the implied consent of the customer derived from evidence of a well-known practice among bankers and the circumstances giving rise to the inquiry. A banker, his officials and servants are, as to any claims for defamation or for fraudulent misrepresentation, in the same position as any other member of the community. As regards the application of Lord Tenterden's act to bankers it has been held, however, that the signature of a manager to any representation on which fraud is based is not a sufficient signature to support an action against the bank for any false representation as to the credit or financial ability of another person.

The Account.—Reverting to the matters affecting the account as between banker and customer it should be noted that where there are several accounts any special agreement as to appropriation of payments into specific accounts must be observed: but if the customer makes no specific appropriation the right of application may devolve on the banker. As regards a banking account that is worked as an unbroken running account, however, in the absence of any special agreement the rule in *Clayton's case* applies as in all unbroken accounts where moneys are from time to time paid in and paid out by the customer. The rule is that presumably it is the sum first paid in that is first drawn out—the first item on the debit side is discharged or reduced by the first item on the credit side. The appropriation is, without express agreement to the contrary, naturally made by the dates in order as they come, so that the balance is struck at the foot of the account and the earlier credits go to discharge the earlier debits in order as they are entered. This is the main presumption of appropriation as regards an unbroken running account. Its importance in banking practice is obvious especially where the interests of third parties are involved. Thus the operation of this rule taken in conjunction with the rule in *Hopkinson v. Holt*, 1861, 9 H.L.C. 514 may deprive a banker of the benefit of priority for a security in respect of advances after he has received notice of a subsequent charge on the same property, if he continues the account after such notice as an unbroken account. His obvious course is to rule off the account upon such notice and make the necessary rearrangement with his customer (*London and County Banking Co. v. Ratcliffe*, 1881, 6 App. Cas. 722; *Deeley v. Lloyds Bank*, 1912, A.C. 756). Where there are several accounts the banker has the right to combine them against the customer in order to ascertain the available balance or the debit as the case may be, provided always that the accounts are the customer's own accounts and also that there is no special agreement express or implied that they are to be kept separate. A banker could not of course combine with an account or accounts held by the customer personally accounts known to be held by the customer in a fiduciary capacity. Although, subject to the above, a banker may combine accounts held by the customer in his own right, he must do so where "the ultimate balance" must be determined to fix the liability of a third party and securities have been lodged to cover the general balance (*Mutton v. Peat*, 1900, 2 Ch. 79).

Third parties may sometimes have a claim upon a credit balance standing in the name of a customer: as for instance where money is paid into the account by a third party under mistake of fact (*Admiralty Commissioners v. National Provincial Bank*, 38 T.L.R. 492; *Kerrison v. Glyn Mills and Currie*, 1911, 17 Com. Cas. 411) or in breach of trust (*In re Hallett's Estate* 13 Ch. D. 696) or as the fruits of fraud (*Banque Belge v. Hambrouck*, 1921, 1 K.B. 321). Moneys thus paid into the mixed account of a customer, and not being his own moneys, may be followed, in so far as a credit balance remains, as to that balance, and, in so far as securities have been purchased with such moneys, as to those securities, if traceable (see *Hallett's Estate supra* and *Sinclair v. Brougham*, 1914, A.C. 398 as to "tracing orders"). As has been judicially said, the older common law may have halted outside the banker's door but in 1879 (*Hallett's Estate*) "equity had the courage to lift the latch, walk in and examine the books." The same case made it clear that where a person holding money as a trustee or in a fiduciary character pays it into his account at his banker's and mixes it with his own money and afterwards draws out sums by cheques in the ordinary manner, the rule in

Clayton's case attributing the first drawings out to the first payments in does not apply, and the drawer must be taken to have drawn out his own money in preference to the trust money so that any remaining credit balance is subject to the charge of the defrauded or wronged party. In this class of case the banker usually takes up the neutral position as a quasi-stakeholder, leaving the customer and the claimant to contest between themselves the right to the credit balance. It is a false position to argue (as has been done) that the moment money is paid in to a customer's account the debtor and creditor relation between banker and customer and the merging of the money into mixed account obliges the banker to disregard the claims of a third party arising from alleged mistake, breach of trust or fraud. (See *Admiralty Commissioners v. National Provincial Bank supra.*) Of course all drawings out of the account honoured by the banker in the ordinary course of business without knowledge of any such claim as above or of any breach of fiduciary duty or any fraud on the part of the customer so drawing involve the banker in no liability even if it afterwards turns out that such drawings were in fraud or breach of trust.

Nor does the law impose upon the banker any duty to pry into his customer's affairs. Generally speaking, a banker is not bound or expected to make inquiries as to the source from which moneys paid in by a customer are derived or the purposes for which cheques are drawn by him (*Thomson v. Clydesdale Bank*, 1893, A.C. 287; *Bank of N.S.W. v. Goulburn etc. Co.*, 1902, A.C. 543). But a banker may be liable as privy to a breach of trust if he permits an agent or a trustee or a person in any fiduciary character (as for instance a director of a company) to misapply his principal's money where, from the circumstances, the banker knew, or must be taken to have known, that such money was being misapplied; nor is benefit to the banker an essential to his liability, although it is a circumstance which may strengthen the inference that he was privy to the breach of trust (*Gray v. Johnston*, 1868, L.R. 3 H.L. 1; *Foxton v. Manchester and Liverpool Banking Co.* 44 L.T. 406; *British Elevator Co. v. Bank of Brit. N. America*, 1916, A.C. 658). The heading of an account may show that it is in fact a fiduciary account, but any circumstances that indicate a fiduciary character may be adduced to affect the banker with notice of a trust.

Duty to Pay and Determination of Authority.—While the payment of a customer's cheques drawn on his account current is part of the recognized and implied relationship, it is different in the case of the payment of bills or other drafts or orders which are a matter of special agreement. That agreement may be expressed, or may be implied from the course of dealing obtaining between the parties. As to cheques, however, the obligation of the banker arises on the opening of the account. In the case of partnership, companies, administrative bodies or other bodies, a particular form of signature or signatures is agreed upon as the banker's authority to pay. But once the signature of his customer appears upon a cheque regular in form, it is the banker's duty to honour it, provided that there is a sufficient credit balance, that such balance is available to the customer, and that there has been no countermand or other determination of authority. If the banker wrongfully refuses to pay a cheque, he is liable in damages to his customer. If the customer is a trader or a business man, those damages may be substantial; if he is an ordinary private individual, the courts require some special grounds showing actual damage to credit before upholding any substantial claim (*Marzetti v. Williams* 1 B. and Ad. 415; *Rolin v. Stewart* 23 L.J.C.P. 148; *Evans v. London and Provincial Bank*, *Times* March 1, 1917; *Cox v. Cox and Co.*, *Times* March 18, 1921). In cases where the bank has by mistake represented to a customer in his pass book that a certain balance exists and the customer in good faith acts upon that assumption and draws cheques accordingly, the banker may be estopped from setting up the true facts, although it would have been open to correct the error before the customer, in good faith, acted upon it (*Holland v. Manchester & Liverpool District Bank*, 25 T.L.R. 386; *Skyring v. Greenwood* 4 B. and C. 289; *Holt v. Marnham*, 1923, 1 K.B. 504). It should be added that the customer's pass book, even when returned by

him, does not, without more, constitute a settled account between banker and customer. Hence the practice of some banks to request periodical signed statements by customers as to correctness of the account. Where forged or unauthorized signatures are the ground of repudiation of a cheque, the mere fact that the customer had had his pass book for examination is not, generally speaking, a bar to his claim (*Kepitigalla Rubber Co. v. National Bank of India* 25 T.L.R. 402) except in very special circumstances (*Morison v. Westminster Bank*, 1914, 3 K.B. 356). While a banker is bound to honour the customer's cheque in business hours at the branch on which it is drawn, there is an obligation upon the part of the customer to give his mandate in a clear and unambiguous form, so as not to mislead. Nor must he, by his own fault, so draw the cheque as to afford facilities for fraud. "Raised" cheques as they are often called (*i.e.*, cheques drawn for one sum but fraudulently by some dishonest servant or outsider raised to a greater sum) have often been paid by bankers. Obviously if the alteration is apparent, or so marked as would be apparent to an ordinary careful business man, or if there are evidences of alteration not initialled by the customer, the bankers should not pay without inquiry. But if the alteration be so well done as to escape reasonable detection, then if it has been rendered directly possible by the carelessness of the customer, as in leaving spaces facilitating alteration, the loss falls on the customer himself (*Young v. Grote*, 1827, 4 Bing. 253, finally vindicated and approved, after much intervening criticism in *Macmillan's case*, 1918, A.C. 777).

The holder of a cheque has no claim against the drawer's banker for non-payment, since a cheque is not in English law an assignment of funds in the banker's hands (Bills of Ex. Act 1882 s. 53). (It is otherwise in Scotland.) And an English banker would not pay a cheque in part when there is an available balance insufficient for the whole sum. But in the case of cheques presented simultaneously, in total exceeding the available balance, he should pay so many of the cheques as the balance will cover. The "marking" of cheques by bankers does not amount to an "acceptance" by the banker as against the holder of the cheque, who still has no remedy against the banker for non-payment, although, as between bankers themselves, "marking" may be recognized in practice as a binding representation that the cheque will be met. If such marking be done at request of the drawer, he cannot, generally speaking, afterwards revoke authority to pay.

By s. 75 of the Bills of Exchange Act the banker's authority to pay a cheque is revoked by countermand of payment by the customer himself or by the death of the customer. A credit balance, although sufficient in amount, may also become unavailable to meet cheques on the bankruptcy of a customer (or liquidation, if a company), or notice by the banker of an available act of bankruptcy, or insanity of the customer, or by attachment of the credit balance by process of court as by a garnishee order attaching the balance. As to garnishee proceedings, it is important to note that the order binds the whole balance attached, irrespective of the amount of the judgment debt in respect of which it is made (*Rogers v. Whiteley*, 1892, A.C. 118). As to current account, although there is no debt due until demand made by the customer, *Joachimson's case (supra)* expressly reserved the application of garnishee proceedings to accounts current. As to deposit accounts, the terms of withdrawal or repayment, usually evidenced by the deposit receipt or note, have to be looked to in order to ascertain whether there is then a debt due or accruing due that is garnishable. Determination of the banker's authority to pay by the customer's countermand, generally called "stopping a cheque," requires consideration. For if the banker pays after such countermand he is liable to the customer for having paid contrary to his mandate or authority, and cannot charge him with the payment. Such countermand, however, to be effective must have actually reached the banker and must be unequivocal and free from ambiguity both in its terms and method of communication; *e.g.*, a banker is not bound to act upon an unconfirmed telegram but in case of doubt is justified in reserving payment for such reasonable time as in the circumstances allow of enquiry (*Curtice v. London City and Midland Bank*, 1908, 1 K.B. 293). In the

case of an authenticated telegram wherein the customer erroneously gives the wrong number of the cheque he desires stopped, the court regards the number as the one certain means of identification, and will not lightly put upon the banker the fault by reason of other circumstances alleged to be such as to put him upon inquiry (*Hilton v. Westminster Bank*, 1926, W.W. 332, House of Lords; 43 T.L.R. 124). A banker is not bound to cash a cheque out of the advertised business hours, but, were he to do so, would he be liable to the drawer who had stopped the cheque on the re-opening of business hours next day? This question was raised, but not decided, in *Baines v. National Provincial Bank*, 32 Com. Cas. 216, where it was held that the payment, having been made within five minutes after closing time, was within such a reasonable margin as to constitute it a payment within business hours.

Conversion and Statutory Protections.—In the varied operations connected with banking business a banker is liable for any loss to the customer arising directly out of negligence, i.e., some act or omission which is contrary to the ordinary reasonable practice obtaining among business men and which is a breach of duty owing to his customer. But however careful a banker and his servants may be, there is always the risk of what is called conversion of a bill or cheque either in payment or collection thereof. That is to say the person tendering for payment or collection a cheque or bill may prove to have either no title or a defective title, and in such case a banker paying or collecting, however innocent of the true state of things existing, may be liable to the true owner for "conversion" or for "money had and received." It is conversion so to deal with a thing adversely to the true owner's rights of possession without his assent, and ignorance of the facts is no defence. As to bills and many other securities there is no statutory protection, but as to cheques and certain other orders there is limited statutory provision. As to the paying banker, we have s. 60 of the Bills of Exchange Act protecting a banker paying "bills drawn on a banker payable on demand" (i.e., cheques) in the ordinary course of business notwithstanding forged or unauthorized indorsements. This covers only true cheques and would not apply to those "cheques" frequently used by local bodies or other corporations attaching some condition to payment such as signing a receipt, etc. But s. 19 of the Stamp Act, 1853, accords a similar protection to any draft or order payable to order drawn upon a banker; and s. 17 of the Revenue Act, 1883, applies to such irregular "cheques" the benefit of the crossed cheques sections of the Bills of Exchange Act, 1882. The paying banker obtains protection when paying crossed cheques in accordance with their ostensible tenor (s. 80 and the proviso to s. 79).

With regard to the collecting banker, qualified protection against the perils of conversion is afforded by s. 82. Without such protection the customer's want of title may render the banker liable, since by collecting on an instrument to which the customer has no title or a defective title he is assisting in conversion of the true owner's property (*Arnold v. Cheque Bank*, 1876, 1 C.P.D. 578; *Fine Art Society v. Nina Bank of London*, 1886, 17 Q.B.D. 705). S. 82 enacts that "where a banker in good faith and without negligence receives payment for a customer of a cheque crossed generally or specially to himself and the customer has no title or a defective title thereto, the banker shall not incur any liability to the true owner of the cheque by reason only of having received such payment." In *Gordon v. Capital and Counties Bank*, 1903, A.C. 240 it was held by the House of Lords that a banker is not, within this section, "receiving payment for" the customer if he had credited the cheque as cash and allowed or agreed to allow the customer to draw against it before clearance, since he thereby becomes holder for value and collects for himself. Hence by an amending act of 1906 it was enacted that a banker should be within s. 82 "notwithstanding that he credits his customer's account with the amount of the cheque before receiving payment thereof." The protection thus accorded is strictly qualified by the holder of proof upon the banker that he acted "without negligence" (*Sonchette v. London County Westminster and Parrs Bank*, 1920, 36 T.L.R. 195) in every stage of the process of col-

lection, from the taking of the cheque to the receipt and disposition of the money. And on the other hand it is not merely the receipt of the proceeds of the cheque that is protected but "every step taken in the ordinary course of business and intended to lead to that result" (per Lord Macnaghten in *Gordon's case*, cited above, at p. 244). The test of negligence is whether the transaction of paying in any given cheque (coupled with the circumstances antecedent and present) is so out of the ordinary course that it ought to arouse doubts in the banker's mind such as to throw on him the duty of making inquiry. Instances of negligence familiar in decided cases, which are numerous, are: failure to detect an obvious non-correspondence of indorsement with the name of the payee (1900, 1 Q.B. 270); indorsement on the cheques payable to different persons being in the same handwriting; a company's cheque sent home for amendment alteration not initialled by both the directors who draw it (*Sonchette's case* above); omission to make inquiries as to a customer opening an account and paying in a stolen cheque (*St. John Hampstead v. Barclay's Bank*, 1923, 39 T.L.R. 229; *Ladbroke v. Todd*, 1914, 19 Com. Cas. 256); cheque payable to order of a public official endorsed and paid into his private account (*Ross v. London County Westminster and Parrs Bank*, 1919, 1 K.B. 678); cheque payable to a company indorsed and paid into a director's or secretary's private account, the company's account being kept elsewhere (*Hannan's Lake View v. Armstrong*, 1900, 16 T.L.R. 236, *Underwood v. Barclay's Bank*, 1924, 1 K.B. 775); cheque marked "account payee" where the circumstances raise a doubt as to whether the proceeds are being placed to that account—the words being a direction to the collecting bank so to place them (*Bevan v. National Bank Ltd.*, 23 T.L.R. 65; and see *Importers Co. Ltd. v. Westminster Bank*, 1927, K.B., as to clearing bank acting for collecting bank). For cheques not crossed and bills there is no protection against the risk of innocent conversion in collection. The damages in conversion, by collecting cheques to which customer has no title, may be mitigated by proof that the proceeds of cheques have been in some part applied to the proper purposes of the true owner (*Underwood's case*, *Sonchette's case*, *supra*), and an inquiry may be ordered accordingly.

If a banker can show that he holds a cheque as holder in due course, as having given value for it without notice of any defect in title, he of course needs no protection, for it is then his own property. If, for instance, a banker has credited his customer with the cheque on an agreement express or implied that he may draw against it before clearance, he may, if there is nothing to impute to him notice of any defect in title, be in such a position. Mere crediting in the books without such an agreement will not suffice (*A. L. Underwood and Co. v. Barclay's Bank supra*). And no forged indorsement must intervene, for forged signature confers no title at all.

In cases not covered by statutory authority where forgery or fraud intervene the banker has to rely on general legal principles. He cannot charge his customer with payments made on a forgery of the customer's signature; but if the customer has adopted the forgery or, having knowledge or reasonable ground for belief that it has been committed, has failed to warn the banker, the customer may be estopped from disputing the banker's right to debit him (*Vagliano v. Bank of England*, 1891, A.C. 107; *McKenzie v. British Linen Co.*, 1881, App. Cas. 82). *Bona fide* payment on a forgery to an innocent holder is payment under mistake of fact, but in case of negotiable instruments it is open to debate whether recovery back of the money so paid is permissible in any circumstances, having regard to the strict rule applied to negotiable instruments as stated and applied in *London River Plate Bank v. Bank of Liverpool*, 1896, 1 Q.B. 7 and referred to by Lord Cave L.C. in *Jones v. Waring and Gillow*, 1926, A.C. at p. 684; but see *Imperial Bank of Canada v. Bank of Hamilton*, 1903, A.C. 49, where the strictness of the rule was questioned.

Bankers' Lien and Securities.—As far back as the middle of the 19th century it was judicially decided that "bankers most undoubtedly have a general lien on all securities deposited with them as bankers by a customer unless there be an express contract or circumstances that show an implied contract inconsistent with

lien" (*Brandao v. Barnett*, 1846, 12 C. and F. 787). Where money is concerned, "set-off" is the appropriate term rather than lien. The above statement of banker's lien excludes documents or securities deposited for safe custody or deposited for any special purpose inconsistent with lien. And the implied general lien for balance of account is not needed where securities are specifically deposited as cover for amounts owing. There is in such cases a specific charge of the securities. But if securities so deposited are left in the banker's hands after the amount secured is cleared off, these securities may become subject to the general lien, as the customer, by leaving them, may be taken to have re-deposited them. And upon sale of securities to meet specific advances, if a surplus remains, the banker may have a right to set-off such surplus as against further sums due on general account. In the case of bills, notes and cheques, the banker has the right of a holder for value to the extent of his lien (Bills of Ex. Act s 27 [3]). In the case of other securities the banker has, presumably, the right of a pledgee, and after default, if notice to realise has been given, can sell the security and reimburse himself so far as possible. (See also MORTGAGE.)

Quite distinct from this implied general lien is the case of charges taken by banks to secure advances. Where the banker affords accommodation to his customer by fixed loan or overdraft, or both, he usually requires securities to be lodged. The large banks have well recognized common forms printed for mortgages and charges upon property of all kinds. Memoranda of general charge, together with deposit of deeds, securities, share certificates, policies and so on, are also provided, both where the customer himself provides the security and also where securities belonging to other persons are charged. In all cases the forms in use are so worded as to give the banker the fullest right over the property free from conflicting rights of sureties. In all cases of continuing accounts upon which advances are from time to time made by way of overdraft care has to be taken to observe the rule that notice of a subsequent charge on the same security by another person calls for the ruling off of the account, as, after notice, such subsequent charge ranks in priority as regards any future advances. (See above as to rule in *Hopkinson v. Holt* and rule in *Clayton's case*.)

The contract of personal guarantee is a characteristic, though ancillary or supplementary, security frequently taken by a banker. The common form is what is called a "continuing" guarantee; that is to say, not a guarantee of a fixed sum there and then advanced, but a guarantee of all sums then or thereafter from time to time advanced, and of all amounts in account between banker and customer from time to time outstanding against the customer. The contract of guarantee is a form of suretyship, the guarantor engaging to pay (usually on demand and up to a specified limit) any and all amounts at any time outstanding to the debit of the customer in the event of the customer's default. But in practice it would be a poor security were the banker, as creditor, to be subjected to the ordinary law relating to principal and surety, such as a claim for release by the surety in the event of the banker (the creditor), without the assent of the guarantor, granting time or indulgence to the customer (the principal debtor) or exchanging, releasing or surrendering other concurrent securities for the same debt. Moreover the banker requires to be in a position to prove in bankruptcy, or to accept compositions in respect of, the whole amount due and owing without competition by the guarantor. Hence the common forms of printed guarantee in use in the banks are so framed as to allow the banker to operate the account and deal with securities and their realization as he may think fit, and to prove and take compositions and act with complete freedom so as to get as near his 20s. in the £ as possible without endangering his remedy against the guarantor up to the agreed limit. It is quite usual to provide for a determination of the guarantee by the guarantor's giving of a fixed written notice—usually three or six months. This is a useful provision as without it a guarantor could at any time in case of a "continuing" guarantee give instant notice of determination, with the result that arrangements of the customer and banker might be considerably disturbed, for each cheque drawn on the overdrawn account is a

fresh advance. Notice of determination on the part of the guarantor does not affect liability accrued up to expiry of term of notice, but thereafter no advances can be made in reliance on the guarantee.

Bankers generally consent to receive for safe custody customers' property such as plate, securities and other valuable things. It has been debated whether a banker in such cases is a gratuitous bailee or a bailee for reward; in the former case he is liable only for neglect of such precautions as "a reasonably prudent and careful man may fairly be expected to take of his own property of the like description" (*Giblin v. McMullen*, 1868, L.R. 2 P.C. 317), whereas a bailee for reward is bound to provide at his own expense all appliances and safeguards possible. In view, however, of the well-known fact that bankers already have provided strong rooms, safes, etc., which are available, the test in both cases might be regarded as very much the same in practical effect.

See M. D. Chalmers, *A Digest of the Law of Bills of Exchange* (1879, 9th ed., 1927); H. L. Hart, *The Law of Banking* (3rd ed., 1914); Sir J. R. Paget, *Law of Banking* (3rd ed., 1922); J. Grant, *A Treatise on the Law relating to Bankers and Banking* (7th ed., 1923); Institute of Bankers (London), *Questions on Banking Practice*. (B. C.)

UNITED STATES

Generally speaking, in the United States, according to charter, there are two types of banks, national and State; the former being chartered by the Federal comptroller of the currency and the latter by the banking departments of the respective States. Under State charters, there are State banks and trust companies. The banking functions of the national banks, trust companies and State banks, with the exception of trustee or so-called mutual savings banks, are essentially similar. In a few States, mutual savings banks have been chartered. These banks have no capital stock, and the earnings, beyond that which is paid as dividends to the depositors, are placed in the guarantee fund. National banks which have the right to act in a fiduciary capacity are governed in that capacity by the laws of the State in which they are located. All national banks must be members of the Federal Reserve System; membership is optional with State banks, with the exception of the mutual savings banks which, under the Federal Reserve Act, are ineligible for membership.

Savings Banks and Accounts.—The Federal Reserve Act defines savings accounts as those governed by the following conditions: (1) The pass-book, certificate or other form of receipt must be presented to the bank when a deposit or withdrawal is made. (2) The depositor may be required to give notice of not less than 30 days of intended withdrawals. The definition of savings accounts, as given by the Federal Reserve Act, is accepted by banks whether they are members of the Federal Reserve System or not.

In the State of New York the State statute provides that only mutual savings banks may use the word "savings"; other banks, having in effect savings departments, call them special interest departments or thrift departments. In mutual savings banks, the investment of savings deposits is carefully regulated by law. Mutual savings banks have one kind of deposits only, viz., savings. In these banks the agreement between the bank and the customer is specific: to return the funds to the depositor upon his written order and the presentation of his pass-book. This pass-book is a contract between the bank and its depositor, while a checking account pass-book in other types of banks is merely a memorandum of the deposits. In some States a part of the capital and surplus of the banks is segregated for the savings department, and the savings deposits are segregated and invested in accordance with specific legislation. A 30 day notice governing withdrawals of savings deposits is made especially desirable by the fact that under the Federal Reserve Act and under some State statutes considerably less reserves are required if this provision is used. Under ordinary conditions this advance notice of withdrawal is seldom required. In time of stress, however, strict conformity with the requirement would be exacted, in order that the bank might not be embarrassed by lack of money. A stockholder in a national bank, and in most cases in a State bank, is liable in the event of the bank's failure to an amount equal to the par value of his stock.

This provision is for the further protection of the bank's customers.

Customers' Deposits.—Since very little actual money is handled in financial transactions in the United States, the customer's initial deposit in a checking account is likely to be in cheques as well as in cash. After a signature card has been filed, cheques may be drawn at once against the cash on deposit. On a cheque immediately drawn against a deposited cheque, payment would probably be refused, since the deposited cheque might be irregular, the drawer might have died or failed, or the account might be short. When collection has been made on the deposited cheque, cheques will be honoured against the account. A bank is bound to honour cheques drawn on it by a depositor if it has sufficient funds belonging to the customer when the cheque is presented. Where the customer does not keep a balance sufficiently large to compensate the bank for the expense of his account, a service charge is made by many banks. If the customer is a corporation, a partnership, or a fiduciary, the bank will insist on having a certified copy of the resolution or by-law enabling the officers to transact the business of the corporation, or of the partnership agreement, or of the court orders and other legal papers. If a cheque deposited by a customer and credited to his account is not paid upon presentation, the amount is charged back against the customer's account.

When making deposits, the customer should have (a) his bank pass-book, (b) the deposit-slip made out identically with the pass-book, (c) the items arranged in the same order as they are listed on the deposit-slip, (d) the proper certificates relative to income-tax attached to the bond coupons, (e) the cheques properly indorsed. If the customer is an officer of a corporation and presents for deposit to his own account a cheque drawn by him to his own order, many banks will not accept it unless they have the written authorization of the corporation to do so. Some banks make a practice of accepting such deposits and protect themselves by insurance.

To secure payment on a cheque, it must be indorsed by the depositor in one of several ways, by writing on the back of the cheque: (a) In blank, "John Smith." An indorsement in blank is dangerous to the depositor unless he presents it at once at the bank. If it is lost or stolen, the holder can readily cash it. Under no circumstances should a cheque having this indorsement be sent by post; (b) "Pay to the order of Blank National Bank, John Smith." Under this indorsement, if the cheque is lost or stolen, it cannot be negotiated, except through forgery. The customer is fully protected. This is the best indorsement. A cheque having it can be safely sent by post; (c) "Without recourse, John Smith"; (d) "Pay John Jones only, John Smith"; (e) "Pay Blank National bank, for account of John Jones, John Smith." The "third party indorsement" is used widely by partnerships, corporations and associations, in depositing cheques to the account of employes, who may be travelling or away from home, or who for any reason are not in a position to indorse the cheques personally.

Under the law, the holder of cheques is required to deposit them within a "reasonable time"; otherwise, there is danger of the release of indorsers. Furthermore, the cheque holder will be the loser if the bank fails after such "reasonable time." Cheques should be deposited not later than on the first business day succeeding that on which they are received. The customer's money, upon deposit, becomes the property of the bank. The bank admits that it owes the customer that amount, and, in the case of a savings deposit, promises to repay the customer in accordance with the rules in the pass-book in which the customer's deposit is recorded. In the case of a checking account, the bank promises to repay the money immediately upon the presentation of a cheque. In accepting this arrangement, the customer, by implication, agrees to prepare his cheques with care, i.e., to date them, to begin filling in the cheque at the extreme left, and to draw a heavy wave-like line through unused space, to make the figures plainly and close up to the dollar mark, to write clearly, using plenty of ink, and to use either a cheque form prepared by the bank or else a blank cheque. A cheque form of another bank should never be utilized. These safeguards will make fraudulent alteration difficult.

Under the standard form of collection agreement recommended by the American Bankers' Association, when the customer deposits cheques or drafts in a bank on another bank, these cheques or drafts remain the property of the customer until they are collected by the customer's bank, and the customer cannot draw against them until collection has been made. If the cheques or drafts are lost or destroyed, or the bank on which they are drawn fails before they are paid, the customer loses, although he may recover from the person originally drawing the cheques or making the drafts. It is the customer's right to have his cheque cashed in legal tender only, without specifying the kind of money he shall accept. However, the bank is usually willing to pay the customer in whatever kind of money the customer desires, though at times it may decline to pay in gold coin.

At stated intervals, or upon request, the bank returns to the customer his cancelled cheques, together with a statement of his account. If a forged cheque is included, the customer should immediately notify the bank of the forgery and return the cheque to the bank, and the bank is bound to credit the customer's account. If the bank pays a cheque which has been "raised," the bank can charge the customer only the original amount of the cheque, unless it was so carelessly drawn as to lend itself to fraudulent manipulation. If the bank pays a cheque which has a forged indorsement, it is under obligation to reimburse the customer. If the customer does not notify the bank of a "raised" or forged cheque within a reasonable time after the receipt of his cancelled cheques, the bank is not bound to credit him.

A bank certifies a cheque simply as an accommodation and is under no obligation to do so. A certified cheque gives assurance of payment. If the amount on a certified cheque has been "raised," the customer would receive only the amount of the original cheque.

The customer who has drawn a cheque has the right to stop payment. The stop order should give the number, the date and the amount of the cheque, and to whose order it was drawn, and must reach the bank before the cheque is presented for payment. Banks usually require written verification of a telephone stop order. The holder of a stopped cheque can recover against the drawer and indorser if he has purchased the cheque within a reasonable time after date, without notice of any defence. This is by virtue of the special rules applicable to negotiable paper.

The customer desiring to do so may borrow money from the bank on a promissory note, due on a specified date, or may borrow on a demand collateral note. If the customer has collateral, consisting of bonds listed on the stock exchange, his note usually will be discounted or a loan allowed at once by the officers of the bank. If his collateral is in real estate, notes, trade acceptances, or personal indorsement, more time is necessary, in order that the discount committee may pass on the matter. If money is secured on a promissory note, the customer receives in cash the difference between the face value of the note and the interest for the specified time. If a loan is made on a demand collateral note, the customer receives the face value of the note. An interest statement to the customer is made monthly.

As to promissory notes, a customer should remember that (a) a note bears interest before maturity only if so stated, (b) if no mention of interest is made, interest begins on the date the note becomes due and at the legal rate obtaining in that State, (c) notes due on Sunday fall due on Monday, (d) notes due on a holiday, or on Saturday when Saturday is a half holiday, fall due on the next business day. (W. E. AL.)

BANKER MARKS or **MASONS' MARKS**, the marks cut upon the various dressed stones of a masonry building to identify the stone-cutter who prepared the stone, so called from the "banker," or stone bench, at which the stone-cutter works. Banker marks are well-nigh universal in mediaeval buildings in Europe and have been the subject of much archaeological and antiquarian research. It would appear that each stone-cutter had his own individual mark. These were often passed down from father to son. In the 16th century, when others beside working masons were admitted to the lodges of the masonic guilds they, too, received identifying banker marks, which were preserved in

the register of the lodge. Banker marks have completely passed out of use in modern masonry, despite various attempts to resurrect the custom, as in Truro cathedral in England, in 1886.

For a complete discussion see G. F. Fort, *A Historical Treatise on Early Builders' Marks* (Philadelphia, 1885), and *Masons' Marks from Buildings in the Counties of Lancaster and Chester, with Notes on the General History of Masons' Marks* (Historic Society of Lancashire and Cheshire, vol. vii. N.S.), by W. Harry Rylands, F.S.A., may be consulted with advantage. Victor Didron copied some 4,000 banker marks during a tour in France in 1836 and pointed out their value (*Ann. Arch.* 1845).

BANKERS' CLEARING-HOUSE. The working of the cheque system is greatly facilitated by the establishment of a clearing-house which enables bankers readily to adjust their accounts with each other. As long ago as 1775 the London bankers doing business within the City of London arranged a common meeting place in Change Alley where their clerks set off against each other the various cheques and bills which had been presented for payment, thus economizing time and avoiding the risk entailed in collecting money from each other. In 1854 the Joint Stock Banks, after opposition, were admitted to the clearing-house, and ten years later the Bank of England joined the institution.

The system of the clearing-house is exceedingly simple. As each bank has an account at the Bank of England, the daily balances of the clearance are settled by transfers at the central institution. The vast amount of labour saved may be gathered from the fact that the daily clearances of the London Bankers' Clearing-House, including the cheques of country banks which clear through their London correspondents, often amount to as much as £125,000,000. The growth of business at the London Clearing-House in the 41 years 1885-1926 has been as follows:—

Value of cheques, bills of exchange, etc., cleared at the London Bankers' Clearing-House:

	£		£
1885 . . .	5,551,000,000	1915 . . .	13,407,000,000
1895 . . .	7,593,000,000	1920 . . .	39,018,000,000
1900 . . .	8,060,000,000	1925 . . .	40,437,000,000
1905 . . .	12,287,000,000	1926 . . .	39,825,000,000
1910 . . .	14,658,000,000	1927 . . .	41,550,000,000

Provincial clearing-houses have been established in a number of towns, including Manchester, Liverpool, Birmingham, Leeds, Sheffield, Newcastle-on-Tyne, Edinburgh and Glasgow. The cheque system is much more highly developed in Great Britain and the United States than in any other country, but there are bankers' clearing-houses on the continent of Europe at Paris, Berlin, Hamburg and other large banking centres. (See **BANKING AND CREDIT**.)

BANKERS TRUST COMPANY, THE, a United States company organized in 1902 and incorporated in New York State on March 24, 1903, with a capital and surplus of \$1,500,000. It commenced business in New York city on March 30, 1903. In 1909 the capital and surplus was increased to \$7,500,000. In Aug. 1911, the Mercantile Trust company, organized in 1868, and in March, 1912, the Manhattan Trust company, organized in 1871, were acquired by merger. At the close of 1912 capital and surplus amounted to \$20,000,000 and deposits to over \$134,000,000. In April, 1917, the Astor Trust company, formerly the Sixth National Bank, was acquired by merger and became the company's first branch office. In 1920 an office was opened in Paris; in 1921 a second New York uptown office, in 1924 an office in London.

The company does a commercial, foreign and investment banking business and acts as executor and trustee under wills, for individuals, and as depository and trustee under mortgages and trust indentures for corporations. It serves as transfer agent for stocks and bonds, registrar of stocks, bonds and commercial paper, dividend and interest paying agent and depository under reorganization or adjustment agreements. Bankers Company of New York was organized Nov. 1, 1928, to carry on the security business formerly conducted by the Bond Department of Bankers Trust Company. The new company will engage in the underwriting and distribution of government, state, municipal, railroad and public utilities securities in this country and abroad. The company maintains branch offices in 15 principal American cities. Capital

Stock of \$100 par value amounted to \$25,000,000 as of July 2, 1928; surplus and undivided profits were \$75,000,000; deposits \$552,401,755.36 and total assets \$734,425,404.06. (E. S.)

BANKET, a South African mining term, applied to the beds of auriferous conglomerate, chiefly occurring in the Witwatersrand goldfields. The name was given to these beds from their resemblance to a sweetmeat, known in Dutch as "banket," resembling almond hard-bake. The word is the same as "banquet," and is derived ultimately from "bank" or "bench," meaning table-feast, hence applied to any delicacy or to various kinds of confectionery, a use now obsolete in English. See **GOLD**.

BANKHEAD HIGHWAY, a thoroughfare connecting Washington, D.C., with San Diego, Calif., is 3,450m. long. It takes its name from Senator Bankhead of Alabama who was long identified with the good roads movement, having at one time

served as chairman of the U. S. Senate Committee on post offices and post roads. This highway passes through the cotton-milling, textile and manufacturing cities of the New South, and includes points of interest along the Mexican boundary line. Richmond, Petersburg, Atlanta, Birmingham, Memphis, Dallas, El Paso, Tucson and Phoenix are important cities along the route.

BANK HOLIDAYS, in the United Kingdom, those days which by the Bank Holidays Act 1871 are kept as close holidays in all banks in England, Wales, Ireland and Scotland respectively. Before the year 1834, the Bank of England was closed on certain saints' days and anniversaries, about 33 days in all. In 1834 these were reduced to four—Good Friday, May 1, Nov. 1, and Christmas Day. By the act of 1871, the following were constituted bank holidays in England and Ireland—Easter Monday, the Monday in Whitsun week, the first Monday of August, Dec. 26 if a week-day; and by the Bank Holiday (Ireland) Act 1903, March 17 as a special bank holiday for Ireland (see **FEASTS AND FESTIVALS**). In Scotland—New Year's Day, Christmas Day, Good Friday, the 1st Monday of May, the 1st Monday of August, or if Christmas Day and New Year's Day fall on a Sunday, the next Monday following are bank holidays under the Bank Holiday Act 1871. By the same act it was made lawful for the sovereign from time to time, as it should seem fit, to appoint by proclamation, in the same manner as public fasts or days of public thanksgiving, any day to be observed as a bank holiday throughout the United Kingdom or any part of it, or to substitute another day when in any special case it appears inexpedient to the sovereign in council to keep the usual bank holiday. (For further information and for United States see **HOLIDAY**.)

BANKING AND CREDIT. The term "credit" is best understood through its relation to the term debt. Debtor and creditor are correlatives. Debt expresses the relation of the debtor to the creditor; credit, in its simplest use, expresses the relation of the creditor to the debtor. It is therefore another name for debt. This definition supplies a clue to all the various uses of the term. A sale of anything creates a debt from buyer to seller. Payment in ready money extinguishes the debt as soon as it comes into being. If payment is postponed, the debt is allowed to subsist. In that case the sale is said to be on credit, and the seller gives credit. By derivation the term credit expresses the trust reposed by the creditor in the debtor. A man has good credit in proportion as he is trusted as a debtor. The credit of a Government is commonly measured by the price at which its obligations are quoted in the market. A credit instrument is a document by which a debt is assigned from one creditor to another. A bank credit is a debt due from a banker, whether in the form of a deposit, or of a right to draw bills payable at a future date (see **LETTER OF CREDIT**).

FUNCTIONS OF BANKING

A bank is usually thought of as a reliable agency with which money is deposited. This idea is an approximation to the truth, but it is wanting in precision. A bank must be distinguished from a mere depository, one who receives a package of valuables for safe custody and undertakes to return it unopened. Banks do receive valuables on those terms, but that is only a subsidiary function. It is usually jewellery, deeds, securities and similar articles, not money, that they receive. But if a bank does receive a package of money on those terms, that does not constitute a banking transaction. A bank must also be distinguished from a trustee, who receives money and invests it or otherwise uses it according to the terms of his trust, and has to account in detail for everything he has done with it. Banks may undertake to act as trustees, but this again is a subsidiary function.

The services rendered by a bank either as depository or as trustee are not a part of banking. For the sums deposited with it in its capacity as a bank the bank is neither depository nor trustee; it is simply a debtor. For what purpose then does a bank exist? What services does it render in its capacity as debtor to its customers or depositors? The services fall under three main heads:

(1) It provides safekeeping for people's money. This is the same service as is performed by a depository, but it is performed in a different way. Instead of the money being set apart in a strong room, it is replaced by a debt due from the banker. If the solvency and probity of the banker are sufficiently well established, it may be actually safer so.

(2) The bank provides a temporary investment for money, paying interest so long as the money is retained, and repaying the principal on its being claimed in accordance with the contract (usually on an agreed notice being given). This is useful to two classes of people (a) Those whose savings are too small to be dealt with conveniently through the machinery of the investment market or stock exchange; (b) Traders who in the course of business find large sums of money in their hands, but who expect to have to use the money in business again soon.

Savings Banks.—It is for the former class that Savings banks and the savings departments of ordinary banks exist. People of small means want to invest small sums at a time, and they also want to be able to withdraw the sums invested at any time in case they need them. Accordingly a savings bank receives small deposits, and gives the depositors the right of withdrawing their money at short notice. This right of withdrawal is the characteristic of a temporary investment, but in practice the savings bank depositor intends his investment to be permanent, and only to be withdrawn in case of an emergency. Traders on the other hand need a really temporary investment. They want to receive some interest on idle money in the interval before they need it again for employment in business. The right of withdrawal will actually be exercised after a few months or even weeks. The sums deposited will be large, but investment through the Stock Exchange or in mortgages would be inappropriate because it would involve expenses, commission, etc., and a possible loss on realization. When a bank is employed as an agency for temporary investment, it must use the funds entrusted to it to earn interest. The manner in which it does so is described below. (See SAVINGS BANKS)

(3) **Means of Payment.**—A third service performed by a bank, and one which over-shadows the other two, is the provision of a means of payment.

Payment is the process by which a debt is discharged. Money is the means established by law for discharging debts. The debtor has the right to pay his debt in money, and the creditor has the right to require payment in money. But the use of money may not be the most convenient means of payment either to the debtor or to the creditor. And there is an alternative. A debt may be discharged by being set off against another debt. This is quite simple where each of two people is indebted to the other. If A and B are trading together, and A owes B £100, while B owes A £90, they can settle B's debt by deducting it from A's, so that A merely owes B the balance of £10. They may carry forward the balance from account to account, so that money need only be paid in relatively small sums to discharge balances at infrequent intervals.

Payment in Credit Money.—But in general a man's creditors are not the same people as his debtors, and this simple direct system of set-off is not possible. A bank may be regarded as an agency for extending the discharge of debts by set-off to that case. Suppose a group of people indebted to one another. If the creditors assign their rights to a banker, he becomes the debtor of all the creditors and the creditor of all the debtors. Each man's debts can then be deducted in the banker's books from his credits, leaving a net balance. Some people's debts will exceed their credits, and for them the net balances will be debit balances. If it were desired to complete the settlement at a particular moment so that all debts are discharged, those with debit balances would have to pay the amount due to the banker, and he would distribute the amount received among the creditors. If all the debtors paid up, all would then be quits.

The Bank's Assets and Liabilities.—But people do not want money except as a means of payment. For the major payments a transfer in a bank's books is a more convenient means than money. Consequently the creditors prefer not to have their credits paid off in money. They prefer to hold balances of bank credit or credit money, that is to say, debts due from the banker, which can be used as a means of payment. If the banker is solvent, he must hold equivalent assets against his liabilities. These are provided by the debtors. It is not necessary that the debtors should pay in money. The banker may consent to let a customer remain indebted for an agreed period and pay interest on the amount. Or the banker may buy investments and himself become indebted for their value. The sellers of the investments acquire equivalent bank credits which when spent will pass into other people's hands. Any one who would otherwise be indebted to the banker can extinguish his indebtedness if he can acquire a share of these bank credits by selling something. There being a persisting demand for bank credit as a means of payment, the banker can remain continuously indebted to his customers for sums equal to the working balances that they find it convenient to hold available to be drawn upon for the payments they must make from day to day. Any one customer's balance will fluctuate widely, but the aggregate of all balances will be comparatively stable.

BANK-NOTES AND CHEQUES

In order that bank credit may be used as a means of payment, it is quite clearly essential that some convenient procedure should be instituted for assigning a banker's debt from one creditor to another. In the infancy of deposit banking in mediaeval Venice, when a depositor wanted to transfer a sum to someone else, both had to attend at the bank in person. In modern times the legal doctrine of negotiable instruments has been developed, and the assignment of a debt can be readily effected by the delivery of a document from the old creditor to the new, provided that the contract with the debtor (the banker) contemplates this being done. The document may take either of two forms: (1) a cheque, or the creditor's order to the banker to pay; (2) a note or the banker's promise to pay.

Bank-notes.—Historically the bank-note came first. It may be regarded as the creditor's title deed of a debt due from a banker. The rights it represents are assigned by simple delivery; the bearer of the note for the time being is *ipso facto* the creditor of the bank. Payment in bank-notes is therefore effected in exactly the same way as payment in money. Payment of large sums in coin is inconvenient; the coins must not only be counted but scrutinized to see that none of them are counterfeit, or unduly worn, etc., and the expense of handling and transporting considerable quantities of the precious metals is serious. By the use of bank-notes of large denomination the labour of counting is reduced to a trifle, and the rest of the trouble is avoided altogether.

Cheques.—A note is issued by the banker when he has to make a payment to someone (e.g., a depositor or a borrower) who is willing to accept it in that form. A cheque on the other hand is made out by his customer on the occasion of the payment to be effected by it. The bank-note is for a round sum, the cheque for the exact sum to be paid. The bank-note circulates from hand to hand like money, and may be held by people who have no direct

dealings with the issuing bank. The cheque is delivered to the person to whom payment is to be made and is in general thereupon presented to the bank and cancelled after the single payment it was designed to discharge. A cheque can only be drawn by a creditor of the bank, a depositor. And his deposit must be of the kind payable on demand (on current account). He cannot draw a cheque on a deposit payable only after notice or at an agreed future date (a temporary investment). If he wishes to use such a deposit as a means of payment, he must first give the requisite notice or agree with the banker terms on which the notice is to be dispensed with. Deposits subject to notice are sometimes called time deposits. Sometimes the term deposit is treated as belonging specially to them as distinct from balances on current account. Nevertheless the latter are very commonly described as demand deposits, and the word, deposits, itself used to include both. For the largest payments the cheque is distinctly more convenient than the bank-note.

THE CLEARING SYSTEM

Bank Clearing.—If a number of people who are all customers of the same bank pay one another with cheques, their debts are set off against their credits in the books of the bank. But if there are several banks, the process of set-off is more complicated. Each bank will receive some cheques drawn in favour of its own depositors by those of other banks. It will credit its own depositors with the amounts of these cheques conditionally on the banks on which the cheques are drawn paying them. It will sort out the cheques and present to each bank those drawn on it. But all the other banks will be following the same procedure; every bank will be both debtor and creditor. To settle between any two, it is not necessary for each to pay the gross amount due to the other. They can set off debts and credits, and leave a net balance to be paid by one to the other. The process of set-off can be further developed and simplified by the creation of a central organization called a clearing-house. Instead of each bank presenting its claims to each of the others separately, each bank presents all its claims to the clearing-house. The clearing-house is then in a position to set off all the debts and credits of any one bank. If the bank is on balance a debtor it pays the net amount to the clearing-house; if it is on balance a creditor it receives the net amount from the clearing-house. The receipts and payments of the clearing-house balance exactly.

Clearing Agents and Correspondents.—In a place which is a clearing centre all the banks will not necessarily be members of the clearing-house. But those which are not members cannot easily dispense with its facilities; they will probably make arrangements with the banks which are members to act as their agents. A clearing bank which undertakes to act as agent for one or more non-members can deal with their cheques along with its own, keeping a separate account for each. They must then make arrangements to pay or receive the net balance disclosed every day after the process of set-off is completed. This arrangement can also be made for banks at a distance from the clearing centre. Clearing requires the personal presence in one room of representatives of all the clearing banks and a bank with no establishment (whether head office or branch) at the clearing centre cannot take part in it except through the agency of one of the banks carrying on business there. The outlying bank will probably arrange for the clearing bank to be its correspondent; it becomes a depositor in the correspondent bank, and maintains a balance on current account from which it can meet its clearing liabilities, and to which it can credit its receipts. In a country like the United States, where branch-banking is greatly restricted, this relation of the outlying bank to its correspondent at the clearing centre plays a great part in banking organization. There are intermediate clearing centres at which the banks, while acting as clearing agents or correspondents of the outlying banks of the district, themselves rely on correspondents at the greater centres.

Central Banks.—In every country there tends to be a single ultimate clearing centre to which the residue of cheques not cleared locally will gravitate. One of the primary functions of a modern central bank is to hold deposits from the clearing banks,

with which they settle their clearing balances. The London clearing banks settle with cheques on the Bank of England. Clearing facilities form one of the principal features of the Federal Reserve Banks of the United States.

Clearing of Bank-notes.—At the present day clearing is chiefly concerned with cheques. But the same machinery is applicable to bank-notes, and is often applied in communities where there are several note-issuing banks. Each bank presents to the note-clearing house the notes of other banks which it has received in the course of business, and its claims are set against its liabilities in respect of its own notes held by the other banks.

Payments in Money.—By means of the clearing system payments that people are willing to make with bank credit, can be carried right through to ultimate settlement without the use of money. On the other hand there are classes of payments for which bank credit is a less convenient medium than money, that is to say (1) payments to or by people (usually of small resources) who have no banking accounts, and (2) the smaller payments (e.g., to shops, places of entertainment, railways, trams, etc.) of those who have banking accounts. Employers of labour regularly draw out money from the banks to pay wages, and all people with banking accounts draw sums out for use as pocket-money. The banks must be prepared to meet these demands. They are the debtors of their depositors, and like all debtors are bound to pay, if so required, in money. To a great extent the money they pay out returns to them.

Localization of Bank Deposits.—It is these transactions in money that make the place at which the bank undertakes to pay its depositors a matter of practical concern. If all payments were made in bank credit, the cheques and notes with which they were made would in any case all go to the clearing centre, wherever they might be presented. But one who has to make payments in money will want to keep his deposits with a bank or a branch bank in close proximity to the place where he resides or carries on business. One who has deposited money in a bank expects to find the money, when he needs it, at the place where he left it. In reality the money itself has become the unencumbered property of the bank, and the rights of the depositor to it have been replaced by his rights as a creditor against the bank. Nevertheless it is an understood condition of the contract between them that the bank's debt shall be paid in money on demand (or after notice when that is stipulated) at the place at which the account is kept.

BANK ASSETS

Need for Cash Reserve.—A bank is the debtor of its depositors. Against its debts it must hold equivalent assets. Against deposits received for temporary investment, on which the bank pays interest, it must hold interest-bearing investments. Against deposits held by its customers for use as a means of payment it can also in part hold interest-bearing investments. But in its choice of assets to be held against these latter it is limited by the character of its obligations. It must be ready at all times (1) to pay out money on demand (2) to meet an adverse balance at the clearing. The bank must keep a part of its assets in actual money, or cash reserve. Idle cash earns no interest, and a bank run for profit will seek to keep down its cash reserve to the minimum required by safety. In ordinary circumstances it can rely on the demands of its depositors for money keeping within narrow limits. People determine the amount of money they keep in hand by considerations of convenience, and these considerations are not subject to arbitrary and discontinuous changes. People need more cash when they go on holidays or when they travel, and there are seasonal variations in the demands on the banks for money for these purposes. But these are in general easily foreseen and provided for. Money is drawn out for innumerable small payments, and the amount in circulation at any moment is the aggregate of innumerable small balances. This aggregate exhibits the steadying effect of the law of averages. But the aggregate of balances of credit money, that is to say, of bank deposits, is on a different footing. The number of depositors is comparatively restricted, and it is likely that among them will be a small number of people carrying on business on

a large scale, whose balances form a disproportionately large part of the total, and who hold large balances because they frequently make very large payments. The law of averages will not apply here. The bank must be prepared to settle through the clearing-house widely fluctuating balances the extent of which cannot be foreseen. A clearing bank may rely for this purpose on reserves of cash. Or if the practice is to settle with cheques on a central bank, it may rely on balances deposited with that bank. But, like cash reserves, balances deposited with the central bank yield no interest.

Liquid Investments.—In order to keep their unprofitable assets down to a minimum, and yet to be sure of meeting all demands, whether for money or for payments through the clearing-house, without difficulty or delay, banks make a practice of holding a considerable part of their assets in the form of what are called liquid investments. Liquid investments are those which can be turned quickly and without loss into money. They may be either (1) short-dated investments, that is to say, debts maturing for payment in a short time or on short notice being given, or (2) securities readily saleable in the market

SHORT-DATED INVESTMENTS

Advances to Traders.—Short-dated investments are possible because it suits the convenience of certain classes of people to borrow temporarily. That is especially true of traders who produce or buy commodities with a view to sale. Usually a trader either buys or sells goods in large quantities at a time; if he is a wholesale dealer he both buys and sells in large quantities. If all the goods he buys are paid for out of his own capital, he must always hold a large balance of idle cash just before a large purchase or after a large sale. While these balances are accumulating or being disposed of, there is a loss of interest. Balances can be kept down and the loss of interest reduced to a minimum, if, instead of accumulating cash, the trader can borrow the sum required for his outlay and repay the debt out of subsequent receipts. If he possesses plenty of capital of his own, he can find profitable permanent investments for the resources released from his own business, so that all his capital will be earning interest, while he will only have to pay interest on the fluctuating amount of temporary indebtedness outstanding. And the trader whose business is capable of expansion beyond the limits of his own capital, can supplement that capital by temporary borrowing and take better advantage of his opportunities. Loans to traders of this type form the principal bankers' investment. But the degree of liquidity varies greatly. The banker reserves to himself the right to call in the advance at any time on demand or on short notice. But it may be highly embarrassing to the trader to pay up, and the banker cannot in practice wholly disinterest himself in his customer's affairs. The trader, if he had superfluous cash in hand, would in any case desire to pay. If he has not, he can only obtain the means of paying either (1) by borrowing from someone else, or (2) by selling something. It may be extremely inconvenient to sell. Even if he possesses goods ready in all respects for market, it may still only be possible to hasten his sales at a sacrifice (possibly a heavy sacrifice) in price. Forced sales might even make the trader bankrupt. On the other hand, if under pressure the trader borrows from someone else, the new lender will probably be another banker, and the result may be that the first banker will lose the trader's custom. The upshot is that advances to traders are apt to be wanting in liquidity unless either (1) the trader is one who deals in a very active market with a rapid turnover, so that in any case he repays his advances and reborrows them at short intervals, or he holds a certain amount of capital outside his own business invested in readily marketable securities.

Loans to the Stock Exchange.—Dealers in the investment market (stock brokers and jobbers) are a particular class of traders who are well placed to borrow from banks. Stocks and shares of the kind they deal in are likely to be more readily marketable than commodities. A slight sacrifice in price will often elicit purchases from investors in anticipation of future savings, whereas the consumer's demand for commodities can-

not be stimulated to any important extent in this way. The investment market is active, dealers are accustomed to borrow for short periods, and under normal market conditions can readily be induced to curtail their indebtedness.

Bills of Exchange.—But the banker's favourite liquid investment is the bill of exchange. A bill of exchange is an instrument for assigning a debt; it takes the form of a written order from the creditor (the drawer) to the debtor (the drawee) to pay the debt to a third person (the payee), who, on the debtor signifying his assent (acceptance), becomes the new creditor. Thus a seller of goods may draw a bill upon the buyer in favour of his banker, payable at an agreed future date. He is thereby enabled to sell the debt to the banker, who will pay the present value of the debt, that is to say the sum due, less interest for the period up to maturity. This interest (discount) makes the holding of the bill a profitable investment to the banker. The bill has several incidental advantages. (1) The bill is regarded as guaranteed by both the drawer and (after acceptance) the drawee. (2) The bill is saleable; the bank can assign its rights in it, if need be, to another creditor. (3) The drawee is expected to provide at all costs for punctual payment on maturity. The bill in fact is subject to the law of negotiable instruments, with all the venerable traditions handed down from the law merchant. The personal relation which modifies the legal rights of the banker in the case of a direct advance to his customer is eliminated from the bill, because the bill is designed to be marketable. The customer has no right to complain if the bill is sold and passes into the hands of strangers who know and care nothing for his affairs, and who will not listen to excuses, before enforcing their rights. In general the relation of banker and customer exists between the payee and the drawer, not between the payee and the drawee or acceptor, who is the debtor. In practice the drawee is often another bank. Banks are accustomed (at the charge of a small commission) to allow bills to be drawn on them on behalf of their customers. The bank assumes all the responsibilities of the acceptor; the customer, who is the ultimate debtor, undertakes to pay the sum due on the maturity of the bill to the accepting bank, but assumes no other obligation.

Promissory Notes.—Another form of negotiable instrument is the promissory note. If a borrower from a bank gives the bank a note promising to pay the sum at the date it is to fall due, the bank can, if need be, sell the note before maturity, just like a bill. But the note differs from the bill in having (in the first instance) no second signature upon it as a guarantee. It also differs in that, in general, the note is the direct obligation of a customer of the bank that holds it, and while so held does not escape altogether from the influence of the personal relation of banker and customer. The banker is not in practice so free to harden his heart as when he holds a bill drawn on a stranger.

MARKETABLE SECURITIES

The Discount Market.—The bill of exchange possesses both the special attributes of liquidity. Not only is it a genuinely short-dated security with safeguards for prompt payment at maturity, but it is also marketable. Banks can sell bills to one another, and when a bank has to make large and unforeseen payments, its holding of bills forms a secondary reserve behind its cash. There are degrees of marketability. The facilities for dealing in bills of exchange in any centre are not necessarily adequate to meet the requirements of banks. The most highly organized market in bills is to be found in the London discount market or money market. Here there is a class of dealers, the discount houses, specializing in the buying and selling of bills. They not only act as intermediaries between the banks which want to sell bills and those which want to buy, but they buy and hold bills on their own account. To provide funds for this purpose, they borrow money from day to day, at call, from the banks and other lenders with free balances. It is the dealing in this day-to-day money that constitutes the money market properly so called.

Rediscounts.—To the banks the loans to the discount market represent their most liquid asset. The borrowers are dealers in the most liquid of all securities, the bill of exchange. But that

is not the whole story. It happens from time to time that the volume of bills coming into the London market for sale is excessive in relation to the capacity of the banks to absorb them. If the market were left entirely to itself the effort to dispose of the bills might result in the rate of discount and the rate of interest on day to day money being forced up to an exorbitant level. But the Bank of England intervenes on such occasions, and stands ready to lend to the discount houses or buy bills from them at a specified rate (bank rate). In other countries, where no counterpart of the London discount market exists, substantially the same result is secured by the presence of a central bank which undertakes to buy or rediscount bills for the other banks. There is a market in bills because the central bank is always a willing buyer at its own price (bank rate). The functions of a central bank are further explained below and in the article **CENTRAL BANKS**.

The Investment Market.—Marketable securities include those dealt in on the investment market or stock exchange, that is to say stocks and shares, debentures and bonds, etc. Securities of these kinds are not all marketable. The less well known cannot be sold in the open market at all, or, if they can, it may be only after delay in finding a buyer and with a substantial sacrifice of price. But the securities which really are marketable form under normal conditions a liquid investment. Occasionally it may happen that the investment market breaks down; demand fails, and the market cannot be made to absorb even first rate securities except at a relatively very low price. Here, as in the case of a breakdown of the discount market, it is possible for the central bank to relieve the strain; it can offer to lend to the other banks on stock exchange securities. But central banks are usually less willing to make this kind of loan than to rediscount bills. Bills have both forms of liquidity, being both short-dated and marketable. Stock exchange securities are only marketable. If the capital sums they represent are repayable at all it is only at a distant date.

SOLVENCY

Liquidity is a special need of banks. Solvency is a requirement common to them and to all other enterprises. But the conditions of solvency of a bank are in certain respects peculiar. A trader's debts are incidental to his business, and ought to be moderate in proportion to his own capital. A banker's debts are the very basis of his business. Moreover if his debts are to be used by his customers without hesitation as the means of payment, the equivalent of money, the banker's solvency ought to be put beyond question. He ought not to take risks.

Short-dated Securities.—Against liabilities fixed in terms of money, he ought not to hold assets of which the money value is susceptible of wide variation. The money value of commodities, of shares and of long-dated securities is liable to heavy and unforeseen depreciation. The only assets secure against such depreciation are short-dated investments. That does not mean that a banker is to limit himself absolutely to bills, and to advances for periods not exceeding a few months. Bonds maturing in a moderate period of years are not liable to more than a slight degree of depreciation.

Collateral Security.—To some borrowers banks are willing to make advances unsecured, their wealth and standing being such that no doubt is felt as to all their obligations being fully and punctually met. Where this is not so, the bank will require collateral security. The nature of the security depends on the circumstances. When a merchant borrows to buy commodities which are to be sold again without going through any productive process, it is usually possible to give the bank a lien on the commodities till they are sold. When a producer borrows to meet the cost of wages, etc., the products in which his expenditure is to be embodied have no separate existence when the loan is made. In that case sometimes the fixed capital of the concern can be pledged, debentures or a mortgage being handed to the banker and returned by him on repayment. Sometimes a trader possesses investments outside his business which he can pledge. If they are gilt-edged or readily marketable securities, the banker will prefer them to a lien on commodities or on fixed plant. A

dealer in the investment market can provide security without difficulty, because when he borrows it is to buy marketable stocks and shares which can easily be pledged. This system of requiring collateral security for bank advances has other advantages besides safeguarding the lending bank against ultimate loss. The advance is never granted up to the whole value of the security. Some margin is required. Consequently the borrower is compelled to use a certain proportion of his own capital in his business; he cannot work entirely with borrowed money. This prevents the abuse commonly called over-trading, the assumption of heavy commitments by a man who has comparatively little or nothing to lose. For bills collateral security is less necessary than for advances. The liability of the acceptor is supported by the guarantee of the drawer and of all the endorsers. Nevertheless where the names on the bill are not of first rate credit, collateral security is required. When a bill is drawn by an exporter in one place on an importer in another, and is bought in the former place by a bank before it has been sent to the latter to be accepted, it is a common practice to give security to the bill by attaching to it the bills of lading which constitute the title deeds to the goods while in transit. The bank is thereby given legal possession of the goods in the interval before acceptance.

Bank Capital.—By these methods risk can be minimized, but it is not in the nature of human affairs that it should be eliminated from the banker's business altogether. To provide for losses, the banker must have some capital of his own, a margin of his total assets over his total liabilities. This margin may be regarded as a guarantee fund. It may be increased by the accumulation of a reserve or surplus out of profits. A banker need not be so strict in the selection of investments for his capital and surplus as for his deposits. And the bigger the margin in proportion to his demand obligations, the freer he is. Banks on the continent of Europe are much less restricted in their investments than those in England or America. They regularly participate in issues of shares in industrial companies, though the shares are not likely to be marketable at any rate in the first instance, and they may result in loss. But these banks have relatively large capital in proportion to deposits. And the larger the capital in proportion to deposits, the less need is there for strictness in the selection even of investments to be held against the deposits themselves. The need for liquidity indeed is unaffected, but given an adequate proportion of liquid assets, a greater risk of loss can be incurred on the remainder without endangering the solvency of the bank. Risk in business, it will be remembered, is a means of profit. In countries where the commercial and financial business which needs short-term advances and discounts from banks is not very extensively developed, the tendency is for banks to be relatively highly capitalized and to assume a different character. They do a large business in shares, mortgages and long-term investments, and play a leading part in the investment market.

FOREIGN EXCHANGE

A clearing system is only possible where the debts to be cleared are expressed in the same monetary unit. Otherwise they cannot be set off against one another. The need for clearing is felt in international transactions where this condition is not fulfilled. The requisite facilities are created through the instrumentality of the foreign exchange market. At any centre where a foreign exchange market exists, the dealers who constitute this market offer to buy and sell bank credits in foreign countries. They quote prices for the currencies of these foreign countries in terms of the currency of the place where they are dealing. These prices permit of the set-off of debts expressed in the currencies and they form the basis of what is in effect a system of clearing. The dealers are for the most part banks. In order that a bank at any centre (A) may deal in foreign exchange between that and another centre (B), it must have some sort of establishment at the foreign centre (B), either a branch or a correspondent bank. In either case it will have a supply of liquid assets localized in (B) and expressed in its currency. If it has a branch, the assets will be in the form of bills, marketable securities, advances and cash; if it has a correspondent, it will maintain a deposit with the

correspondent. In the course of business the bank's customers in (A) will want to buy and sell credits at (B). Some will have acquired pecuniary rights there and will bring the cheques, bills or other credit instruments, by means of which such rights are assigned to be bought by the bank, and others, seeking to acquire similar rights, will want the bank to sell them the appropriate credit instruments. The bank will draw upon its resources at (B) to sell to the latter, and will replenish them with the credits bought from the former. Its purchases and sales will not exactly balance; there will be excess of one or the other. But meanwhile the other banks at (A) will be dealing in exchange upon (B), and it is probable that some will have an excess of purchases and others an excess of sales. All will want to avoid any greater disturbance of the amount of liquid assets held at (B) than is necessary. Through the channel of the foreign exchange market those whose holdings at (B) have increased can sell the surplus and those whose holdings have been reduced can buy enough to make up the deficiency. This is a process analogous to clearing, but in general it will leave a residue, an increase or decrease in the aggregate holdings at (B) of all the banks at (A). But other foreign centres will have been dealing in exchange on (B), and the banks at each centre will have a residual balance, an increase or decrease in the aggregate holdings of its banks at (B). At any centre where the holdings have increased, the foreign exchange market will tend to quote a lower price for the currency of (B), and at any centre where the holdings have decreased, the market will tend to quote a higher price. But these divergencies of price will quickly lead to those centres which have an excess of liquid assets at (B) selling them to those which have a deficiency. Here we have a further stage in the process of clearing, but there will still be a residual balance, and an excess or deficiency of liquid assets in (B) held among the banks dealing in foreign exchange all over the world. The existence of this residual balance will affect the quotations of the currency of (B) in the foreign exchange market in terms of all other currencies; an excess will lower the value of the currency, and a deficiency will raise it.

CREDIT POLICY

Banks create credit. It is a mistake to suppose that bank credit is created to any important extent by the payment of money into the banks. Money is always being paid in by tradesmen and others who receive it in the course of business, and drawn out again by employers to pay wages and by depositors in general for use as pocket money. But the change of money into credit money and of credit money back into money does not alter the total amount of the means of payment in the hands of the community. When a bank lends, by granting an advance or discounting a bill, the effect is different. Two debts are created; the trader who borrows becomes indebted to the bank at a future date, and the bank becomes immediately indebted to the trader. The bank's debt is a means of payment; it is credit money. It is a clear addition to the amount of the means of payment in the community. The bank does not lend money. The borrower can, if he pleases, take out the whole amount of the loan in money. He is in that respect in the same position as any other depositor. But like other depositors he is likely in practice to use credit for all major payments and only to draw out money as and when needed for minor payments.

Credit Limits.—The statement that banks create credit has been the occasion of much unnecessary controversy. It does not mean that any bank can create any amount of credit at its sole discretion without limit. There are limits, and neither the theory nor the practice of banking can be fully understood without regard to those limits. When a bank lends to its customers it increases its deposit liabilities. To the customers those liabilities are money, the means of payment. They draw upon their balances and pay them away. The people to whom they make payments will be average members of the community. In so far as they have banking accounts they will be for the most part with other banks, and the payments to them will appear as debits against the lending bank at the clearing. At the same time previous advances and bills will be maturing. The customers of

the bank who pay them off will have procured the wherewithal by selling things and doing business with other members of the community; they receive payment, and thereby there arise credits in favour of the bank at the clearing. If the bank increases its lending, the tendency will be for the debits at the clearing to exceed the credits. The bank's cash will be diminished, and to reinforce its reserves it must realize some of its liquid assets. To that extent it loses the profit on its additional lending, and at the same time its position will be weakened. On the other hand, if all the banks in the community are increasing their lending to the same proportional extent, no one of them will lose at the clearing, and this check upon them will be inoperative. But there is another check. The payments made by the borrowers out of the credit money placed at their disposal include payments to wage-earners and others who have no banking facilities. In so far as these people spend what they receive, the money comes back to the banks and there is no loss of cash. But the presumption is that when the outflow of money is increased, some will remain out; the cash holdings of the community will grow, and the cash holdings of the banks will be reduced.

Cash Holdings.—Now the banks must hold a certain amount of cash, corresponding to their deposit liabilities. Unless at the outset their cash holdings are redundant, they cannot let them be reduced. Indeed if, as we have assumed, their deposit liabilities are increasing, they would rather want their cash to increase in proportion. Banks commonly aim at keeping their cash approximately in a fixed ratio to their liabilities. Any bank which seeks to make good its lack of cash can do so at the expense of the other banks by damping down its lending. It will secure a credit balance at the clearing, and will receive this balance either in money or in cheques upon the central bank which can be turned into money. If one bank replenishes its reserves at the expense of the others, they will feel the shortage all the more. All will soon be impelled to curtail their lending, or, as it is called, to contract credit. But there is an alternative. If there is a central bank the other banks (which we may call the competitive banks) can replenish their cash by borrowing from it. If (as is invariably the case) the central bank is a note-issuing bank, and its notes are either legal tender or are treated by the community as entirely equivalent to money, the central bank by lending creates money. If its assets are increased by a certain amount of new loans or discounts, its liabilities are increased by the same amount. Its liabilities are either notes, and therefore money, or deposits which can be drawn on for clearing purposes or converted into money and which are regarded by the competitive banks as part of their cash reserves.

Power of Central Bank.—The central bank has the power of removing the obstacle interposed by the limitation of the supply of cash to the indefinite expansion of credit by the competitive banks. This power it ought to be cautious in using. The instrument through which it regulates its lending is the bank rate, the rate of interest that it charges. As a rule the bank rate properly so called is the rate of discount charged by the central bank on bills, another and somewhat higher rate being charged for advances. The accepted practice of central banks is to lend to all comers, provided they bring the approved kinds of bills or securities, and, if they seem to be borrowing too much, to rely on a high bank rate to deter them. It occasionally happens in exceptional circumstances that the central bank refuses to lend at all, or rations borrowers, refusing to lend beyond a prescribed limit. That is an emergency measure, only appropriate at a time when under the influence of a tendency towards inflation there is a class of speculative borrowers unamenable to any rate of interest short of one which to other and more reasonable borrowers would seem extortionate. Far from being advisable in other emergencies, a refusal to lend is disastrous in a financial crisis. A crisis is caused by a collapse of prices, which threatens the solvency of traders who are holding stocks of goods with borrowed money. It is likely to occur at a time when there has been excessive lending and the competitive banks are calling in loans. To refuse a loan is to compel a sale, and forced sales accentuate the fall of prices. If the competitive banks can bor-

row (at a price) from the central bank, they can afford to grant or renew loans (at a price) to their customers, and forced sales, at any rate on the part of solvent traders, can be avoided without undue difficulty.

Bank Rate and Rates of Interest.—Under normal conditions, when there is no crisis, the bank rate sets the standard for short-term rates of interest throughout the market. The extent to which the competitive banks borrow from the central bank is governed by the extent of their own customers' borrowing from them. If bank rate is to affect the competitive banks' demands, it can only be through their customers. If the market rate moves with the bank rate, that occurs; traders borrow less if they have to pay more. Some traders, it is true, are little affected by the rate of interest on temporary loans; it is a negligible item in the calculations of a producer with big fixed capital which he cannot afford to leave idle. But others are highly sensitive to it; particularly the merchant who makes a narrow margin of profit on a large turnover of goods, and who can vary his stock in trade within wide limits without inconvenience. The effect of bank rate on the market depends on the extent to which the competitive banks are compelled actually to borrow from the central bank. The central bank may hold securities bought in the open market. To support a given total of liabilities (note-issue and deposits), the more of these open market assets it holds, the less the competitive banks will need to borrow. The open market assets might be raised to such a figure that the competitive banks need not borrow at all. In that case the market rate would for the time being be dissociated from the bank rate; bank rate would be ineffective. To make it effective, the central bank would have to reduce its open market assets (by sale or non-renewal). Its liabilities would fall by the same amount as its assets, and there would be a shortage of cash which would drive the competitive banks to borrow.

Influence of Banks to Deter Borrowing.—When the competitive banks are subjected to pressure by the central bank, they do not rely only on high interest charges to deter their customers from borrowing. They can exercise influence upon them in many other ways, by conditions as to security, by limiting the period of a loan or by simple persuasion. It is when they are more than usually indebted to the central bank that they are likely to make most use of these methods. It was pointed out above that in London the borrowing from the Bank of England is done not by the competitive banks but by the discount houses. But that does not alter the essential character of the system of credit control.

Central Bank Regulation of Credit.—The central bank by adjusting bank rate, and when necessary making it effective, absolutely dominates the credit market. How is it to use this power? One answer (but as will be seen, an incomplete one) is that it is guided by the state of the foreign exchange market. If one among several countries creates credit too freely, the effect is much the same as when one among several banks does so. The borrowers pay away the deposits they acquire, and a part they pay away to international markets for imported goods, etc. The outcome is what may be regarded as a debit clearing balance against the country in the foreign exchange market. The dealers in that market receive too much of its currency. Either the adverse balance must be settled by exports of gold (which plays the part among gold standard countries of an international currency) or the currency of the country will tend to depreciate in terms of other currencies in the foreign exchange market. It is the practice of central banks to aim at preventing this situation from arising. An expansion of credit that threatens to disturb the foreign exchange market they check by raising bank rate. The contrary case where credit contracts, and the currency appreciates in the foreign exchange market, they deal with by a reduction of bank rate. But this manner of proceeding is open to the objection that if all the countries expand credit simultaneously, no one of them will have to pay a balance to any other. At this point the theory of banking merges in the theory of money and a further explanation of this somewhat intricate subject is given in the article MONEY.

DISTRUST, RUNS AND SUSPENSIONS

A great part (probably the greater part) of a bank's liabilities will be payable on demand. No bank keeps enough cash to pay all its demand obligations. It is unlikely that cash and liquid investments together would suffice. Supposing all its customers simultaneously exercised their rights of withdrawing deposits on demand in money, the bank, if left to its own resources, would probably be unable to fulfil its obligations. In general this does not occur. People deposit their money in banks on grounds of convenience, and, so long as the balance of convenience remains, they continue to do so. But a vital condition is that they should feel confidence in the bank. Let them doubt its solvency, and they will immediately demand payment. If something occurs to cast doubt on the solvency of a bank, there will be a *run* upon it, a simultaneous (possibly panic-stricken) withdrawal of deposits by all or by a large proportion of its customers. The bank's first resource is to turn its liquid assets into money. It must sell them or borrow upon them from other banks. One of the advantages of the central bank system is that the central bank is at hand to afford help to a bank in difficulties. Provided the bank's position is demonstrably sound, the central bank can lend it whatever cash may be necessary to satisfy its depositors. But if that condition is not fulfilled, the bank may find its cash reserves exhausted and be compelled to suspend payment. Suspension is not quite the same thing as failure. But it is a breach of the understanding on which credit has been created to serve as a means of payment. For it stops not only the withdrawal of deposits in money, but also the clearing of cheques drawn by the depositors. Legally it is not possible to enforce payment on demand, since a court would always give reasonable time for payment (though damages might be given for a default on an obligation to pay on demand). Banks have often been compelled to suspend payment when they are perfectly solvent in the sense that their assets, when realised, have paid all their depositors and left something over for the shareholders. Suspension can arise in another way. A country with a gold standard currency may be exposed to an adverse balance of payments and heavy losses of gold, so that all the banks simultaneously experience a rapid depletion of their cash not owing to distrust, but because a profit can be gained on exports of gold. If the currency laws are such that the money withdrawn cannot be replaced with fresh supplies (e.g., by increased issues of notes from the central bank), there may be a general suspension of payments by the banks.

BANKING ORGANIZATION

Branch Banking.—The establishment of branches enables one bank to do business over a wide area. It thereby becomes possible for the whole of the banking business of a great country to be concentrated in the hands of a small number of banks. Branches give better facilities for payments between one place and another. If such payments have to be made through correspondents a charge will probably be made in the form of a small (but vexatious) commission. Mere magnitude is itself an advantage to a bank. The bigger the bank, the more effectively the law of averages applies to its transactions and in particular to its losses. If the losses to be guarded against are a smaller proportion of the total assets, then a smaller proportion of capital will give the same security to depositors, or a given proportion of capital will give greater security. In the United States, where branch banking is prohibited except on a very restricted scale, hundreds of little banks fail every year. The big bank can also give better facilities to the big customer. A trader whose balances and borrowings are considerable in proportion to the total resources of the bank is difficult to deal with. His transactions may sometimes upset all the banker's calculations. But if the trader can find a banker who has many customers doing business on the same big scale, their transactions will become subject to the law of averages. The result is a tendency for the big banks to absorb the little ones, or for many little banks to combine and form a few big ones where-ever branch banking is permitted. The process has gone farther in England than anywhere else, and it has come to be recognized that it ought not to proceed indefinitely. There is no apparent

stopping place short of the union of all banks into a single monopoly. Such a monopoly could hardly be left in private hands and the result would be the nationalization of banking.

Nationalization of Banking.—The nationalization of banking in its entirety is a policy closely associated with Socialism or Collectivism. It is a feature of Communism, as established in Russia. A nationalized central bank, or State bank, on the other hand is an institution quite in harmony with an individualist or competitive economic system. A central bank is in any case a public institution. When it is the property of private shareholders, who have subscribed the capital, as is usually the case, it still must be carried on with a view rather to the public interest than to profit. The State is usually given some footing in the management, e.g., by appointing a governor or at any rate some of the directors. The Bank of England is an exception. Its governor and directors are solely dependent on the shareholders and responsible to them.

VARIETIES OF BANKS

The foregoing description is applicable to the ordinary bank of discount and deposit, which combines the functions (1) of supplying credit money as a means of payment (current accounts); (2) of giving facilities for the temporary investment of balances (deposits subject to notice); and (3) of short-term lending. But there are other activities, more or less closely related to these, which are undertaken by banks, and some concerns which specialize in these other activities are commonly given the name of bank.

Acceptances.—It was mentioned above that banks allow their customers to arrange for bills of exchange to be drawn on them. The customer, when he buys goods, can tell the seller to draw a bill on the bank, and the bank will accept the bill. A bill accepted by a bank can be discounted on more favourable terms than one accepted by an ordinary trader. It should be borne in mind that the bill will be drawn by the seller of the goods and will be discounted by the seller's bank; the buyer's bank will only see it when it is presented for acceptance and later on for payment. There is nothing to prevent a bank buying its own acceptances if offered in the market, but banks do not make a practice of doing so. On any bill which a bank has accepted it is the principal debtor, and it shows its acceptances in its balance-sheet among its liabilities. On the credit side the bank shows an exactly equal sum, being the liability of its customers to provide the means of paying the bills on maturity. The charge made for accepting takes the form of a commission.

Accepting Houses.—In international trade it often happens that the bank where an importer of goods keeps his account is not of sufficient reputation outside its own country for bills accepted by it to command a good price. He may then arrange for bills to be accepted by some financial house of world wide credit in a foreign centre. The centre chosen will be one where it is convenient to get the bills discounted. London, with its highly developed free discount market has long been pre-eminent in this respect, though since the World War there has been a rapid and important development of facilities in New York. This accepting on behalf of clients in foreign countries is sometimes undertaken by banks (especially those with branches abroad), but also by concerns which specialize in the business. These latter are known as accepting houses.

Merchant Bankers.—Merchant bankers are a special class of bankers, peculiar (at any rate under that name) to London. Their characteristic is that they do not depend mainly on deposits like an ordinary bank, but use their capital and the power of their credit to carry on certain classes of business involving the movement of large sums, and remunerated by commission. The accepting of bills is one of these. Foreign exchange business is another. A third, and one which diverges more markedly from the functions of an ordinary bank, is the issuing of new capital. Issuing houses (as the merchant bankers who undertake this business are called) act as intermediaries between the company promoters or public authorities who seek to raise capital, and the investment market which provides it. They do not necessarily provide any of the capital themselves, nor even act as underwriters. It is their function to provide channels of approach through the market to

the investors, and to find underwriters who will guarantee the subscription of any part of the desired capital which the investors do not in the first instance supply. Every financial centre has financial houses of some kind to do the work which in London falls on the issuing houses. In the United States, they are called investment bankers, in France *banques industrielles*. In many countries the function is combined with ordinary banking. In London itself this practice is growing among the banks. The merchant bankers differ from ordinary bankers in that they are usually private partnerships, not companies or corporations. Exceptions have begun to appear in recent times (e.g., Barings and Lazards are both limited companies). The name merchant banker has a historical significance, in that the firms which bear it were evolved from mercantile concerns. The merchant engaged in international trade was likely frequently to find himself either with liquid funds to spare at any of the centres at which he carried on business, or short of funds and obliged to borrow temporarily. He was compelled to keep in touch with all the facilities for temporary lending and borrowing and for the transfer of funds from place to place. The big merchant was in a position to make a profit by allowing, at a suitable charge, his smaller colleagues to share in these facilities.

Exchange Banks.—Banks with branches in several different countries form a special class. They tend to specialize in foreign exchange and in the bills drawn to finance international trade, and they may be called (as in India) exchange banks, though the name is not in general use. In general an exchange bank has its head office or a branch at some big financial centre (such as London, New York, Paris or Amsterdam), and is constantly buying from its customers at its other branches bills drawn on this centre. These bills it sometimes sells and sometimes holds till maturity. The London discount market buys the greater part of its supply of commercial bills from the exchange banks. The exchange banks also do acceptance business.

Mortgage Banks.—The designation bank is sometimes given to institutions which raise money by the issue of shares or debentures and lend it on mortgage to farmers and others who seek capital to develop land. When such institutions do not receive any money on deposit it is hardly correct to call them banks. They are rather investment companies or finance companies. But as usage allows them to be called banks, they require mention here.

UNITED STATES

The general term "bank" in the United States means an institution chartered by the State or National Government to accept the care of money belonging to individuals, firms and corporations, thereby, among other things, relieving them of the risk of keeping large sums of money in their possession. It is also a grantor of credit, and is the medium through which all general business transactions are ultimately cleared. There are, however, many kinds of banks. There is the bank of deposit, just described, and there are savings banks, trust companies, private banks, banks of discount, acceptance banks, and the Federal Reserve Banks.

Savings Banks.—A savings bank is one in which people deposit in a savings account money which they do not expect to use immediately, and upon which they can receive a higher rate of

interest than is generally allowed by banks of deposit. This higher rate of interest is possible because the account is not a cheque-drawing one as in a bank of deposit, consequently the operations of savings banks are much simpler and the expenses not as high as in banks of deposit. The amount any one person may deposit in a savings bank is usually limited.

Federal Reserve Banks.—There are 12 Federal Reserve Banks in the United States. The depositors of the Federal Reserve Banks are the banks of deposit that are members of the Federal Reserve system. Their deposits represent the reserves required by law for all banks of deposit. Each bank of deposit in the Federal Reserve system is a stockholder in the Federal Reserve Bank, its holdings being in proportion to the capitalization of the banks of deposit. There are no other stockholders in the Federal Reserve Banks. The Federal Reserve Banks, however, are of much greater importance than mere custodians of the reserves for banks of deposit, as they are the principal means of procuring an elastic currency to meet the credit needs of the country. This is accomplished principally by permitting banks of deposit (which are members of the Federal Reserve system) to rediscount certain classes of commercial paper with the Federal Reserve Banks, for which the Federal Reserve Bank pays the bank of deposit in Federal Reserve notes, which currently pass as money. The method of conducting this transaction is for a bank of deposit requiring additional money to take to the Federal Reserve Bank paper (notes) arising out of a business transaction, such paper being subject to certain restrictions making it eligible. The Federal Reserve Bank then gives the bank of deposit Federal Reserve notes equal in amount to the full face value of the paper accepted for discount. The Federal Reserve Bank then pledges 60% of such paper, together with 40% of gold, with the U.S. Government as collateral for the Federal Reserve notes which were given to the bank of deposit in exchange for the paper.

In theory, the Federal Reserve notes issued when the individual's note is discounted or pledged with the Federal Reserve Bank are retired when the individual pays his note at maturity. The individual then gets back his note and the Federal Reserve Bank gets back the Federal Reserve notes issued therefor, which are sent to Washington for redemption and cancellation. Thus everything reverts to the same condition that existed before the individual's note was taken to the Federal Reserve Bank. This produces an elastic currency, making a greater amount of money available when needed, and retiring the money as soon as the need for additional credit has passed. As a practical matter, it is not possible to use the identical Federal Reserve notes to pay off the individual's note at maturity, nor is it practicable always to pay off the notes with the Federal Reserve notes issued through any particular Federal Reserve Bank. Therefore, Federal Reserve notes issued through any Federal Reserve Bank can be used for this purpose, so that the individual is relieved of the task of hunting around to secure any particular Federal Reserve notes, and the burden of sorting out the notes falls on the Federal Reserve Banks. As a matter of practice, the individual merely gives his cheque to the bank of deposit that took his note in the first place, and that bank makes the necessary settlement with the Federal Reserve Bank.

The extent to which these rediscounting transactions can be employed is limited by the supply of gold in the Federal Reserve Bank, for the latter must deposit gold with the U.S. Government to the extent of 40% of the amount of Federal Reserve notes issued. Banks of deposit may also borrow from the Federal Reserve Banks by pledging U.S. Government bonds as collateral.

Banks of Deposit.—Banks of deposit may be generally classified as National banks, State banks and trust companies. The principal difference between National banks and State banks is that the National banks can issue bank-notes, commonly known as money, while a State bank or trust company cannot. Under recent laws, national banks, as a general rule, can perform all the fiduciary acts of a trust company, so that the principal difference between the three classes of banks is in the issuance of bank-notes. But since the establishment of the Federal Reserve system in 1913, the privilege of issuing bank-notes by National banks is exercised only to a very limited degree.

The chief functions of a bank of deposit are in acting as custodian for the money of individuals, firms and companies, making collections for such customers and supplying credit facilities for the transaction of business. In its simplest form, the bank of deposit accepts deposits and moneys subject to cheque and lends out the funds during the period in which the money is not required by depositors. A bank's most common service to its depositors is the collection of cheques, drafts, coupons, etc., which makes necessary a vast machinery for the smooth and speedy handling of these items. The collection of items deposited by customers not only includes cheques and drafts drawn on other banks, in the same city or in other cities, but also the collection of enormous amounts for export of cotton, oil, wheat and other materials to foreign countries, and provides the necessary machinery to enable the farmer and manufacturer to market their products abroad. These latter transactions are usually financed by drafts drawn on foreign banks, which are purchased by banks of deposit, the purchase price being based on rate of exchange, interest rate, time required for collection of drafts, etc. Through the issuance of import letters of credit the banks also facilitate the importation of products required in this country.

Another universal service that a bank of deposit renders is the payment of cheques drawn by its depositors as they spend their money. To render them this service it is necessary for a bank to keep records showing at all times how much balance each depositor has in his account. These operations may appear simple, but they necessitate the employment of officers and clerks and involve various expenses that the bank must earn by loaning out a portion of the deposits in its possession. If a bank allows interest on deposits, such interest also must be earned. A bank affords depositors a cheap and safe way of transacting their financial affairs, and, as compensation for this service, the bank has the use of part of the money while it is on deposit. The bank can use only part of the money because a portion of the deposits must be held under the law as legal reserve, to facilitate payments in the event of heavy, unexpected withdrawals of deposits. The amount of legal reserve varies according to the population of the city or town in which the bank is located.

On the other side of the picture, there is the loaning of funds by the banks, a function necessary to meet the credit needs of business and to supply the banks with revenue to meet expenses, pay taxes and declare dividends to their stockholders. In loaning out its money, a bank must look first to the safety of the loan; whether it will be paid promptly at maturity and whether the collateral, if it is a secured loan, will have a ready market value in case of default of the loan, at maturity; or, if it is an unsecured loan, whether the borrower can pay 100 cents on the dollar in event of forced liquidation. A bank must next consider whether, in view of the maturities of its other loans and the probable withdrawal of deposits at certain seasons of the year, it is justified in lending money for the period desired by the borrower. It must also determine whether, if it advances the full loan desired, it may later be obliged to refuse loans to other depositors who may desire accommodation during the period involved. For a bank must keep in a liquid position and at the same time endeavour to arrange its affairs to take care of all its customers. It will lose business if it attempts to cater to a favoured few.

Other Banks.—Private banks consist of individuals or firms engaged in the banking business. Such banks accept deposits, but cannot avail themselves of the privileges of the Federal Reserve system, and hence usually make their collections through some bank of deposit where they have accounts. Banks of discount confine their activities largely to discounting commercial paper, acceptances and bills of exchange, and are comparatively new institutions in the United States. Acceptance banks primarily accept bills drawn by their customers, which are then usually sold in the open market. For guaranteeing the credit of their customers in this manner, the acceptance bank receives compensation from its customers, which is the principal source of revenue (S. H. P.)

BANK-NOTES. For our present purpose we include in this description all paper substitutes for metallic currency, whether issued by banks, governments or other financial institutions. Metal

and leather have been used as tokens in many parts of the ancient world, but they need not here be considered.

Early bank-notes were simply printed forms in which the amounts were written by hand. They were usually for large amounts (£40 and upwards) and were printed upon water-marked paper; and, although no precautions were taken in the engraving to prevent fraudulent imitation, forgeries were comparatively rare. But, when at the end of the 18th century small notes for £1 and £2 were put in circulation, forgery became rife, as many as 352 persons being convicted of this crime in England in a single year, and a constant trial of skill has since been going on between the makers of bank-notes and the counterfeiters. Engine-turned ornaments and emblematical figures or views introduced in the engraving, in conjunction with special water-marks in the paper, held the forgers somewhat in check until the discovery of photography put into the hands of the counterfeiter a most dangerous weapon, by the aid of which complicated patterns and vignettes could be reproduced. To prevent such reproduction Henry Bradbury, in 1856, introduced anti-photographic bank-note printing, in which the essential portions of the note were printed in one colour and over this another protective colour was placed. A photograph of a note printed in this way presented a confused mingling of the two colours.

The advance of photographic knowledge provided a means of obtaining a photograph of one or both of the colours that were in use in these early notes, and in order to make reproductions still more difficult a third colour was introduced.

Modern currency notes have for their security certain features which experience has found are not easily reproduced. The quality of the paper and its water-marking have long been regarded as providing elements of security of no mean importance, because it is not easy to make paper which has the characteristic rattle of some bank-notes, nor can the water-marking be copied very easily. The water-marking may take two forms. It may be an over-all water-mark, which forms a continuous pattern, and is not registered with the note, or the water-mark may be registered with the printing so that it always forms a characteristic pattern of the note, and this scheme has in many modern notes been elaborated to the extent of producing designs and even borders in several tones, two and three plane water-marks.

When a good portrait water-mark is registered in a conspicuous window in the note, it forms a feature which the eye can pick out immediately, and it requires very considerable skill on the part of the counterfeiter to copy sufficiently well. The effect of water-marking is to give different thicknesses and hence different degrees of translucence to the paper, but with modern papers, especially the so-called mould-made papers, the thinning produced by the water-mark is not sufficient to reduce the strength of the paper unduly.

All three possible methods of printing have been employed for the printing of paper currency: intaglio printing, where the design is recessed into the surface of a plate or cylinder; lithographic printing, where the printing is on a flat surface of lithographic stone or grained metal plate; and letterpress printing, where the design is raised as in ordinary type.

The most widely used method has been plate printing, an intaglio process of printing from steel plates. The engraving in this case is carried out in lines and dots, and since the printing is from the recessed portion of the plate it is possible to transfer to the paper considerable quantities of ink, so that great variation in the strength of the print may be made according to the depth and width of the engraved lines. Thus in a single design rich bold lines fade away to extremely fine and delicate shading. Excellent samples of this are seen in the United States currency. Work of this kind, produced by engraving lines upon metal, is known as black line work, but much use has been made of geometrical patterns with white lines. In this case it is the space between the lines which is printed, and the lines are left clear of ink. Work of this kind is naturally very difficult to imitate by hand engraving, and it is in this that its value chiefly lies.

British Currency Notes.—Another notable example of intaglio printing is the head of H.M. King George V. on the British

£1 treasury notes introduced during the World War, which are produced by rotary photogravure. The printers of this note had to overcome the difficulty of printing by this method on a hard and dry paper, but so well was this done, that the head has retained that characteristic richness which is always associated with the photogravure process. In this case, as in so many other cases of intaglio printing, further printings by other processes have been added in order to render the work difficult to copy by photography.

Letterpress printing has been used considerably for bank-note work, and also for printing stamps. This method has the advantage of being rapid and much cheaper than plate printing, as the work is done on ordinary letterpress printing machines. Such printing is characterized by the lines and dots having sharp edges, but the amount of ink which is transferred to the paper is much less than in plate printing, so that the raised lines and rich effects of the latter method are wanting. The method has, however, several important advantages. In the first place, the printing plates can be duplicated to any desired extent by electrotyping, and provided that these electros are replaced before they are badly worn, great numbers of impressions can be secured which are all exactly alike.

Bank of England Notes.—The notes issued from the Bank of England are printed from such relief or letterpress plates. Here the security lies very largely in the paper with its characteristic rattle and water-marking, but the printing is very carefully and uniformly carried out, so that any attempts at forgery can only be successful when both the paper and the high quality letterpress printing are well imitated. The comparative immunity of these notes from forgery is also partly due to the fact that they are usually examined with some care when they pass from hand to hand. Their average life is quite short, so that old and worn notes are rarely seen, and the return of every note is checked before it is destroyed. This latter precaution is hardly possible with notes having very large circulations, such as the British £1 and 10s notes or the United States or Canadian \$5 and \$1 notes. Letterpress printing has also been largely used for supplementary printings in notes where the main printing may be plate work. Besides intaglio and letterpress printing, lithographic printing has been used for security work in the form of offset printing, where the design is photographed upon the thin zinc plate that replaces the lithographic stone, and the lithographic impression is not made directly from the zinc on to paper, but from zinc on to a rubber blanket, which delivers the ink image to the paper. The advantage of this is that very fine lines can be printed upon paper which is by no means smooth. It has, of course, the further advantage of being much cheaper than plate printing, but the amount of ink carried to the paper is, in most cases, even less than with letterpress printing.

Photography a Danger.—The steady progress which has been made in photography is a constant menace to the security of paper money, and those responsible for the production of notes have so to utilize additional printings as to make photographic copying impossible, or at any rate extremely difficult; this has often determined the choice of the colours blended together on the notes, and many beautiful designs have had to be disfigured by over-printings in order to prevent their easy photographic reproduction. The addition of too many elements of security in one note may, however, defeat its own ends, for there is a danger that notes may become so complicated and the paper so covered with a multiplicity of designs and colours that no one can carry with him a mental picture of the genuine note.

In Great Britain a wise restraint has been shown in avoiding much over-elaboration, and in not covering up the whole of the paper with printing, so that the texture and water-marking retain their value.

Designs which are too simple can be imitated by a skilful engraver; and there have even been cases in which individual notes have been drawn by hand with some little success.

Complete security is perhaps impossible, but a high degree of security may be obtained by careful attention to the following points: (1) identity of appearance of all the notes of an issue; (2) arrangement of colour scheme so that none of the printings

can be secured by photographic copying; (3) use of paper which itself contains elements of security in its quality and water-marking.

(A. J. B.)

In the United States, the treasury department has always relied on finely executed intaglio engraved plated printing and a high-grade distinctive paper having, since 1885, two rows of coloured silk fibre in the body of the paper, from top to bottom of the note. The serial number and seals on the face of the note are of a different colour than the black face printing, and the back of the note is generally an elaborately engraved plate impression.

A study of the existing paper currency of the United States was undertaken by the Bureau of Efficiency in 1925 at the request of the Treasury Department. Estimates placed the life of the most popular note in circulation, the dollar bill, at eight months, while the cause of damage by wear was attributed chiefly to folding. The bureau found that the life of the currency could be lengthened by producing a better paper, permitting the paper to season after each process of manufacture in the Bureau of Engraving and Printing, and by suitably surface treating the bills before they were issued. In 1927 the Treasury Department adopted a paper money of new size and redesigned it in the interest of security, simplification and economy. Printing of the new currency began in 1928 with Treasury notes, the first of which was the dollar bill. The plant has an output of about \$10,000,000 of paper money daily. Accumulation of a three-months' reserve of dollar bills was proposed before issuing, to be followed by the higher denominations of this type and, in turn, by gold and silver certificates and Federal Reserve and national bank notes, the whole to be issued within five years. The new note is $2\frac{1}{8}$ in. by $6\frac{1}{8}$ in., about one-third less than the older in size.

BANK OF ENGLAND. The movement towards the establishment of the Bank of England dated from before the French wars of William III, and sprang from the city merchants' dislike of the London goldsmiths for their rapacity and speculative propensities. Commercial development too had reached the point where the advantages and significance of a sound well-backed paper currency could be appreciated, the more so as the current coin of the realm fell far short of its purported value.

Formation and Early History.—The Bank of England was not the original scheme of William Paterson, its founder. As is usual in English political history, it came into being almost by the back-door, deriving its life from the Tonnage act of 1694, of which the preamble read "An Act for granting to their Majesties several Rates and Duties upon Tunnages of Ships and Vessels, and upon Beer, Ale and other Liquors: for securing certain Recompenses and Advantages, in the said Act mentioned, to Such persons as shall voluntarily advance the Sum of Fifteen hundred thousand Pounds towards carrying on the war against France."

The bank clearly arose from a deal between the Government and its promoters, the former receiving the cash, and the latter the privilege, and political opposition from the Jacobites and goldsmiths ran upon the expected lines. It failed, and the bank came into being. The capital was £1,200,000, the whole of which sum was to be advanced to the Government at a rate of 8% plus £4,000 per annum for expenses, or £100,000 per annum in all. The privileges of a bank were granted for 12 years to the corporation, which was allowed to deal in bills of exchange or bullion, but not in merchandise, and to issue notes up to a volume equal to that of its capital. Its profits were derived from the interest on the Government loan, and from its general banking business.

Its early days were naturally troubled. The national finances and currency were in a sad mess, and its own privileges were repeatedly threatened. Nevertheless, it survived, and provided a safe depository for the citizens' money, and thanks to its power of accumulating funds caused a marked fall in the rate of discount.

The next landmark in the history of the bank is the act of 1700, following the expiry of the bank's charter. This was the fruit of a fresh "deal" with the Government. The Government got its rate of interest reduced from 8 to 6%, a fresh loan of £400,000, and the right to ask the bank to issue exchequer bills for them. In return, the bank got its privileges renewed until 1732, the right to double its capital and so its note issue,

and a monopoly of joint-stock issue banking in England. This last clause was of great importance, as for over a century it forced the banking system of the country into the hands of private individuals of varying substance, knowledge and experience.

Meanwhile, as the bank's own capital was lent to the Government the volume of the Bank of England's note issue depended on the size of the Government debt.

South Sea Bubble.—In 1711, the South Sea Company was founded, and for nine years was conducted upon a more or less sane basis. In 1720, as every history book relates, its directors and the whole financial world went mad. The company offered to take over the national debt at an interest rate of 5%, falling to 4% in seven years' time, and to pay 3½ millions for the privilege. The Bank of England was not to be outdone in this form of lunacy, and bid 5 millions. The South Sea Company promptly raised their bid to 7½ millions. Fortunately for the bank, even their most generous (and insane) offers were rejected. When the crash came, the bank had to meet a run, but just managed to stave off disaster. Later on, the bank played its part in the solution of the numerous financial problems which were the legacy of the crash. It took over fresh obligations, and incidentally increased its capital by £3,400,000 to £8,950,955. As its new stock was issued at 18% premium, the bank was well rewarded for its new responsibilities.

Having been prevented from committing suicide, and subsequently saved from accidental death, the bank's fortunes were now to run on more even lines. In 1722, the Reserve Fund or "Rest" was established. In 1742, when the bank's charter expired, the Government of the day was once more in a state of impecuniosity, and so the renewal was easily effected, the bank's capital being raised to £9,800,000. The early successes of the Young Pretender in 1745 caused another run upon the bank, but largely owing to the loyal support of the city merchants, disaster was avoided. The years 1750–51 were notable for a more humdrum, and far more important event. At that date the national debt was consolidated upon a 3% basis, and at the same time the Bank of England was entrusted with the administration of the national debt. It, therefore, assumed at this time one of the main functions of a modern central bank.

Subsequent history up to 1797 consists of recurrent crises, the renewal of the bank charter in 1764 and again in 1781, and the famous attack on the bank by the Gordon rioters in 1780.

Napoleonic Wars.—In 1797, following the strain of war, and successive internal crises, the bank was forced to suspend cash payments. The next 25 years were some of the most interesting in the history of the bank. For the greater part of this period England was in the throes of the Napoleonic wars, with their drain upon the resources of the country. Heavy borrowings on behalf of the Government were the rule, and the money so raised was devoted not only to war expenditure at home, but also to subsidies to Britain's allies. Trade was crippled by crises at home and by war risks on the high seas, while a large proportion of the Continental markets were closed to Great Britain.

In the light of the greater economic knowledge and the experiences during and after another and greater war, we can understand exactly what happened, why the bank was unable to encash its notes upon demand, why the foreign exchanges moved against the pound, and prices rose at home. The fact that in four years the bank was forced to lend the Government £10,000,000 seems to us perfectly natural, and so does the expansion in its note issue. The Restriction act of 1797, which legalized the bank's suspension of payments, found its counterpart in the currency note issue of 1914, and it is only fair to say that up to a point Pitt realized the dangers of inflation and the need for increased taxation, just as Lloyd George and McKenna did in 1914–15.

Bullion Committee.—In 1810 the famous Bullion Committee was appointed, and the fact that its deliberations were concentrated upon the Bank of England notes, shows the eminence and importance which the bank and its notes had reached during the first century of its life. For all practical purposes the bank's

notes had imperceptibly become the national currency though it took the suspension of their convertibility to bring the fact home. The Bullion Report, for the first time in our history, exposed the dangers of inflation and enunciated the advantages of the gold standard. It attributed the evils of high prices to the excess issue of bank-notes, which in turn was stated to arise from the suspension of cash payments by the bank. It regretted that what had been intended to be a temporary suspension had been prolonged indefinitely, and called for a resumption of cash payments and the restoration of the pound to its former value.

The report aroused a storm of controversy, and was rejected by a House of Commons who felt itself competent to pass a series of resolutions in flat contradiction of economic laws and facts. This led to fresh inflation and its inevitable results. It was only when the war was over, that conditions were ripe for a return to sanity and stability. The first move came from the bank itself, which in 1816 declared itself able to resume partial cash payments. By 1819, official opinion had swung round to the point where it could accept the doctrines of the Bullion Committee, and by 1821 the full gold standard was re-established upon its original basis of 77s. 10½d. per standard ounce of gold.

The next stage in the bank's history runs from 1821 to 1844. It witnessed the spread of industry and the attempts of banking to keep pace, and was punctuated by various crises, such as those of 1825 and 1836-39. The first of these crises was the direct cause of the initial breach in the bank's monopoly. The act of 1826 permitted joint-stock issue banking outside a radius of 65 miles from London, and henceforth the bank's monopoly was doomed. In 1833, another act was passed, making the bank's own notes legal tender, but at the same time legalizing joint-stock deposit banking in London itself. If the former of these acts had sounded the doom of the Bank's monopoly of issue banking, the latter presaged the gradual extinction of the bank-note itself as the main medium of payment. Once cheques replaced notes, the Bank of England was to change over from its rôle of the chief British bank of the 18th and early 19th centuries to that of the central or bankers' bank of to-day.

In 1836-39, the bank itself was involved in difficulty and only escaped having to suspend payment by a timely loan from the Banque de France (*q.v.*). Public opinion was now alarmed at the fact that while the bank's notes were convertible, the bank was not found to maintain any definite backing in gold behind them. Enquiries and discussions took place, culminating in Peel's Bank act of 1844 (*q.v.*).

Peel's Bank Act.—The provisions of this act are dealt with elsewhere, so that it is sufficient to say that the bank's functions of note issue and general banking were separated into water-tight compartments, and that the volume of the fiduciary issue of Bank of England notes was defined rigidly by the act. In case of emergency, the Government could give the bank leave to issue notes beyond this limit, and this was the operation known as "suspending the Bank Act." Otherwise, every additional note issued had to be backed by gold.

The one exception permitted was that if any country bank-note issue lapsed, the Bank of England could raise its fiduciary limit by an amount equal to two-thirds of the lapsed issue.

Nineteenth Century Crises.—Three times in the 19th century was the Bank act to be suspended, in 1847, 1857 and 1866. The first crisis was the aftermath of the outbreak of railway speculation, and also of high grain prices and heavy corn importation. Numerous country bank failures occurred, and in its efforts to lend assistance, the bank put too high a strain upon its own resources. The suspension of the act immediately restored confidence, and on this occasion no notes were actually issued beyond the normal limit.

The 1857 crisis was more widely spread, and arose in fact from over-rapid development in the United States. The crisis spread to England, and caused a heavy and continued demand for funds upon the bank. The act was suspended in the nick of time (or else the bank would have had to close its doors) and this time £908,000 excess notes came into circulation.

The 1866 crisis originally affected general industrial specula-

tion which rapidly attained an unhealthy volume. It was identified with the failure of the famous London finance house of Overend and Gurney, which caused an immediate panic and a run on the bank, who on "Black Friday," May 11, saw its reserve shrink from 5.7 to 3 millions. As before, the suspension of the act relieved the tension. Money remained dear for a long time and further failures occurred, but as in 1847, no additional notes were issued.

The Baring collapse in 1890 caused another severe crisis, but this time the bank managed to keep things in hand, and with the help of loans from the Banque de France, managed to avoid having to ask for a suspension.

The Bankers' Bank.—It was during this generation that the bank finally recognized that it had "suffered a sea-change" and became primarily a "bankers' bank." Not that it did not from its inception accept deposits from other banks and discount bills for the market. The pre-eminence of its note circulation alone would have ensured that it should receive business from every financial institution. In 1844, deposits from London bankers amounted to £963,000, and it is reasonable to suppose that an omnibus item of £5,631,000, termed "other deposits" included a fair proportion of "bank money."

The act of 1844 crystallized the whole position, and 20 years later Bagehot and Goschen interpreted it to the authorities of the bank itself. In brief, the Bank of England holds the gold at the basis of the nation's credit structure, and is responsible for maintaining a proper proportion between gold and the supply of credit. Should the proportion fall too low, it has various time-honoured means of rectifying the situation (*see* BANKING AND CREDIT; MONEY MARKET).

This was the main function of the bank up to 1914. The growth in its business is shown by this composite balance-sheet representing the years 1844 and 1903. To save space, all figures represent millions. Post-war figures are also given in the table, but these will be considered later.

Issue dept.	16-9-1844	29-7-1914	18-2-1920	2-11-1927
Notes issued . . .	28.3	55.1	126.1	169.5
Govt. debt . . .	11.0	11.0	11.0	11.0
Other securities . . .	2.9	7.4	7.4	8.7

Notes† . . .	8.1	25.4	32.5	32.9
Gold and silver coin†9	1.5	.8	1.5

*Represents "liabilities."

†Represents "reserve."

Taking for the moment the first two columns, the note issue has expanded from 28.3 in 1844 to 55.1 millions in 1914. This is due to two causes, these being the lapse of the majority of private note issues and the great increase in the supply of gold. Reserves in the banking department have risen from 9.0 to 26.9 millions and liabilities from 12.2 to 67.1 millions. The "proportion" between the two has fallen from 74% to 40%, and this is largely a measure of the increased confidence placed in the ability of the bank to meet its obligations, and also represents the increased economy effected in the use of gold and the provision of greater credit facilities to the public. It will be seen that loans to the Government have fallen slightly with the result that the whole of these increased facilities have gone through the medium of "other securities" to the money market and so to the public.

The Bank and the War.—The outbreak of the World War caused an immediate run on the bank. In one week, the reserve dropped to 9.9 millions, a four days' Bank Holiday was proclaimed, and the Bank act once more suspended. This time the suspension was virtually made permanent. The Government issued one pound

PLATE

1. Perspective of the new building of the Bank of England, showing the retention of Sir John Soane's blind defensive outer wall, which will remain all around the building, and which will be linked with the structure above it by the new portico over the Threadneedle Street entrance.
2. Plan of the new building; the shaded sections indicating the rooms where, for generations, the directors have held their meetings and which are to be preserved and incorporated in the new bank as a link with the past

and ten shilling currency notes, which had little gold backing and were legal tender for any amount. With these available *ad libitum*, the fact that the bank's own notes were speedily restored to their normal limits was a matter of purely academic importance: for as long as notes are indefinitely available and are made legal tender, it does not matter *who* issues them. In point of fact, until currency notes could be printed and issued, the bank did have to take advantage of the suspension. This only lasted for a few days, has never been generally known, and in any case is of minor importance.

The subsequent history of the bank is wrapped up with the general financial history of the country. War expenditure forced

BANK OF ENGLAND, THE LOTHBURY ANGLE

the Government to borrow heavily, and as the 1920 return shows part of these loans were raised direct from the bank. The money so borrowed quickly found its way into the deposits of the clearing banks at the bank, so Government securities and other or private deposits swelled apace. As a consequence of this, the whole credit structure was inflated, and prices rose and business expanded accordingly.

The other war change of importance was the concentration of the country's stocks of gold in the hands of the bank. This explains the huge increases in the issue department. The increase since 1920 is due to the substitution of bank-notes for gold in the backing to the currency note issue.

The deflation of 1920-22 was an act of the bank in conjunction with and in compliance with the wishes of the Government. The Government repaid its debt, and the items in the banking department were contracted. This caused the whole credit structure to shrink.

The issue of the various war loans and subsequent conversions entailed an enormous increase to the work of the bank. At times, help was obtained from the staffs of other banks, and in general this side of the bank's work has gained enormously in size and importance.

The Gold Standard Restored.—The final development of the bank came with the restoration of a modified gold standard in 1925. Till then, bank and currency notes alike had been nominally convertible, but as the gold so obtained could neither be used commercially, nor exported, convertibility was but an empty name. The act of 1925 made both notes inconvertible. The bank was still bound to buy gold in any quantity and to sell gold

in multiples of 400 ozs., but gold could not be withdrawn in smaller or broken quantities. It was decided that to allow gold to become a medium of circulation was then a luxury Great Britain could not afford.

In the autumn following the return to gold, the bank had to withstand a severe strain. Large transfers of funds from London to New York were effected, and these caused a heavy drain of gold. The bank only maintained itself by raising its rate to 5%, and this relatively high rate remained in force through the whole of 1926. It is at present the practice of the bank to make frequent changes in its rate. An international money market like London is always a sensitive market, and the bank has to adjust its rate to passing influences.

In 1928, the anomalous covering position created by the war was at last ended by the amalgamation of the two note issues under the control of the bank. According to the Act passed in that year, the bank was to have power to issue notes up to a fiduciary limit of £260,000,000, while to give some measure of elasticity to the British currency system the bank might obtain permission from the Treasury to exceed this limit, such leave being granted for six-monthly periods but not for more than two years in all.

Internal Affairs.—The government of the bank is in the hands of a governor, deputy-governor and 24 directors. By custom, none of these are connected with the London clearing banks, but are drawn from the partners and directors in the big London accepting houses and merchant banking firms.

(N. E. C.)

BANK OF ITALY, THE, now a national bank, was opened in San Francisco, California, in 1904, as a State bank with a capital of \$150,000. It owes much to the enterprise of its founder, A. P. Giannini, a produce merchant who was aided by Italian friends. After the earthquake and fire of 1906, this was the first bank in San Francisco to resume active operations; the section which it served was the first to be rebuilt, largely through loans made by this bank. In 1909 State-wide organization began; by 1928 the bank had 290 branch offices in 165 California cities.

In March, 1927, a national bank charter was secured and the name was changed to Bank of Italy National Trust and Savings Association. In 1927 a New York branch, the Bancitaly Corporation, was established, purchasing control of the Bank of America in April, 1928, and consolidating it with the Bowery and East River National Bank under the name of Bank of America National Association. In June, 1928, the Bank of Italy had total resources of \$804,675,000, with 1,350,000 depositors. It had 15,000 shareholders, including its 4,500 employees (with an average holding of 10 shares), no stockholder being allowed to own a controlling interest. In July, 1928, the Bancitaly Corporation had total resources of \$294,000,000. In the same month, the Bank of America had resources of \$406,000,000. (X.)

For the state Bank of Italy see *BANCA D'ITALIA*, p. 19.

BANK-RATE, the rate of discount charged by the central bank for discounting first-class bills of exchange. It expresses the condition of the money-market, and regulates the price of money. Thus a London banker charges interest on overdrafts at "one per cent above bank-rate," so that the raising of the bank-rate makes money dearer to borrow. In brief, a high bank-rate means dear money, a low bank-rate cheap money. Generally, the open-market rate of discount is less than the central bank-rate; nevertheless the bank-rate governs the open-market rate. In relation to the foreign exchanges, the bank-rate affects the gold reserve, a high rate attracting gold by making it more profitable to use in a market where money is dear, and a low rate tending to cause gold exportation from a market where money is cheap. If, therefore, there is an undue efflux of gold from London the Bank Rate is raised to stop the flow (see *MONEY, MONEY MARKET, FOREIGN EXCHANGES and CENTRAL BANKS*).

BANK RETURN. By section VI of the Bank Charter act (q.v.), the Bank of England is required to issue a weekly statement of the liabilities and assets of the two departments into which it is divided. The return for a certain week in 1927 is as follows:—

Bank of England

An account pursuant to the Act 7 & 8 Vict. cap. 32, for the week ending on Wednesday, Nov. 9, 1927.

Issue Department			
Notes issued . . .	£169,913,970	Government debt.	£11,015,100
		Other securities .	8,734,900
		Gold coin and bullion . . .	150,163,970
	£169,913,970		£169,913,970
Banking Department			
Proprietors' capital	£14,553,000	Government securities . .	£41,310,178
Rest	3,186,980	Other securities	54,853,660
*Public deposits	18,412,592	Notes . .	33,985,260
Other deposits	95,467,372	Gold and silver coin . .	1,473,077
Seven day and other bills	2,231		
	£131,622,175		£131,622,175

*(Including Exchequer, Savings Banks, Commissioner of National Debt and Dividend Accounts.)

Since the bank must keep the business of note issues separated from its general banking business, and the amount of uncovered circulation is regulated by law, the stock of gold coin and bullion in the issue department must always be equal to the notes outstanding (less the statutory amount issuable against securities, now £19,750,000), unless the bank holds silver in the issue department, which for many years it has not done. The notes held outside the Bank of England, which constitute the so-called "active circulation," can be found by deducting from the notes outstanding the amount of notes in the banking department.

The "proprietors' capital" is the amount permanently invested by the stockholders. The "rest" corresponds to the amount reserved out of profits and re-invested in the business; unlike the capital item, the rest fluctuates in amount.

The "public deposits" are the amount standing to the credit of the various departments of state. The amount of this item fluctuates from time to time, being greatest at the time when revenue flows in, or when the Government has borrowed in anticipation of dividend payments.

Owing to the fact that the "other deposits" include the accounts of the joint stock and other banks, when tax payments swell the revenues of the Crown other deposits tend to fall. The most important group of accounts under this head are the accounts of the clearing banks, but the item includes *all* accounts but those of the British Government. The other deposits increase when dividends on state loans are paid, or when a slackening of business increases the inflow of cash to the banks, who re-deposit it at the Bank of England, or when the money market borrows from the bank, or when the joint stock banks restrict loans to customers in order to increase their cash balances.

The assets of the bank fall into two main groups; its holdings of various kinds of British Government stocks, including Treasury bills and Ways and Means Advances (overdrafts granted to Government), "Government securities," and its holdings of other negotiable instruments, other than British Government securities, "other securities." The most important single element in the second group is constituted by bills of exchange.

The ability of the bank to repay its deposits on demand is measured by its holding of cash: the "bank reserve" is the sum of the last two items. The reserve increases if cash flows back from circulation, or if new supplies of gold are sold to the bank; it will fall if gold is exported or a demand for notes for internal circulation arises. An inflow of cash will also increase public or other deposits; an outflow will diminish them. The ratio of the return to the sum of the deposits is known as the "proportion" and a fall in the proportion is a signal to the market that the Bank of England is likely to increase the rate at which it is prepared to lend. (See also BANK OF ENGLAND and BANKING AND CREDIT.)

(T. E. G.)

BANKRUPTCY is the status of a debtor who has been declared by judicial process to be unable to pay his debts. Bank-

ruptcy and insolvency, although sometimes used indiscriminately, have in legal usage distinct significations. When a person's financial liabilities are greater than his means of meeting them he is said to be "insolvent." A debtor may be insolvent without becoming bankrupt, but he cannot be a bankrupt without being insolvent; for bankruptcy is a legal declaration of his insolvency and operates as a statutory system for the administration of his property, which is thereby taken out of his personal control.

The primary objects of bankruptcy legislation are to obtain justice while not pressing unduly on debtors, to discriminate between involuntary inability to meet obligations and wilful refusal or neglect, and to secure to creditors as between themselves an equitable share of such of the debtor's assets as may be available for the payment of his liabilities. Another object has marked recent legislation, namely, the fostering of a higher tone of commercial morality and the protection of the trading community at large from the evils arising through the reckless abuse of credit and the unnatural trade competition thereby engendered. Creditors have conflicting interests as between themselves, and are therefore incapable of acting together as a homogeneous body. Hence the necessity for calling in the aid of professional assignees or trustees, solicitors and other agents, who make it their special business to deal with such matters, exercising both administrative and quasi-judicial functions, in return for the remuneration which they receive out of the property for their services.

BANKRUPTCY IN ENGLAND

The earliest English statute on the subject, 34 and 35 Henry VIII. c. 4 (A.D. 1542), was directed against fraudulent debtors, and gave power to the lord chancellor and other high officers to seize their estates and divide them among the creditors, but afforded no relief to the debtor from his liabilities. Subsequent legislation modified this attitude and introduced the principle of granting relief to the bankrupt with or without the consent of the creditors, where he conformed to the provisions of the bankruptcy law.

The courts exercising jurisdiction originally consisted of commissioners appointed by the lord chancellor. But as a result of legislation in 1831 and 1869 the bankruptcy laws are now administered by two judges of the chancery division specially appointed for the purpose by the lord chancellor, with bankruptcy registrars who deal with the ordinary judicial routine of bankruptcy procedure in the London district, while similar duties are performed by the county-court judges throughout the country.

The Act of 1883.—A feature of the Act of 1883 was the separation it effected between the judicial and the administrative functions, which had previously been exercised by the court, and the transfer of the latter to the Board of Trade as a public department of the State directly responsible to parliament. Under the powers conferred by the act a new department was subsequently created under the title of the Bankruptcy Department of the Board of Trade, with an officer at its head called the inspector-general in bankruptcy. This department exercises, under the direction of the Board of Trade, a general supervision over all the administrative work arising under the act. It has extensive powers of control over the appointment of trustees, and conducts an audit of their accounts; and it may, subject to appeal to the court, remove them from office for misconduct, neglect or unfitness. A report upon the proceedings is annually presented to parliament by the Board of Trade, and although the department is practically self-supporting, a nominal vote is each year placed upon the public estimates, thus bringing the administration under direct parliamentary criticism and control. The act also provided for the appointment and removal by the Board of Trade of a body of officers entitled official receivers, with certain prescribed duties having relation both to the conduct of bankrupts and to administration of their estates, including the interim management of the latter until the creditors can be consulted. These officers act in their respective districts under the general authority and directions of the Board of Trade, being also clothed with the status of officers of the courts to which they are attached. The main objects of the measure were to secure—(1) An independent and public investigation of the debtor's conduct; (2) the punishment of commercial misconduct and fraud in the interests of public morality; (3) the summary and inexpen-

sive administration of small estates where the assets do not exceed £300 by the official receiver, unless a majority in number and three-fourths in value of the creditors voting resolve to appoint a trustee; (4) full control in other cases by a majority in value over the appointment of a trustee and a committee of inspection; (5) strict investigation of proofs of debt, with regulations as to proxies and votes of creditors; (6) an independent audit and general supervision of the proceedings and control of the funds in all cases. Besides amending and consolidating previous bankruptcy legislation, the measure also contained special provisions for the administration under bankruptcy law of the estates of persons dying insolvent; and for enabling county courts to make administration orders for payment by instalments in lieu of immediate committal to prison, in the case of small judgment debtors.

An amending act, under the title of the Bankruptcy Act, 1890, was passed in that year, more particularly with regard to the conditions under which a bankrupt should be discharged or schemes of arrangement or composition be approved by the court. These two acts were supplemented by a large body of general rules made by the lord chancellor with the concurrence of the president of the Board of Trade, which may be added to, revoked or altered from time to time by the same authority. These rules are laid before parliament and have the force of law.

Besides these general acts, various measures dealing with special interests connected with bankruptcy procedure have from time to time been passed since 1883, the chief of which are as follows, viz., the Bankruptcy Appeals (County Courts) Act, 1884; the Preferential Payments in Bankruptcy Act, 1888, regulating the priority of the claims of workmen and clerks, etc., for wages and salaries; and the Bankruptcy (Discharge and Closure) Act, 1887, dealing with unclosed bankruptcies under previous acts. In 1906 the Board of Trade appointed a committee to enquire into and report upon the effect of the provisions of the laws in force at the time in relation to bankruptcy, etc.

The Acts of 1913 and 1914.—The recommendations of the committee were embodied in an act of parliament passed in 1913. This measure was repealed and re-enacted in 1914 as part of the Bankruptcy Act, 1914, which consolidates substantially all the previous statutes. Among the changes effected by the Act of 1913 the following are conspicuous. Offences by bankrupts were made punishable summarily, and power was given to official receivers to institute and conduct prosecutions. In many cases of offences by bankrupts it was declared that the onus of proving absence of intent to defraud should lie on the debtor. Failure to keep proper accounts by a person who has previously been made bankrupt was made an offence, provided the unsecured liabilities exceed £100 and the bankrupt is unable to show that in the circumstances in which he traded or carried on business the omission was honest and excusable. The act also rendered criminally liable a bankrupt who, having been engaged in trade or business and having contracted debts therein, has contributed to his insolvency by gambling or rash or hazardous speculation. For a bankrupt to obtain credit in the sum of £10 or upwards without disclosing the fact that he is undischarged was declared criminal (the limit having formerly been £20), while it was also declared criminal for him to trade in any name other than that in which he was made bankrupt without disclosing the fact. This act also amended the law as to married women in relation to bankruptcy, and as to the avoidance of settlements. It also dealt with assignments of book debts, providing that, where a person engaged in any trade or business makes an assignment of his existing or future book debts and is subsequently adjudicated bankrupt, the assignment is void against the trustee as regards any book debts which have not been paid at the commencement of the bankruptcy, unless the assignment has been registered as if it were a bill of sale. This, however, does not affect assignments of book debts due at the date of the assignment from specified debtors, or debts growing due under specified contracts, or debts included in the assignment of a business made *bona fide* for value.

The cost of bankruptcy administration is provided for: (1) by fees charged to bankrupt estates, (2) by interest on balances at the credit of such estates with the bankruptcy estates account, and

(3) by interest on unclaimed funds at the credit of estates under former Bankruptcy Acts. The system is practically self-supporting and involves hardly any charge upon the taxpayers of the country.

Who May Be Made Bankrupt.—Generally speaking any person, being a debtor, may in certain circumstances be made bankrupt in England and Wales. The term "debtor" as used in the Act of 1914 (unless the context otherwise implies) includes any person, whether a British subject or not, who at the time when any act of bankruptcy was done or suffered by him (a) was personally present in England; or (b) ordinarily resided or had a place of residence in England; or (c) was carrying on business in England, personally, or by means of an agent or manager; or (d) was a member of a firm or partnership which carried on business in England. It will be seen from this that a foreigner may in certain circumstances be subject to the English bankruptcy laws. Subject to what will be said presently about married women, every adult may be made bankrupt, whether engaged in trade or not; but an infant cannot usually be made bankrupt although he is engaged in trade and obtains credit in the course of his business. If he can be made bankrupt at all, it can only be in respect of a judgment debt for "necessaries"—a phrase which has a special meaning amongst lawyers. With regard to a married woman, although she could not formerly have been made bankrupt at all, now, if she carries on a trade or business, whether separately from her husband or not, she is subject to the bankruptcy laws as if she was a *feme-sole*. Whether a lunatic can or cannot be made bankrupt has never been decided; but it is plain that he cannot commit an act of bankruptcy (the necessary preliminary to an adjudication) which involves intent. A convicted felon may be made bankrupt. Peers and members of the House of Commons although having "privilege of parliament" may be made bankrupt. Although a corporation or limited company is for some purposes a "person," a receiving order (the order which leads to adjudication) cannot be made against any such body.

Petition and Receiving Order.—Any court exercising bankruptcy jurisdiction in the district in which he resides or carries on business in England or Wales may make a receiving order against a debtor, whether a trader or not, either on his own petition or on that of a creditor or creditors whose claims aggregate not less than £50. In the case of a creditor's petition proof must be given of the debt, and of the commission of an act of bankruptcy within three months preceding the date of the petition. An act of bankruptcy is committed if the debtor fails to satisfy the creditor's claim upon a bankruptcy notice; if he makes an assignment for the benefit of his creditors generally; if he absconds or keeps house; if he gives notice of suspension of payments, if his goods are sold or seized under execution; if he files in court a declaration of inability to pay his debts; if he grants a fraudulent preference or conveyance, or if, upon an application being made to commit him under the Debtors Act, a receiving order is made in lieu of an order to commit. In such a case the judgment debtor is deemed to have committed an act of bankruptcy. These acts are here enumerated in the order in which they most frequently occur in practice, but failure to comply with a bankruptcy notice is by far the most common act of bankruptcy. By a "bankruptcy notice" is meant a notice by a judgment creditor or creditor who has obtained an order for payment by his debtor calling upon his debtor to pay, secure or compound for the debt to the satisfaction of the creditor or the court. Failure to comply with the notice within seven days (if the debtor is in England) constitutes an act of bankruptcy upon which a petition is founded. Bankruptcy notices are constantly used by the judgment creditor as a means of enforcing his judgment, as most debtors, whose credit is at stake, will make every effort to pay rather than face the consequences of a petition in the bankruptcy court.

An assignment for the benefit of creditors generally is a fairly common act of bankruptcy and it is none the less so because it is registered as a deed of arrangement. Such a deed, however, cannot be relied on as an act of bankruptcy by all creditors party or assenting to it, or by any creditor who does not do so within a month after receiving notice of its execution from the trustee.

Bankruptcy proceedings are initiated by a petition, which may

be presented by a creditor or by the debtor himself. Any body or person who can take proceedings to recover a debt at law or in equity may present a bankruptcy petition. A man may take an assignment of a debt for the express purpose of founding a petition upon it. But a creditor may not present a petition unless the debt is a liquidated sum amounting to £50 or more payable immediately or at some future time. The act of bankruptcy on which the petition is founded must have occurred within three months of the date of the petition and the debtor must be domiciled in England or must have ordinarily resided or had a dwelling place or place of business in England; or (except in the case of a person domiciled in Scotland or Ireland, or a firm or partnership having its principal place of business in Scotland or Ireland) he must have carried on business in England by means of an agent or manager, or (except as aforesaid) must have been within the said period a member of a firm or partnership of persons which has carried on business in England by means of a partner or an agent or manager. The petition, if successful, results in a receiving order being made against the debtor, but this is not made until eight days after the service of the petition.

At any time after the presentation of a bankruptcy petition any action, execution or other legal process against the property or person of the debtor may be stayed. The general rule, however, is that proceedings will not be restrained to which the discharge of the debtor from his bankruptcy would be no defence. For example, a claim in tort against a debtor for fraudulent breach of trust would not be restrained, nor a committal order for non-payment of rates.

A "receiving order" does not divest a debtor of his property; it merely protects it. If a receiving order is made on a debtor's own petition, adjudication follows as a matter of course, unless a composition or a scheme of arrangement is accepted by the creditors. As soon as the order is made an official receiver is constituted receiver of the property of the debtor, and thereafter no creditor can pursue any remedy against the debtor save by leave of the court, and then on such terms as the court may impose. And it is obvious that this must be so, otherwise one creditor might secure an advantage over the others. Should it appear that the majority of the creditors are in Scotland or Ireland, and that from the habitation of the property it would be more convenient to administer the bankrupt's property there, a receiving order may be rescinded. It may also be rescinded if the court is satisfied that the debtor has paid all his debts since it was made. Where there is an estate or business to be managed the official receiver may appoint a special manager, who receives such remuneration as the creditors or, failing them, the Board of Trade may determine.

Statement of Affairs.—As a consequence of the receiving order the debtor must make out and submit to the official receiver within a prescribed period a statement of his affairs. The statement must be verified by affidavit, and must show the particulars of the debtor's assets, debts and liabilities, the names, residences and occupations of his creditors, the securities held by them respectively, the dates when the securities were respectively given, and such further or other information as may be prescribed or as the official receiver may require. The official receiver supplies the bankrupt with a form of statement and may employ someone to assist the debtor to prepare it. It must be made out within seven days of the receiving order made on a creditor's petition and within three days of the receiving order made on debtor's petition. Failure to furnish it may involve adjudication; and the omission of material facts may render the bankrupt criminally liable. The statement of affairs is open to the inspection of creditors and may be used against the bankrupt in any proceeding connected with his bankruptcy. The debtor must also in every case submit to a public examination in court, in which the official receiver, the trustee and any creditor who has proved his debt may take part. His evidence may be used against him. He may further be specially examined by the court at any time with reference to his dealings or property, and creditors may attend and take part in the examination. He must attend the first meeting of creditors, wait upon the official receiver, trustee, and special man-

ager, and give all necessary information and generally do all acts which may reasonably be required of him with the view of securing a full investigation of his affairs. He may be arrested if there is reasonable ground for believing that he is about to abscond, destroy papers or remove goods, or if he fails without good cause to attend any examination ordered by the courts. The court may also for a period of three months order his letters to be re-addressed by the postoffice to the official receiver or trustee.

First Meeting of Creditors.—This meeting is summoned by the official receiver, notice being given in the *London Gazette* and in a local paper and sent by post to each creditor. A summary of the statement of affairs should accompany the notice, with any observations by the official receiver which he may think fit to make. The object of the meeting is to decide whether any proposal for payment of a composition or for a scheme of arrangement submitted by the debtor is to be entertained, or whether an application should be made to the court to adjudicate the debtor bankrupt. In the latter case the meeting may by an ordinary resolution appoint a trustee with or without a committee of inspection. It may also give any directions as to the administration of the estate. The meeting should be held at the place most convenient for the majority of the creditors. It is presided over by the official receiver or his deputy, who, subject to appeal to the court, admits or rejects proofs for the purpose of voting. For the transaction of business three creditors qualified to vote, or all the creditors if fewer than three, must be present or represented. Only persons who have proved their debts are entitled to vote, and detailed regulations respecting proofs and the valuation of securities are laid down in the Act of 1914. One of the chief alterations in the law on this point is the condition imposed on creditors on bills of exchange to deduct from their claims the value of the liability of prior obligants before voting, thus cancelling the power of controlling the proceedings previously possessed by persons who had no real interest in the estate. Votes may be given in person or by proxy, and stringent regulations are laid down with the view of preventing the abuse of proxies. General proxies entitling the holder to exercise all the powers which the creditor could exercise if present may be given to the official receiver or to any person in the regular employment of the creditor. Special proxies may be given to any person to vote for specified resolutions, or for the appointment of specified persons as trustee and committee. Only official forms can be used, and the blanks must be filled up in the handwriting of the creditor or some person in his regular employment, including the authorized agent of a creditor resident abroad. A proxy must be lodged with the official receiver not later than four o'clock on the day before the meeting or adjourned meeting at which it is to be used. If solicitation has been used by or on behalf of the trustee in obtaining proxies, or in procuring the trusteeship, the trustee may be deprived of his remuneration. Resolutions are ordinary, special or extraordinary. An ordinary resolution is carried by a majority in value of the creditors voting; a special resolution by a majority in number and three-fourths in value of such creditors. The only instance of a resolution other than these is that required for the approval of a composition or scheme, which requires a majority in number and three-fourths in value of all the creditors who have proved. The majority of questions arising at a meeting are decided by an ordinary resolution.

The creditors entitled to vote may, at their first or any subsequent meeting, appoint from among the creditors generally, or the holders of general proxies, or general powers of attorney from such creditors, a committee of inspection to superintend the trustee in his administration of the bankrupt's property. A person may also be appointed subject to his subsequently becoming the holder of a general proxy or general power of attorney, but he must not act until he has obtained this power. The committee must not consist of more than five or less than three persons. It generally includes the more important creditors. A creditor who is appointed a member may not act until he has proved his debt and his proof has been admitted, and he must not, except by leave of the court, become a purchaser of any part of the estate, nor may he, except with the like permission, receive any payment out of the estate

for services rendered by him in connection with the administration of the estate. One of the functions of the committee is to audit the trustee's accounts, and certain functions of the trustee can only be exercised by him with the sanction of the committee.

If the creditors so resolve, or if a composition or scheme of arrangement is not proposed by the debtor or entertained by the creditors, or if entertained is not approved by the court, or if without reasonable excuse the debtor fails to furnish a proper statement of his affairs, or if his public examination is adjourned *sine die*, the court adjudicates the debtor bankrupt and thereupon his property vests in a trustee, and, subject to the payment of the costs and fees of administration, is divisible among his creditors until all his debts are paid in full with interest at the rate of 4% per annum. An order may also be made on the application of the official receiver where the debtor has absconded, or where the court is satisfied that the debtor does not propose a composition or scheme. Notice of every order of adjudication stating the name, etc., of the bankrupt is published in the *London Gazette* and advertised in a local paper.

Duty of a Bankrupt.—A debtor adjudged bankrupt must aid in the realization of his property to the utmost of his power, and in the distribution of the proceeds among his creditors. He must also, at the request of the official receiver, furnish trading and profit and loss accounts and a cash and goods account for a period not exceeding two years before the date of the receiving order. He must also, if required, attend and be cross-examined as to the whereabouts of his property, and may be arrested on a warrant if he refuses to attend.

The Bankruptcy Act of 1914 altered the law as to offences by debtors, making it rather more stringent than it was before. Thus the onus of proving that he is not guilty of any intent to defraud is now, generally speaking, placed upon him. If he fails to make full discovery of or to deliver up his property or books; if he conceals his property or debts; prevents production of books, etc.; or conceals, mutilates or falsifies his books, he may be guilty of a misdemeanour unless he proves that he had no intent to defraud. He is also liable to be found guilty of an offence if he removes property worth more than £10 after or within six months before the date of the petition; or if he fails to disclose the fact that a false debt has been proved by anyone in the bankruptcy. Other offences are the fraudulent parting with or alteration of books; declaration of fictitious losses; obtaining credit by false representations within six months before or after the date of a petition. Again, a bankrupt is guilty of an offence if, having been engaged in any trade or business and having outstanding at the date of the receiving order any debts contracted in the course and for the purpose of such trade or business, he has within two years before the date of the petition materially contributed to or increased the extent of his insolvency by gambling or speculation. A prosecution for this offence, however, cannot be set on foot save by order of the court. Failure by a man who has once been bankrupt or who has compounded with his creditors to keep books of account within two years before a second bankruptcy may also be an offence. With regard to obtaining credit, it is obvious that the public must be protected against the undischarged bankrupt. Accordingly, it is provided that where an undischarged bankrupt (a) either alone or jointly with any other person obtains credit to the extent of £10 or upwards from any person without informing such person that he is an undischarged bankrupt, or (b) engages in any trade or business under a name other than that under which he was adjudicated bankrupt without disclosing to all persons with whom he enters into any business transaction the name under which he was adjudicated bankrupt, he shall be guilty of a misdemeanour.

An undischarged bankrupt cannot sit or vote in the House of Lords. He cannot be elected to sit in or vote in the House of Commons, or be elected or act as a justice of the peace, or mayor, alderman or councillor. Nor can he be a guardian or an overseer of the poor or member of a county council. He cannot be a member or chairman of a parish council, rural district council, or board of guardians if he has within five years before his election or since his election been adjudged bankrupt or compounded with

his creditors. These disqualifications disappear on the annulment of the bankruptcy, or if the court grant a certificate to the effect that the bankruptcy was caused by misfortune without any misconduct on the part of the debtor.

Discharge.—The court may at any time after the conclusion of the bankrupt's public examination, and after hearing the official receiver, the trustee and any creditor, to all of whom previous notice of the application must be given, grant the bankrupt a discharge either absolutely or under conditions, but subject to the following qualifications, viz.:—(1) If the bankrupt has committed (i.e., has been tried and convicted of) a criminal offence connected with the bankruptcy, the application must be refused unless for special reasons the court determines otherwise. (2) If the assets are not equal in value to ten shillings in the pound of the unsecured liabilities (unless the bankrupt can show that he is not responsible); or if proper books have not been kept; or if the bankrupt has traded after knowledge of insolvency; or has contracted debts without reasonable probability of payment; or failed to account for his deficiency; or contributed to the bankruptcy by rash speculation, gambling, culpable neglect, or by unjustifiable expenses; or has taken or defended legal proceedings on frivolous grounds; or has within three months preceding the receiving order given an undue preference; or has increased his liabilities with the view of making his assets equal to ten shillings in the pound; or has previously been bankrupt or made an arrangement with creditors; or has been guilty of any fraud or fraudulent breach of trust; then the court shall, on proof of any of these facts, either (a) refuse the discharge or (b) suspend it for a period of not less than two years, or until a dividend of not less than ten shillings in the pound has been paid; or (c) qualify the order by the condition that judgment is entered up against the bankrupt for payment of any unpaid balance of his debts, or of part of such balance out of his future earnings or property. Assets are deemed to be equal to ten shillings in the pound when the court is satisfied that the property of the bankrupt has realized, or is likely to realize, or with due care in realization might have realized an amount of ten shillings in the pound on his unsecured liabilities. If of the facts referred to the only fact proved is that the assets are not of a value equal to ten shillings in the pound the discharge may be suspended for a period of less than two years. The bankrupt may, however, after two years apply to the court to modify the conditions if he is unable to comply with them. An order of discharge releases the debtor from all his obligations except debts due to the Crown and other obligations of a public character which can only be discharged with the consent of the Treasury, debts incurred by fraud and judgment debts in an action for seduction or as a co-respondent in a matrimonial suit or under an affiliation order, which are only released to such extent and subject to such conditions as the court may expressly order. Debts incurred by fraud in so far as they are the subject of actions of tort are not provable and are not therefore affected by an order of discharge. The release of the bankrupt does not operate as a release of any partner or co-obligant with him. Neither does it release the bankrupt from liability to criminal prosecution. Notwithstanding his discharge a debtor is still bound to help the trustee to distribute the assets.

Composition or Scheme of Arrangement.—After a receiving order has been made the debtor may submit a proposal for the payment of a composition or for the liquidation of his affairs, by a trustee or otherwise, without adjudication. The proposal must be lodged with the official receiver in sufficient time to allow notice, together with a report by that officer, to be sent to the creditors before the meeting is held at which it is to be considered. If the proposal is entertained at the meeting by a majority in number and three-fourths in value of all the creditors who have proved their debts, and if it is thereafter approved by the court, it becomes binding upon all creditors who would be bound by an order of discharge had the debtor been adjudicated bankrupt. A similar proposal may be made after adjudication, and if entertained by the creditors and approved by the court the adjudication may be annulled. The debtor's release will be subject to the terms of the scheme, but his future acquired property will not

pass to the creditors unless there is an express stipulation to that effect. If default is made in carrying out the scheme, or if it is found that it cannot proceed without injustice or undue delay, the court may at any time adjudicate the debtor bankrupt, in which case the scheme will fall to the ground, except in respect of past transactions under it. The approval of a composition or scheme does not release the debtor from his liabilities under the criminal law, nor from the necessity of undergoing a public examination which must, in fact, be held and concluded before the approval of the court is applied for. Also before such approval is given a report must be filed by the official receiver upon its terms and on the conduct of the debtor, and the court must be satisfied, after hearing that officer and any creditor, that the proposal is reasonable and calculated to benefit the creditors and that no criminal offences connected with the bankruptcy have been committed by the debtor. Further, if any fact is proved which would have prevented the debtor obtaining an absolute or unconditional order of discharge had he been adjudged bankrupt, the composition or scheme cannot be approved unless it provides reasonable security for the payment of not less than five shillings in the pound on all the unsecured debts. Where a trustee is appointed to carry out the composition or scheme, all the provisions of the act with reference to the remuneration of the trustee, the custody of funds, the audit of his accounts, and the control exercised by the Board of Trade apply in the same manner as they would under an adjudication. Further, the provisions relating to the administration of property, proof of debts, dividends, etc., will also apply, so far as the nature of the case and the terms of the arrangement admit.

Property Divisible Among the Creditors.—No part of the law of bankruptcy is more intricate or has been the subject of more litigation than this, and any detailed view of the effect of legal decisions can only be gathered by a perusal of the cases; but the following general principles may be stated:—The term "property" includes not only property of which the bankrupt is the true owner, but property in his possession, order or disposition in his trade or business with the consent of the true owner, in such circumstances that he is the reputed owner thereof. The application of the doctrine of reputed ownership has been considerably restricted in recent years by the growth of alleged trade customs, in accordance with which property is frequently lent under a contract of "hire and purchase" or otherwise; and by the decisions of the courts that where such custom is sufficiently proved the doctrine does not apply. Further, the trustee's title not only includes property in the actual possession of the bankrupt, but relates back to the date of the first act of bankruptcy committed by him within the three months preceding the presentation of the bankruptcy petition, and thus invalidates all payments and assignments to creditors made during that period with knowledge on the part of the creditor or assignee of the commission of the act of bankruptcy. In such cases the trustee may, therefore, require the money or property to be restored to the estate. And even where no prior act of bankruptcy is proved any payment made to a creditor with the view of giving such creditor a preference over the other creditors, within the three months preceding the presentation of the petition on which the payer is made bankrupt, is rendered void as against his trustee. Settlements of property within the two years preceding the bankruptcy, unless made before and in consideration of marriage, or made in good faith for valuable consideration, are also void, as are similar settlements within ten years, unless it is proved that the settlor was (independently of the settled property) solvent at the date of the settlement and that the interest in the property passed to the trustees on the execution of the deed.

Certain settlements made in consideration of marriage are also made void or voidable against a trustee in bankruptcy. Thus any covenant or contract by a settlor in consideration of marriage for the future payment of money for the benefit of wife or child, or for future settlement on wife or children of property in which the settlor had no interest at the date of the settlement is void against his trustee in bankruptcy, if it has not been executed at the date of the bankruptcy. This is subject to the exception that

beneficiaries may claim dividends in the bankruptcy, such claims, however, being postponed until the claims of the settlor's other creditors have been satisfied. Not only is such a settlement void, but any payment made thereunder is void against the trustee unless the payee can prove either that the payment was made more than two years before the bankruptcy or that at the date of the payment the settlor could pay all his debts without the aid of the money so paid; or that the payment was made pursuant to a covenant or contract to pay money expected to come to the settlor on the death of a particular person named in the covenant and was made within three months after the money came into the possession of the settlor. If any such payment is declared void, the payee can nevertheless rank as a creditor for dividend in respect of it.

Executions by a creditor not completed at the date of the receiving order are also void, and the proceeds of an execution in the hands of the sheriff must, with certain exceptions and subject to deduction of costs, be handed over to the trustee. But all property held by the bankrupt on trust, and tools of trade, wearing apparel and bedding to a total value not exceeding £20 are excluded from the property divisible among the creditors. With respect to property acquired by the bankrupt, whether by gift or legacy, or consisting of accumulations of business or other profits after the commencement of the bankruptcy and before he obtains his discharge, the trustee's title also prevails; but *bona fide* transactions by the debtor for value, other than transactions relating to freehold property, appear to be valid. Where the bankrupt is a beneficed clergyman the trustee may, subject to certain provisions for the due discharge of the duties of the office, apply for the sequestration of the profits of the benefice, and where he is in receipt of a salary, income or pension, etc., the court may order any part thereof to be paid to the trustee; but where he is an officer of the army, navy or civil service such order is only to be made with the consent of the chief of the department concerned. When a banker has ascertained that a person having an account with him is an undischarged bankrupt it is his duty to inform the trustee or the Board of Trade of the existence of the account, and thereafter the account cannot be operated on except under the order of the court.

When a bankrupt who owns the copyright of a work is liable to pay royalties or a share of profits therein to the author, the trustee may not sell copies of or perform the work, except upon terms of paying the royalties due to the author. Nor can he assign or licence the copyright without the consent of the author or the court except upon terms which will secure to the author payments not less than those which the bankrupt was liable to pay.

Claims of Creditors.—In the distribution of the debtor's property certain claims are entitled to priority over others. Thus the landlord, although not entitled to a preference out of the funds in the hands of the trustee, can distrain for unpaid rent on the goods and effects of the debtor remaining on the landlord's premises; but where the distraint is levied after the commencement of the bankruptcy this right is limited by the Act of 1890 to six months' rent due before adjudication, the remainder of his claim ranking for dividend with the claims of other creditors. Various gas and water companies have also statutory powers of distraint under special acts, but the policy of recent legislation has been to discourage any extension of such privileges. Where the bankrupt holds an office of trust in any savings bank or friendly society, any balance in his hands due to such bank or society has been held under the acts relating to these bodies to be payable in preference to any other claim against the estate. Workmen's compensation, too, up to £100 in each case, is entitled to priority; but where an employer who is injured becomes bankrupt, his rights against the insurance company pass to his workmen. Contributions payable by a bankrupt under the National Insurance Act 1911 are also entitled to preference. Other preferential claims are regulated by the Bankruptcy Acts and include taxes, parochial and other local rates for not more than one year, wages and salaries for four months, but not exceeding £50 (limited in the case of ordinary labourers and workmen to two months' wages not exceeding £25), and agricultural labourers' claims not

exceeding one year's wages, if hired by special contract for payment of a lump sum at the end of a year. These claims are entitled to preference not only over funds in the hands of the trustee, but also over the proceeds of any distraint levied by the landlord within the three months prior to the receiving order, the latter in that case becoming a preferred creditor for the amount so paid. Articled clerks and apprentices may also be allowed repayment of a proportion of the premium on their unexpired agreements. On the other hand, usual trade discounts (exceeding 5%) must be deducted from traders' proofs, and the following claims are postponed until the general creditors are paid in full, viz., claims by a married woman for loans to the husband for the purposes of his business, claims for loans advanced to any person in business at a rate of interest varying with the profits, and claims for interest in excess of 5% per annum. Where a married woman has been adjudged bankrupt her husband cannot claim any dividend in respect of money lent to her for her trade or business until all claims of her other creditors have been satisfied. Subject to these exceptions all debts proved in the bankruptcy must be paid *pari passu*. Any surplus after payment of 20s. in the pound and interest at the rate of 4% per annum, from the date of the receiving order, is payable to the bankrupt.

All claims and liabilities present or future, certain or contingent, arising out of obligations incurred before the date of the receiving order are provable in the bankruptcy, an estimate of the liability in the case of contingent debts being made by the trustee subject to appeal to the court. But demands in the nature of unliquidated damages arising otherwise than by reason of a contract, promise, or breach of trust are not provable, nor are gaming debts or debts barred by the statutes of limitation. A secured creditor if he proves must either surrender his security or value the security and prove for the balance, and the trustee can thereupon, subject to the creditor's power in certain circumstances to amend the valuation, take over the security by paying the amount of the valuation or may require it to be realized. He may be required by the creditor to elect which of these courses he will adopt, failing which the equity of redemption will vest in the creditor.

After payment of costs of administration and preferential debts it is the duty of the trustee to distribute the estate with all convenient speed—the first dividend within four months after the first meeting of creditors and subsequent dividends at intervals of not more than six months; but the declaration may be postponed for sufficient reason by the committee of inspection.

Trustee's Administration.—While the interim preservation and management of the estate is conducted by or under the direct supervision of officers appointed by and responsible to the Board of Trade, the ultimate realization and distribution of the assets devolve upon the trustee appointed by the creditors. But besides acting as receiver prior to the first meeting of creditors, the official receiver also becomes trustee by operation of law on the making of an order of adjudication. He vacates the office when a trustee is appointed by the creditors, and certified by the Board of Trade, but again becomes trustee on the creditors' trustee being released, dying, resigning or being removed from office. As the bankrupt's property vests in the trustee for the time being, and passes from trustee to trustee by operation of law, and without any formal act of conveyance, the continuity of the office is thus secured.

A trustee may be appointed by a majority in value of the creditors voting at the first or any subsequent meeting, or the appointment may be left to the committee of inspection. In either case the appointment is subject to confirmation by the Board of Trade. Before such an appointment may be confirmed, the trustee-elect must also furnish security to the satisfaction of the Board of Trade, and such security must be kept up to the amount originally fixed, or to such lesser amount as that department may require throughout the tenure of the trusteeship, failing which the trustee is liable to be removed from office. Where the creditors fail to appoint a trustee the Board of Trade may do so, but such appointment may at any time be superseded by the creditors.

The trustee is required to take immediate possession of the bankrupt's property, including deeds, books and accounts, and has the powers of a receiver in the high court for the purpose

of enforcing delivery. After payment of the costs of administration it is his duty to distribute the estate in dividends as speedily as possible.

Where any part of the property is held subject to onerous obligations, such as the payment of rent, etc., the trustee may disclaim the same, subject in certain cases to the leave of the court, and the disclaimer operates to determine all interest in or liability in respect of the property on the part of the estate. The trustee is required to keep a record book (which is commenced by the official receiver), containing minutes of the proceedings in the bankruptcy, and a cash book in the prescribed form, in which all receipts and payments by him must be entered. All monies received must forthwith be paid into an account at the Bank of England, entitled the "Bankruptcy Estates Account," which is under the control of the Board of Trade, unless where in special circumstances the sanction of that department is obtained to the opening of a local banking account, but in no circumstances must estate monies be paid to the trustee's private account. When monies are required for the purpose of the estate, special cheques or money orders are issued by the Board of Trade on the application of the trustee.

In his administration of the estate the trustee is subject to control by the committee of inspection, the creditors, the court, and the Board of Trade. The committee is appointed by the creditors and must consist of not more than five or less than three creditors. The Board of Trade is required to take general cognizance of the conduct of trustees, to enquire into any complaints by creditors, and, in the event of any trustee not faithfully performing his duties, to take such action, including the power of removal, as may be expedient.

The trustee's accounts must be audited by the committee of inspection not less than once in every three months; and once in every six months, as well as at the close of the administration, the record and cash books must also be submitted, with the vouchers and the committee's certificate of audit, to the Board of Trade for final audit. If it appears that the trustee has retained more than £50 in hand for more than ten days without a satisfactory explanation he may be removed from office, surcharged with interest at the rate of 20% per annum, and lose all claim to remuneration.

The trustee's remuneration is fixed by the creditors or by the committee, if so authorized by them. It must be in the nature of a percentage on the amount of the realization and on the dividends. If one-fourth of the creditors in number or value dissent from the resolution, or if the bankrupt satisfies the Board of Trade that the remuneration is excessive, the Board may review the same and fix the remuneration. A trustee may not receive any remuneration for services rendered in any other capacity, e.g., as solicitor, auctioneer, etc., beyond that voted to him as trustee; nor may he share his remuneration with the bankrupt, the solicitor, or other person employed about the bankruptcy, or receive from any person any gift or other pecuniary or personal benefit in connection therewith.

A trustee receiving remuneration is not allowed the costs of any other person in respect of duties which ought to be performed by himself. All bills of solicitors and other agents employed must be taxed before payment, as being in accordance with the prescribed scales of costs; and the taxing master must satisfy himself that the employment has been properly authorized before the work was done. All bills of costs must be delivered to the trustee within seven days of the request for the same, otherwise the estate may be distributed without regard to such costs.

When the property, so far as it is capable of realization, has been realized and distributed, the trustee must apply to the Board of Trade for his release, forwarding to each creditor a notice of his having done so, together with a copy of his final accounts.

Small Bankruptcies.—When the official receiver reports or the court is otherwise satisfied that the debtor's property is not likely to realize more than £300 the court may make an order for the summary administration of the estate; in which case, if the debtor is adjudged bankrupt, the official receiver in the ordinary course becomes and remains trustee and certain other modifications are effected with the view of simplifying and accelerating the

procedure. The chief of these modifications are as follows, viz., the Board of Trade acts as committee of inspection; there is no advertisement of the proceedings in a local paper; in legal proceedings all questions of law and fact are determined by the court without a jury; adjudication may be made on a report by the official receiver before the first meeting of creditors where no composition or scheme is proposed; meetings of creditors may be held in the town where the court sits or the official receiver's office is situated; notice to creditors of meetings other than the first meeting and application by a debtor for his discharge are dispensed with in the case of creditors for amounts not exceeding £2. Costs, other than a solicitor's charges, may be paid without taxation, and the time for declaring the first dividend is extended to six months; but the whole estate must be realized and distributed within this period if practicable. No modification, however, is permitted in the procedure relating to the public examination and discharge of the bankrupt. Notwithstanding that an order has been made for summary administration, the creditors may at any time, by a resolution passed by a majority in number and three-fourths in value of those voting at the meeting, appoint a trustee in place of the official receiver, in which case the summary order ceases to be operative.

BANKRUPTCY IN SCOTS LAW

In Scots law the term "bankruptcy" is not capable of any exact definition. Indeed, it has no technical legal meaning and may refer to any one of the three stages in the process of divesting a debtor of his property for the benefit of his creditors—insolvency, notour bankruptcy or sequestration.

Insolvency may be either "absolute" or "practical." Absolute insolvency arises when at a particular time a debtor's liabilities exceed his total assets; practical insolvency when a debtor cannot pay his debts as they fall due although he may not be insolvent in the absolute sense, for his assets when realized may exceed his liabilities. Absolute insolvency is considered in questions relating to the validity of dispositions made by the debtor; practical insolvency in questions between the debtor and his creditors.

Unlike the bankrupt in English law, a notour bankrupt is not deprived of his property but is only restricted as to his capacity to deal with it. The object is to prevent him from disposing of his assets to favoured creditors and to preserve his property for the whole body of his creditors.

Sequestration is the process corresponding to an adjudication in English law whereby a debtor is divested of his property for the benefit of his creditors.

In Scotland, as in England, the law of bankruptcy arose as a remedy against the frauds of debtors. By an Act of the Scottish parliament (1621) all gratuitous alienations made by a debtor at a time when he was "absolutely insolvent" to "conjunct and confidential persons" (*i.e.*, near relations or confidential friends and servants) are annulled in the interests of prior creditors. The onus of showing that value has been given or that the debtor was in fact solvent at the time of the alienation lies upon the person who received the property.

The Act of 1696, c. 5, defined a "notour bankrupt" and struck at preferences to creditors. Under it all voluntary dispositions made at or after notour bankruptcy or within 60 days before to any creditor by way of security for prior debts may be set aside at the instance of prior creditors. No proof of fraud or collusion is necessary and it is immaterial whether the debtor was or was not insolvent at the time of the disposition. This act does not affect any payment to a creditor made in the ordinary way of business.

Notour Bankruptcy.—In 1913 the Bankruptcy (Scotland) Act was passed, which consolidated the law of bankruptcy but left in force the acts of 1621 and 1696. By this act "Notour bankruptcy shall be constituted by the following circumstances:—(1) By sequestration or the issuing of an adjudication of bankruptcy or the granting of a receiving order in England or Ireland; or (2) By insolvency (*i.e.*, practical insolvency) concurring (a)—(1) with a duly executed charge for payment when a charge is necessary, followed by the expiry of the days of charge without payment; (2) where a charge is not necessary, with the lapse without

payment of the days which must elapse before poinding or imprisonment can follow on a decree or warrant for payment of a sum of money; (3) with a poinding or seizure of any of the debtor's movables for non-payment of rates or taxes; (4) with a decree of adjudication of any part of his heritable estate for payment or in security; or (b) with sale of any effects belonging to the debtor under a sequestration for rent" (s. 5).

Notour bankruptcy continues in case of a sequestration till the debtor obtains his discharge and in other cases until insolvency (*i.e.*, practical insolvency) ceases (s. 7). The notour bankrupt is not divested of his property, for, as has been stated above, the object of notour bankruptcy is not to transfer the debtor's property to his creditors but to preserve it in his hands for their benefit. The effects of notour bankruptcy on preferences to creditors under the Act of 1696 have already been noted and in addition notour bankruptcy has the effect of equalizing diligences (*i.e.*, executions of all kinds). Arrestments and poindings used within 60 days prior to the constitution of notour bankruptcy or within four months thereafter are ranked *pari passu* as if they had all been used of the same date (s. 10).

Sequestration.—Sequestration of the estate of any person may be awarded in the following cases:—(1) in the case of a living debtor subject to the jurisdiction of the supreme courts of Scotland: (a) on his own petition with concurrence of creditors for not less than £50; (b) on the petition of a creditor or creditors for not less than £50, provided the debtor be notour bankrupt and has within a year before the date of the presentation of the petition resided or had a dwelling-house or place of business in Scotland. (2) In the case of a deceased debtor who at the date of his death was subject to the jurisdiction of the supreme courts of Scotland: (a) on the petition of a mandatory; (b) on the petition of a creditor or creditors for not less than £50 (s. 11).

A petition for sequestration may be made either in the court of session or in the sheriff court (s. 16), and a petitioning or concurring creditor must lodge with the petition an oath as to the verity of his debt (ss. 20 and 21). When the debtor presents or concurs in the petition sequestration must be awarded forthwith, the court having no discretion in the matter (s. 28). The interlocutor (*i.e.*, order of the court) awarding sequestration declares that the debtor's estate belongs to his creditors for the purposes of the act.

A meeting of creditors is next held to elect a trustee and the election is made by a majority in value of the creditors present. Each creditor must take an oath as to the verity of his debt, produce vouchers for it, and value and deduct any securities he holds. He is then entitled to vote on the balance (ss. 64 and 96). At the same meeting three commissioners are elected from the creditors or their mandatories (s. 72), and it is their duty to advise the trustee, audit his accounts, and declare the amount of dividends (s. 81).

The election of a trustee must be confirmed by an interlocutor of the sheriff and this interlocutor—called the "act and warrant"—vests the property of the debtor in the trustee for the benefit of the creditors (s. 70). Instead of electing a trustee the creditors may decide to have the estate wound up by a deed of arrangement. This requires the support of a majority in number and three-fourths in value of the creditors present and must be approved by the lord ordinary or the sheriff (s. 34).

Sequestration is declared by s. 104 of the act to be equivalent to an arrestment in execution and decree of forthcoming and to an executed and completed poinding. No arrestment or poinding—*i.e.*, no process of execution—executed of the funds or effects of the bankrupt on or after the 60th day prior to the sequestration is effectual, and any funds or effects attached must be given up to the trustee.

After the trustee's appointment has been confirmed the sheriff names a day for the public examination of the bankrupt (s. 83) and may order that the bankrupt's family and confidential servants be examined also (s. 86). Creditors lodge claims for ranking and must value and deduct their securities (s. 61). The trustee may require the creditor to hand over the security at the valuation he (the creditor) has placed on it. S. 118 contains a list of debts

which are entitled to preference. The first dividend is paid at the end of six months from the date of the sequestration (s. 126), the second ten months from the sequestration (s. 128), and subsequent dividends, if any, at three-monthly intervals (s. 129).

Discharge.—The bankrupt may be discharged either on composition or without composition with his creditors. An offer of composition may be made at the "meeting for election of trustee" or at any subsequent meeting, and if it is to be accepted it must be approved by a majority in number and three-fourths in value of the creditors present and finally by the lord ordinary or sheriff (ss. 134 to 142).

If no composition is made, the bankrupt may petition for his discharge (1) at any time with the concurrence of all creditors, (2) after six months with the concurrence of a majority in number and four-fifths in value of the creditors, (3) after 18 months with the concurrence of a majority in value and number, and (4) after two years without any such consents (ss. 143 to 149). The petition for discharge cannot be presented until the trustee has prepared a report of the bankrupt's conduct.

No discharge can be given whether with or without composition unless it is proved to the lord ordinary or the sheriff that a dividend of five shillings in the pound has been paid or that the failure to pay such a dividend is due to circumstances for which the bankrupt is not responsible (s. 146). The debtor by the discharge is free from all debts except debts due to the Crown and certain other obligations. After a final division of the funds the trustee is entitled to his discharge whether the bankrupt has been discharged or not (s. 152).

Summary Sequestration.—The Bankruptcy (Scotland) Act 1913 swept away the very old process of *cessio bonorum* even as amended by the Debtors Act 1880, and introduced an entirely new system of "summary sequestration" for small estates. This process is competent when the debtor's assets do not exceed £300 (s. 174), and the petition must be presented to the sheriff. The procedure is in the main the same as in the case of an ordinary sequestration, with the sheriff taking the place of the lord ordinary, but there the several differences in detail which are set out in ss. 175 and 176 of the act.

The act also contains certain provisions for the punishment of bankruptcy offences (s. 178). It should be noted that failure to keep proper books will constitute such an offence.

The estate of an insolvent debtor may be wound up without a sequestration by a private trust deed for creditors. The Act of 1913 does not provide for this remedy and it depends upon the common law of Scotland. In such a trust deed the debtor conveys his property to a trustee with accession of some or all of his creditors. The trustee makes good his title to the property in the same way as any private person and then proceeds to divide the property. The trust deed may be reduced as a preference to creditors under the Act of 1696 if some creditor who has not acceded to it makes the debtor notour bankrupt within 60 days of the trust deed, and if sequestration is awarded the trust deed automatically falls. There is no provision in Scotland for the registration of private trust deeds.

COMPARATIVE LAW

Irish Bankruptcy Law.—The Government of Ireland Act 1920 provided that all laws in force in Ireland at the date of the act should remain in force unless modified by the parliaments of either Southern or Northern Ireland or in certain other specified ways. No modifications in the law relating to bankruptcy have yet been made (Jan. 1, 1928), so that branch of the law remains unaffected by the passing of the act.

The law is regulated by the two leading statutes of 1857 and 1872, together with the Irish Debtors Act 1872, and corresponds in its main features to some of the older English enactments, with modifications adopted from the English Act of 1869. A special act was passed in 1888 for establishing local bankruptcy courts in certain districts in Ireland, and an Act of 1889 applied the main provisions of the English Act of 1888, relating to preferential payments in bankruptcy, to Ireland.

In 1897 the court of bankruptcy was abolished and its jurisdic-

tion was vested in the queen's bench division of the supreme court of judicature in Ireland.

The Deeds of Arrangement Act 1887, though repealed as to England by the Deeds of Arrangement Act 1915, is still in force in Ireland and is supplemented by the Irish Deeds of Arrangement Amendment Act 1890. This last mentioned act requires the registration of all petitions for arrangement under the Bankruptcy Act 1857.

British Empire.—Of recent years great progress has been made in the consolidation of the law in the various parts of the British empire and especially is this the case with regard to the laws of bankruptcy. In Australia a consolidating act was passed by the commonwealth parliament in 1924 (Bankruptcy Act 1924, No. 37 of 1924) but its operation was suspended until a date to be fixed by proclamation. In New Zealand the law is consolidated by the Bankruptcy Act 1908 (Consolidated Statutes 1908, No. 12). All of these statutes follow closely the English Bankruptcy Acts. In South Africa the consolidating statute of the Union parliament is the Insolvency Act 1916 (No. 32 of 1916), which applies to the Cape of Good Hope, Natal, Transvaal, and the Orange Free State. In Canada the Dominion parliament passed the Bankruptcy Act of 1919, subsequently amended by Acts of 1920, 1921, 1922, 1923 and 1925.

There are two systems of insolvency law in force in India to-day, one applicable to the presidency towns and the other to the rest of the country. The first depends on the Presidency Towns Insolvency Act 1909 (Act III. of 1909) as amended by Acts X. of 1914, XI. of 1921, IX. and XXXIV. of 1926 and XI. and XIX. of 1927, and the second on the Provincial Insolvency Act 1920 (Act V. of 1920) as amended by Acts XIX. of 1925, IX., XXXIV. and XXXIX. of 1926 and XI. and XII. of 1927. Here again the English law has been the model.

The Indian Provincial Insolvency Act has been used as a convenient code of bankruptcy law for new colonies or territories. In Kenya Protectorate, for example, the Indian Provincial Insolvency Act 1907 was adopted as law by an Ordinance of 1910 (cap. 106) and still remains in force, although a separate code superseding the Indian Act was set out in the Bankruptcy Ordinance 1926 (No. 1 of 1926) which will come into force on a date yet to be fixed.

In other parts of the British empire English law is adopted specifically. For example, in Tanganyika territory by the Bankruptcy Ordinance No. 8 of 1920 English bankruptcy law as at the date of the ordinance is declared to be the law of the territory. In British Guiana, Gambia, Jamaica, Hong Kong, Mauritius, Grenada, Trinidad, Tobago, and the Straits Settlements the law is modelled on the English pattern.

France.—Bankruptcy in France is regulated by the Commercial Code of 1807, amended and supplemented by the law of June 9, 1838. By Article 437 of the code bankruptcy is defined as the state of a trader who is unable to meet his commercial engagements. Simple insolvency of this kind is known in France as *faillite*. Insolvency attended with circumstances of misconduct or fraud is known as *banqueroute simple* or *banqueroute frauduleuse*. Only a trader can become bankrupt. The debt, too, for obtaining adjudication must be a commercial debt, the laws regulating bankruptcy being designed exclusively for the protection of commerce. To be made a bankrupt a trader need not be insolvent; it is sufficient that he has suspended payment. Commercial companies of all kinds are liable to be declared bankrupt in the same manner as individual traders. A trader-debtor can be adjudicated bankrupt upon his own petition, or upon the petition of a creditor, or by the court itself *proprio motu*. A petitioning debtor must within 15 days file at the office of the tribunal of commerce of the district a declaration of suspension, with a true account of his conduct and of the state of his affairs, showing his assets, debts, profits and losses, and personal expenses. On adjudication the tribunal of commerce appoints a person, called a *syndic provisoire*, to manage the bankrupt's estate, and a *juge commissaire* is also named to supervise the syndic. A bankruptcy terminates by an ordinary composition (*concordat*), a sale of the debtor's assets (*union*), or a composition by relinquishment of assets. It is a striking feature of the French system, and highly creditable to French commercial integ-

urity, that a discharge in bankruptcy, even when accompanied by a *declaration d'excusabilité*, leaves the unpaid balance a debt of honour. At the time of the French Revolution the National Convention passed a resolution that any man who contracted a debt should never be free from liability to pay it. The spirit of this resolution still survives, for until a trader has paid every penny that he owes he is not rehabilitated and remains under the stigma of various disabilities; he has no political rights, he cannot hold any public office, or act as a stockbroker, or sit on a jury. *Banqueroute simple* is where the bankrupt has been guilty of grave faults in the conduct of his business, such as extravagance in living, hazardous speculation, or preferring creditors. *Banqueroute frauduleuse* involves the worse delinquency of fraud. Both *banqueroute simple* and *banqueroute frauduleuse* are punishable—the latter with penal servitude which may range from five to as many as twenty years. (See *The Commercial Laws of the World*, vol. xxi. p. 132 *et seq.*)

Germany.—Bankruptcy in Germany is governed by a code passed in 1877, as amended by a Supplementary Law dated May 17, 1898. Prior to this each State had its system and the law was "wholly chaotic." The same distinction is drawn in Germany as in France between mere commercial failure and bankruptcy, simple or fraudulent. Simple bankruptcy is established by such offences as gambling, dealing in "futures," disorderly book-keeping or extravagance in living; fraudulent bankruptcy, by offences of a deeper dye—the concealment of property, the falsifying of books, the manufacture of fictitious debts, and the giving of illegal preferences. Both kinds of bankruptcy are punishable, fraudulent bankruptcy by penal servitude or, in case of mitigating circumstances, by imprisonment for not less than three months. Accessories in fraudulent bankruptcies are liable to penal servitude—for instance, a creditor who conspires with the debtor to secure an advantage to the prejudice of the other creditors. The creditors are called together within one month from the date of adjudication, and at their meeting they may appoint a committee of their number to advise with the trustee. It is the duty of the court to see that the trustee performs his functions. Estates are liquidated with great rapidity. In order that the creditors may receive dividends at the earliest moment it is customary to sell the assets by auction. The creditors by a majority in number and three-fourths in value may accept a composition, but such an arrangement must have the approval of the court. The fees are very moderate: in an ordinary bankruptcy the attorney's fees do not, it is said, exceed £5. (See *The Commercial Laws of the World*, vol. xxiv. p. 265 *et seq.*, where an exhaustive statement of the German law of bankruptcy will be found.)

Italy.—Bankruptcy in Italy is regulated by the Commercial Code of 1883 (Part III.). Only traders can pass through the bankruptcy court. Traders are defined by the code as those who, as an habitual profession, engage in commercial business. This definition includes merchant companies. Bankruptcy proceedings may be taken either by the debtor or by a creditor for a *commercial* debt, or may be ordered by the court. The amount of the debt is immaterial: a small sum will suffice, provided its non-payment is proof of insolvency. Bankruptcy can only be declared where there is insolvency. The judgment adjudicating a debtor bankrupt deprives the bankrupt of the right to administer his affairs and nominates a trustee to realize the property under the superintendence of a judge and a commission of creditors. All the property of the bankrupt, movable and immovable, is sold by auction and distributed in dividends. This is one way of closing the bankruptcy, but it may also be closed by an arrangement. No minimum percentage is required for such arrangement, but it must have the assent of creditors representing three-fourths of the bankrupt's indebtedness. Composition before bankruptcy is not recognized by Italian law. Bankrupts are liable to criminal proceedings involving punishments more or less heavy for offences against the law, *e.g.*, for not keeping books in the way prescribed by law.

Spain.—The law of bankruptcy in Spain is to be found in the 4th book of the Commercial Code, ss. 870 *et seq.*, as modified by the law of June 10, 1897. (See *The Commercial Laws of the World*, vol. xxxii. pp. 212 *et seq.*) (W. V. B.)

BANKRUPTCY IN THE UNITED STATES

History.—The Constitution of the United States gives to Congress the power to establish "uniform laws on the subject of bankruptcies throughout the United States" (Art. I, s. 8). Prior to the act of 1898, there were three bankruptcy acts enacted by Congress in pursuance of this power—the acts of 1800 (2 Stat. 19), 1841 (5 Stat. 440) and 1867 (14 Stat. 517). These were repealed in 1803 (2 Stat. 248), 1843 (5 Stat. 614) and 1878 (20 Stat. 99), respectively. The present act was enacted in 1898 (30 Stat. 544).

Each one of the bankruptcy acts mentioned was enacted shortly after a period of business depression. The act of 1800 followed the depression and panic of 1797; that of 1841, the panics of 1837 and 1839; that of 1867, the post-war depression in the North and the economic chaos in the South; that of 1898, the panic of 1893 and the years of depression from 1894 to 1897. The failures during these periods were numerous. Each one of these acts made available to the bankrupt a discharge from his provable debts. While the act of 1800 did not permit a voluntary bankruptcy, the later acts did. And though the act of 1800 applied only to traders, the later acts did not thus discriminate. Thus, within limits, legal devices became available to debtors in the periods of acute economic stress and strain whereby they could wipe their slates clean and begin anew. The dates of the repeal of these first three acts are likewise significant. They mark either a period of prosperity or the beginning of one. Prior to 1898, then, national bankruptcy legislation was an emergency device. Only since 1898 has it had permanency.

In the long intervening period in which there was no Federal act, the States generally filled the gap in one of two ways. Some provided the machinery whereby creditors acting as a group could seize their debtor's assets and distribute them among themselves or whereby a debtor could get relief from payment of his debts by turning over his property to his creditors. The procedure in these States approximated to the procedure under the intervening Federal bankruptcy acts. Others merely made regulations governing the manner in which a debtor could pay his creditors where his assets were not sufficient to pay each creditor in full, but normally made no provision for group action by the creditors.

The first type of State laws mentioned was valid as long as there was no national or Federal bankruptcy act and in so far as the State law attempted to act or acted within constitutional limits. However, as soon as a national bankruptcy act was enacted, the comparable State laws were superseded and suspended by it in so far as the State law was incompatible or in conflict with the Federal act. In so far as the State law merely supplemented the Federal act and covered contingencies not covered by it, the State law was not superseded or suspended. And similarly, no State law will be permitted to interfere with the administration of the present Federal bankruptcy act. If there is a conflict, the latter prevails.

Major amendments were made to the act of 1898 in 1903 (32 Stat. 797), 1910 (36 Stat. 838), and 1926 (44 Stat. 662), and minor amendments in 1906 (34 Stat. 267), 1917 (39 Stat. 999) and 1922 (42 Stat. 354). These amendments for the most part were designed to remedy ambiguous provisions of the act and to cure defects which a few years of administration revealed. With these exceptions the act remains as originally enacted though repeated attempts have been made to repeal it *in toto*.

Operation.—The function of the present bankruptcy act is twofold: to effect, within limits, an equality of distribution of the assets of a debtor among his creditors; and, within limits, to make available to a debtor a discharge from his debts. These results are accomplished by means of rather simple administrative machinery. A debtor (with the exception of a municipal, railroad, insurance or banking corporation) may voluntarily petition for an adjudication in bankruptcy. There seems to be no major qualification to this privilege as long as the debts are legally owed. A debtor (with the exception of a wage-earner who works at a rate of compensation not exceeding \$1,500 a year, or a "person engaged chiefly in farming or the tillage of the soil," or a municipal, railroad, insurance or banking corporation) who owes debts to the amount of \$1,000 or more, may be adjudged an involuntary bank-

rupt on the petition of three or more creditors whose provable claims amount in the aggregate to \$500 or more, or on the petition of one of such creditors whose claim equals such amount if the creditors are less than 12 in number. Such adjudication does not follow as a matter of course, but only on showing that the debtor has committed an act of bankruptcy within four months prior to the filing of the petition.

The statute constitutes the following as acts of bankruptcy: (1) Fraudulent conveyances. In general any transfer by a debtor of his assets which a creditor could set aside under the early statute of 13 Eliz. c. 5 is an act of bankruptcy. The fraudulent conveyance normally takes the form of a gift of property to relatives or friends or a sale of property to one who pays but nominal consideration or who gives value but knows of the fraudulent scheme. (2) Preferences. A preference, as distinguished from a fraudulent conveyance, presupposes the relation of debtor and creditor between the person whose property is being appropriated and the person taking or receiving the property. The law apart from the bankruptcy act normally permits a debtor to prefer one creditor over the other even though the result is that the claims of the other creditor remain unpaid; but such preferential payment or transfer if permitted under the bankruptcy act would be quite inconsistent with the aim of the act to effect equality of distribution. The preference may take various forms and still be an act of bankruptcy. It may be a transfer by an insolvent debtor with intent to prefer. Or it results if the debtor, while insolvent, merely permits a levy or attachment to be made on his property and does not at least five days before a sale or other disposition of the property affected vacate or discharge the judgment or lien. Or again, it results if the debtor, while insolvent, permits a levy, attachment, judgment or other lien to be acquired and does not vacate or discharge the same within 30 days from the date of such levy, attachment, judgment or lien. (3) General assignments. Apart from the bankruptcy act the debtor could assign his property for the benefit of his creditors, such method of liquidation being lawful within limits. But courts administering bankruptcy laws have uniformly looked on that method of liquidation and distribution with disfavour; and under the present act it is an act of bankruptcy, even though the assignment is made by a solvent debtor. Thus creditors may keep under the courts' surveillance such payments to creditors and so secure the equality of distribution granted them by the bankruptcy act. (4) Appointment of a receiver or trustee. When a receiver or trustee has been appointed or put in charge of the property of a debtor while he is insolvent, there is an act of bankruptcy. The receiver is normally appointed by a State court on the petition of a creditor alleging, *inter alia*, that the debtor is insolvent. But the appointment of a receiver is not *per se* an act of bankruptcy though the appointment be for the reason that the debtor is insolvent. The reason is that the meaning of insolvency varies. The common law or equity meaning is an inability to pay debts as they mature; the bankruptcy meaning is an insufficiency in the amount of a debtor's property at a fair valuation to pay his debts. Thus a debtor may be unable to pay matured debts and yet be solvent within the meaning of the bankruptcy act provided his property (even including that property which is exempt by law from the payment of his debts) at a "fair" value is sufficient to pay his creditors. This is one reason why State receiverships are common, the proof of insolvency within the meaning of the bankruptcy act being comparatively more difficult. (5) The admission by a debtor in writing of his inability to pay his debts and his willingness to be adjudged a bankrupt on that ground. Here, as in the case of a general assignment, there may be technically an act of bankruptcy by a person who is solvent within the meaning of the bankruptcy act. The additional qualification to each of the above is that it was committed within four months prior to the filing of the petition by the creditors.

The petition is filed in that Federal district court having jurisdiction. An involuntary petition having been filed, the debtor is given an opportunity to appear and has the right to a jury trial on the questions of his insolvency and the commission by him of any act or acts of bankruptcy. The court after a hearing either makes an order of adjudication or dismisses the petition. If an

order of adjudication is made, the court normally refers the case to a referee. Referees are appointed by the court for a term of two years and are subject to removal by the court. Their compensation consists wholly of fees, regulated by statute, such fees being determined mainly in reference to the number of claims filed for allowance against the estate and to the amount of dividends paid out by the trustee. Referees are usually members of the legal profession. They are judicial officers. After a case has been referred to a referee, he has jurisdiction over every phase of the proceedings except questions arising out of application by the bankrupt for a composition or discharge, and except the power to commit for contempt. His orders, however, are subject always to a review by the court.

The case having been referred to the referee, he secures from the debtor a statement of the debtor's assets and liabilities. Creditors are given six months after the adjudication to file proofs of claims against the estate. Claims duly proved are allowed by the referee unless objected to by the trustee or creditors. Creditors holding valid security are allowed to prove for the amount of their claims in excess of the value of the security. The valuation of the security is made under court supervision.

Upon reference of the case to him, the referee calls a meeting of the creditors. At the first meeting of the creditors the trustee usually is elected, a majority vote in number and amount of claims of all the creditors present whose claims have been allowed being necessary to elect. If the creditors are unable to agree, the court or referee may appoint a trustee. The trustee is an executive officer whose fee is fixed by the court within a maximum fixed by statute. Instead of one trustee three may be appointed. It is the duty of the trustee to take possession of the property of the bankrupt and convert the property into cash.

This process of liquidation is facilitated by the provision of the act which vests in him the title to the bankrupt's property as of the date of the adjudication. The exception to this is that the trustee is not vested with the title to property which is exempt from the payment of debts by virtue of law. An additional qualification is that the trustee gets title not only to the property to which the bankrupt has title, but also to that property which the bankrupt has conveyed in fraud of creditors or which a creditor could reach under any State law had there been no bankruptcy. In that respect the extent of the trustee's right against the transferee of such property is measured in part by the laws of the various States. Likewise, the trustee's right is not restricted to such transfers as took place within the four month period preceding the filing of the petition but is governed by the statute of limitation in the respective States. On the other hand the State law is not the sole measure of the trustee's right to recover property conveyed by the bankrupt, for the trustee is specifically given the right to avoid preferential transfers. Such right obviously is essential for equality of distribution. The conditions qualifying the right to avoid such transfers are that the transfer or judgment be within four months of the filing of the petition and that the person receiving it or to be benefited thereby have reasonable cause to believe that the enforcement of such transfer or judgment would effect a preference.

All such property is converted into cash under the supervision of the court, and at stated intervals and in stated amounts dividends are payable on the order of the referee, until the estate is exhausted.

Limitations.—The actual distributive process does not effect complete equality of distribution. In the first place the debtor is allowed to retain property which the State law exempts. Further, the normal administrative expenses of the bankruptcy proceeding are payable in full in advance of the payment of any dividends. Next in order of priority are wages not exceeding \$600 each due to workmen, clerks, salesmen and servants, and earned within three months before the commencement of the bankruptcy proceeding. Then come taxes due to the Federal and State Governments, and various political subdivisions thereof. Next are debts owing to any person who by the law of a State or of the United States is entitled to priority. Only then are dividends payable.

From the debtor's point of view as well the act has some limitations. Thus a municipal, railroad, insurance or banking corpora-

tion may not become a voluntary bankrupt, such business having sufficient social significance to warrant a reorganization instead of complete dissolution and liquidation. On the other hand the limitation, noted above, on the right of creditors to an involuntary bankruptcy gives some protection to the proverbially poorer class of debtors.

Another limitation from the debtor's point of view is that the bankrupt is not entitled to a discharge as a matter of right and that a discharge is not given as a matter of course. Application must be made within certain time limits after the date of the adjudication. The trustee and creditors are given reasonable opportunity to oppose the discharge. If they do not oppose it, the discharge is granted. They may successfully oppose it by proving that the bankrupt has violated the penal provisions of the act; or destroyed, concealed, etc., books of account; or, in exceptional cases, failed to keep books of account; or obtained money or property on credit by making written false statements concerning his financial condition; or transferred property, with intent to defraud creditors, within 12 months preceding the filing of the petition; or received a discharge in bankruptcy within six years; or refused to obey any lawful order of the referee or court or to answer any material question approved by the referee or court; or failed to explain satisfactorily any losses or deficiencies of assets. But in the great majority of cases the discharge is available to the honest debtor. The charge sometimes made that bankruptcy is used by the fraudulent debtor to escape payment of his debts has some basis of truth. But the fault does not lie with the bankruptcy act. The provisions of the bankruptcy act for penalizing fraud are quite complete. The loophole for the dishonest debtor lies in the fact that proof of such practices is often difficult and in the fact that creditors are often apathetic in opposing a discharge. But the penal provisions relating to certain fraudulent practices furnish an additional deterrent. The evil in large part arises out of the ease with which the debtor gets credit in modern industrial society. Unwise credit extensions constitute an underlying cause. The preponderance of liabilities over assets makes bankruptcy seem desirable. Thus the credit system, and not only the debtor, is at fault.

The remaining limitation from the debtor's point of view is that even though a discharge is granted all debts are not thereby released. Only provable debts are dischargeable. But debts due as a tax levied by the Federal or State Government or a political subdivision thereof are not discharged. Nor are the liabilities of a bankrupt for certain fraudulent acts, wilful and malicious injuries, or certain immoral conduct discharged. In addition to the above are certain wages and moneys owing to employes, claims known to the bankrupt but not filed by the creditor because of his lack of notice or knowledge of the proceedings, and, of course, debts incurred subsequent to the filing of the petition. And all debts which are not provable are not discharged. What debts are not provable has been a question of extended litigation due to the ambiguous wording of the statute; but the claims against the normal business are provable and thus dischargeable. For that reason the limitation is quite unimportant.

See W. M. Collier, *Bankruptcy* (1898).

(W. O. D.)

BANKS, SIR JOSEPH, BART. (1743-1820), English naturalist, was born in London, on Feb. 13 1743. In 1764 he came into possession of the ample fortune left by his father, William Banks, M.P. for Peterborough, and in 1766 he made his first scientific expedition to Newfoundland and Labrador, bringing back a rich collection of plants and insects. Shortly after his return, Captain Cook was sent by the government to observe the transit of Venus in the Pacific ocean, and Banks, through the influence of his friend Lord Sandwich, joined the expedition in the "Endeavour," which was fitted out at his own expense. He was equally anxious to join Cook's second expedition and expended large sums in engaging assistants and furnishing the necessary equipment; but circumstances obliged him to relinquish his purpose. He, however, employed the assistants and materials he had collected in a voyage to Iceland in 1772, returning by the Hebrides and Staffa. In 1778 Banks succeeded Sir John Pringle as president of the Royal Society of which he had been a fellow from

1766, and held the office until his death. In 1781 he was made a baronet; in 1795 he received the order of the Bath; and in 1797 he was admitted to the privy council. He bequeathed his collections of books and botanical specimens to the British Museum.

See J. H. Maiden, *Sir Joseph Banks* (1909).

BANKS, NATHAN (1868-), American entomologist, was born in Roslyn, N.Y., on April 13, 1868. He graduated at Cornell university in 1889 and in 1890 entered the division of entomology of the United States department of agriculture. In 1916 he left this post to become curator of insects in the museum of comparative zoology at Harvard university. He made extensive researches on the distribution of insects and on protective resemblances and mimicry.

His publications include: *Treatise on the Acarina* (1904); *Catalogue of the Acarina* (1907); *Catalogue of Nearctic Neuroptera* (1909); *How to Collect and Preserve Insects* (1909); *Catalogue of Nearctic Heteroptera* (1911); *Index of Economic Entomology* (1917).

BANKS, NATHANIEL PRENTISS (1816-1894), American politician and soldier, was born at Waltham, Mass., on Jan. 30, 1816. He received only a common school education and at an early age began work as a bobbin-boy in a cotton factory of which his father was superintendent. Subsequently he edited a weekly paper at Waltham, studied law and was admitted to the bar, his energy and his ability as a public speaker soon winning him distinction. He served as a Free Soiler in the Massachusetts house of representatives from 1849 to 1853, and was speaker in 1851 and 1852; and, in 1853, was elected to the national House of Representatives as a coalition candidate of Democrats and Free Soilers. Although re-elected in 1854 as an American or "Know-Nothing," he soon after joined the Republican Party. In 1856, after a protracted contest, he was chosen speaker on the 133rd ballot. This has been called the first national victory of the Republican Party. Re-elected in 1856 as a Republican, he resigned his seat in Dec. 1857, and was governor of Massachusetts from 1858-61. In 1861 President Lincoln appointed him major-general of volunteers. In the spring of 1862 Banks was ordered to move against Jackson in the Shenandoah Valley, but the latter with superior forces defeated him at Winchester, Va., on May 25. On Aug. 9 Banks again encountered Jackson at Cedar Mountain, and, though greatly outnumbered, succeeded in holding his ground after a very sanguinary battle. In November, Banks sailed from New York with a strong force to replace Gen. B. F. Butler at New Orleans. In May, 1863, he invested the defences of Port Hudson, La., which after a regular siege surrendered July 9. In the autumn of 1863 Banks organized a number of expeditions to Texas, and secured possession of the region near the mouths of the Nueces and the Rio Grande. But his Red River expedition, March-May 1864, forced upon him by superior authority, was a complete failure. From 1865 to 1873 he was again a representative in Congress, serving as chairman of the committee on foreign affairs. A personal quarrel with President Grant led in 1872, however, to his joining the Liberal-Republican revolt in support of Horace Greeley. In 1874 he was successful as a Democratic candidate, serving one term (1875-77). Having rejoined the Republican Party in 1876, he was United States marshal for Massachusetts from 1879 until 1888, when for the ninth time he was elected to Congress. He died at Waltham on Sept. 1, 1894.

See Frank M. Flinn, *Campaigning with Banks in Louisiana, '63 and '64* (1887); and Charles Kassel, "The Labor System of General Banks," in *Open Court*, xli. 35-50 (1928).

BANKS, THOMAS (1735-1805), English sculptor, son of a surveyor who was land steward to the duke of Beaufort, was born in London on Dec. 29 1735. He was taught drawing by his father, and in 1750 was apprenticed to a wood-carver. In his spare time he worked at sculpture, and before 1772, when he obtained a travelling studentship and proceeded to Rome, he had already exhibited several fine works. He spent two years in St. Petersburg (Leningrad), being employed by the empress Catherine who purchased his "Cupid tormenting a Butterfly." On his return he modelled his colossal "Achilles mourning the loss of Briseis," a work full of force and passion. The monuments in St. Paul's Cathedral, London, to Captain Westcott and Captain

Burges, and in Westminster Abbey to Sir Eyre Coote are by him. His bust of Warren Hastings is in the National Portrait Gallery. Banks's best-known work is perhaps the colossal group of "Shakespeare attended by Painting and Poetry," now in the garden of New Place, Stratford-on-Avon. He died in London on Feb. 2 1805.

BANKS, HISTORY OF. Perhaps the earliest definition of a bank is found in "Lex Mercatoria" by Gerard Malynes, published in London in 1622. He says:—

"A Bank is properly a Collection of all the ready money of some Kingdom, Commonwealth, or Province, as also of a particular City or Town, into the hands of some persons licensed and established thereunto by publick authority of some King, Prince, or Commonwealth."

This definition was in all probability derived from the author's experience of the exchange banks, such as Rotterdam, Middelburg, Amsterdam and possibly Hamburg, and also from his knowledge of the famous Italian banks in Venice and Genoa. These latter banks were even in 1622 of great fame and antiquity. The Casa di San Giorgio of Genoa had gradually extended its commitments and powers, until it was not only a deposit bank but also acquired many of the functions and powers of the Government itself. In 1453 Corsica, Péra and the Genoese Black sea colonies were ceded to it, and according to Machiavelli, its administration was more efficient and less tyrannical than that of the State. In short, it had an honourable history until 1797, and it is arguable that it is a direct ancestor of the present Banca d'Italia (q.v.).

Venice saw the growth in the middle ages of a number of private institutions which gradually developed from money-changers to something very like the modern bank.¹ Their history was not so uniform as that of the Casa di San Giorgio and ultimately it was deemed necessary to found a "public bank." This was the Banco della Piazza del Rialto, which dates from 1584. Thirty years later the more famous Banco del Giro was founded, and the two combined in 1637. The new bank survived until 1806.

BANKING IN ANTIQUITY

Pastoral nations such as the Hebrews, while they maintained money-lenders, had no system of banks that would be considered adequate from the modern point of view. But as early as 2000 B.C., the Babylonians had developed such a system.

It was not the result of private initiative, at that time, but an incidental service performed by the organized and wealthy institution of the cult. The temples of Babylon, like those of Egypt were also the banks. "Two shekels of silver," runs a Babylonian document, "have been borrowed by Mas-Schamach, the son of Adadrimehi, from the sun-priestess Amat-Schamach, daughter of Warad-Enlil. He will pay the Sun-God's interest. At the time of the harvest he will pay back the sum and the interest upon it." It is evident enough that the priestess Amat-Schamach was merely the accredited agent of the institution. No doubt the clay tablet with the inscription corresponds to what we call negotiable commercial paper. Another document of the same period was certainly such. It runs: "Warad-Ilisch, the son of Taribum, has received from the sun-priestess Iltani, daughter of Ibbatum, one shekel of silver by the Sun-God's balance. This sum is to be used to buy sesame. At the time of the sesame-harvest he will repay in sesame, at the current price, to the bearer of this document."

At a much later period, about 575 B.C., private initiative had taken the lead in Babylonian banking. At that time we hear of an institution that has been compared to the Rothschilds of 19th century Europe—the Igibi bank of Babylon. Its last great head died at a time not far distant from the date just given. The records of this bank show that it acted as buying agent for clients; loaned on crops, attaching them in advance to insure reimbursement; loaned on signatures and on objects deposited, and received deposits on which it paid interest.

In Greece in the 4th century B.C., i.e., at the time of the great

¹See A. Andreades, *History of the Bank of England*; P. S. King and Sons.

commercial prosperity that brought on the Persian wars,—banking was well established. As in Babylon, there was no prohibition of interest taking, so that banking was free to develop as circumstances might permit. There was, no doubt, some concentration of functions in certain large institutions, but the different operations of banking were performed by various kinds of bankers. Thus, the *trapezitai*—the name is still used by Greek bankers—were those who received deposits on interest to administer as current accounts such as checking; the *kermatistai* were the equivalent of the mediaeval goldsmiths, their function being the testing of coins and the changing of them; the *dancistai* were the money-lenders. A well verified function of the banks of Greece was to prepare letters of credit on correspondents with a view to obviating the actual transport of specie in payment of accounts.

The private bankers, however, had no monopoly on most of these transactions, and indeed it is probable that, as in Babylon, private banks followed the temple banks by a long interval. The temple system seems to have included most of the typical banking operations, except, perhaps, those of changing and of assay. There is small doubt, in any case, that such great temples as those of Ephesus and of Delphi were the most powerful of the Greek banking institutions before the time when the progress of irreligion had destroyed the public sense of security in making temple deposits or in allowing priests to act as financial agents.

Yet the Greek private bankers never monopolized the business, for the public, or State, bank was everywhere to be found, as at Abdera, Sinope and Cyzicus, and the surviving records show that, except in times of national emergency, the private bankers had but little chance to get profit from the financial transactions of the State.

The Greek system influenced Rome to the extent that certain Roman temples engaged in financial transactions for individuals. The College of the Flamens is known to have been entrusted with carrying out a will wherein was inserted a clause that turned over to it the ownership of the estate in question unless the heir should comply with a certain stipulation. The document is of particular interest because it shows a sense of absolute confidence in the integrity of the Flamens. But Roman legislation was inclusive on all such subjects, and fraud in banking was a matter of the greatest difficulty. In 210 B.C. we find the earliest definite regulations as to Roman private bankers—an ordinance which assigned the places in the Forum where the *tabernae argentariae*, or banking offices, might be located. The Romans did not follow the Greeks in the organization of State banks. But their minute regulations as to the conduct of private banking were calculated to create the utmost confidence in it; it touched all of the various divisions of the business, which were typically assumed by different individuals, as in Greece.

Hellenistic Egypt, unlike Rome, imported the Greek banking system bodily. On the one hand we find a private bank in Alexandria operating at night, when vessels could best come to anchor in that port, and displaying, as a sign, a little poem especially ordered from a famous bucolic poet. On the other hand, the State banks were as widely distributed as they were in Greece; their organization, each with a director, a sub-director, and a responsible manager, whether at Memphis, Thebes or Arsinoë, is well known. Everywhere, it appears, the State and private banks managed to exist together. In one little village, that of Dionysias, near Lake Moeris, there were two private banks in A.D. 151. One was that of Palamedes and Company "ἀπὸ τῆς Παλαμῆδους καὶ μετόχων τραπεζίης Διονυσιάδος," as a somewhat mutilated papyrus has it. The title occurs in a receipt for rent paid in to the bank for the account of a land-owner. (cf. Westermann and Kraemer, pp. 215-17.)

With the end of the civilization of antiquity banking degenerated, for a period of some centuries, into a system of financial makeshifts. There were various reasons for this, the most important, no doubt, being administrative decentralization and the weakening of governmental authority, with its inevitable counterpart of commercial insecurity. The very widely distributed means of banking brings out the prevalence of this insecurity in a striking manner: as in Babylon, in Egypt and in Greece the sanctuaries

were the banks. But if the phenomenon appears a similar one in those ancient countries and in mediaeval Europe it shows, upon analysis, fundamental differences. The ancient State was strong, whereas the mediaeval one was weak; and although the Christian churches and monasteries represented the mediaeval State religion, still, the Church in each country was no stronger than the State in question. Therefore there could be no such absolute guarantees for depositors in Church treasuries as had been common to those who used the temples as banks in antiquity.

But there was a certain guarantee—that furnished by the practical unanimity of opinion as to the inviolability of sacred buildings—and this was accepted as the best available one. The result was that people entrusted the officials of churches and monasteries with their money, either as a deposit to be withdrawn or as a cash payment for a stipulated annual income, whether perpetual or for a term. As for receipts calling for periodic payments by a church treasury, they came to be the most widely distributed of European commercial paper, and ranged through all denominations; they were negotiable, and as such were often divided into infinitesimal sums for the purpose of marketing them with poor investors. The order of the Templars (c. 1118–1320) became the outstanding representative of ecclesiastical banking and its records show that its operations included almost every type of the modern bank's activities, including those of the trust company.

The relative lack of commercial security, and especially outside the Church, was not the only reason for the slow development of lay banking. Pagan theory had gained precedence in Europe over Pagan practice. Aristotle's dictum that interest taking is unnatural and consequently immoral was remembered, and it was forgotten that the ancient world, the Hebrews included, made no sin of interest but only of usury. The Church, indeed, made the distinction; but governments—excepting those of Lombardy and of Cahors—generally forbade their nationals engaging in the operations which are associated with banking. However, growing necessity forced the issue: in 1148 the San Giorgio bank was formed in Genoa; and in 1157 the Vitale was constituted in Venice by a forced loan to the State, the loaners being empowered to organize as a bank. In 1407 a similar institution was founded in Genoa. In 1609 a municipal bank was opened in Amsterdam, where, however, no interest was paid on deposits, the purpose of the bank being rather that of a place of safe deposit under the city's guarantee.

ENGLISH BANKING

Until the 17th century, there was a lot of indefinable banking carried on elsewhere in Europe, though it is impossible to separate deposit banking from investments in trading ventures, money-changing and other commercial transactions of the period. The Fuggers undoubtedly did a lot of general financing, while the North-European exchange banks alluded to above, performed many of the functions of the modern bank, and may be regarded as being the linear ancestors of the great London merchant banking and accepting houses of to-day. In England, it is probably true to say that the ground was prepared for modern banking by the influx of gold from America in the Elizabethan age and the simultaneous birth of foreign trade. Land ceased to be the only form of wealth, and the country gentleman and town merchant began to hold part of their "capital" in cash. The final impetus was given by two political facts. The first was the seizure by Charles I. in 1640 of £130,000 in bullion deposited by City merchants at the Tower. The second was the outbreak of the Civil War, and the consequent sense of insecurity that spread throughout the country.

To secure safety, owners of money began to deposit it with the London goldsmiths. Against these sums the depositor would

receive a note, which originally was nothing more than a receipt, and entitled the depositor to withdraw his cash on presentation. Two developments quickly followed, which were the foundation of "issue" and "deposit" banking, respectively. Firstly, these notes became payable to bearer, and so were transformed from a receipt into a bank-note. Secondly, inasmuch as the cash in question was deposited for a fixed period, the goldsmith rapidly found that it was safe to make loans out of his cash resources, provided such loans were repaid within the fixed period.

The first result was that in place of charging a fee for their services in guarding their client's gold, they were able to allow him interest. Secondly, business grew to such a pitch that it soon became clear that a goldsmith could *always* have a certain proportion of his cash out on loan, regardless of the dates at which his notes fell due. It equally became safe for him to make his notes payable at any time, for so long as his credit remained good, he could calculate on the law of averages the exact amount of gold he needed to retain to meet the daily claims of his note-holders and depositors.

The cheque came in at an early date, the first known to the Institute of Bankers being drawn in 1670, or so. Hoare and Co. the only private banking firm left in London, who are directly descended from goldsmiths of that name, have in their possession a cheque dated July 11, 1676. It reads.—

Mr. Hoare,
Pray pay to the bearer hereof Mr. Witt Morgan fifty-four pounds ten shillings and ten pence and take his receipt for the same.
Your loving friend
Will Hale.

54/10/10
for Mr. Richard Hoare
at the Golden bottle in Cheapside.

This, and further interesting documents were published in the *Banker's Magazine*, Oct. 1927.

Here we have the early elements of both issue banking, which centres round the bank-note, and deposit banking, which centres round the cheque. In the one case, the banker is bound to pay gold against his notes, in the other against his deposits. The amount of gold he had to hold had still to be determined by experience, and Bank Acts, fiduciary issues and Treasury minutes were as yet unheard of.

The first shock to English banking came in the days of Charles II., who, several hundred years ahead of his time, borrowed heavily from the goldsmiths and promptly repudiated his loans. This occurred in 1672, and occasioned a general suspension of payment. Despite this incident, and a general (and well-founded) belief that the goldsmiths were guilty of imprudence and usurious practices, public confidence was restored, and it was soon after that date that the goldsmiths found that they could receive money on what is now termed "current account," i.e., money withdrawable without notice. Some 20 years later came the foundation of the Bank of England (q.v.).

The Bank of England.—The Bank of England took its origin partly in the public distrust of the goldsmiths, but mainly in the current impecuniosity of the British Government. In return for a loan of £1,200,000, the founders of the Bank were granted certain valuable privileges, which were added to as time went on. It kept, and still keeps, the accounts of the Government. It had what was then the unique privilege of being a joint stock company with limited liability. Its notes, though not yet legal tender, were accepted without question in payment of taxes. These made it a formidable competitor to the comparatively small private banking firms which had grown up from the London goldsmiths and to the country firms, such as Smiths' of Nottingham, which were already coming into existence.

The 18th century was the hey-day of the private banker and of the issue bank. The Bank of England Act of 1708 prohibited any other bank with more than six partners issuing "promissory notes," i.e., bank notes. The cheque, though in existence, was still in its infancy and was not universally accepted as it is in England and the United States to-day. The Act assumed that a bank must have the right to issue notes, or it ceased to have any

justification for its existence—in fact “to be a bank.” For over a century this assumption remained correct, and so the Act carried into effect its real intention of conferring a monopoly over banking upon the Bank of England.

During all these years, the Bank of England was nothing more than an ordinary bank of issue and deposit. It had certain privileges which gave it a favoured position, but in return refrained in practice from competing with the private bankers for deposits at interest from the public. It was in no respect a central bank in the modern sense of the term.

THE LONDON CLEARING HOUSE

Probably the most important landmark in the 18th century was the birth of the London Clearing House, and this in its turn marks the growth in the use of the bill, draft, cheque and similar negotiable instruments. Each bank in London employed clerks whose duty was to “walk” round the whole circuit of every other bank and present all cheques, etc. drawn thereon or domiciled there for payment and collect the money so due. This was a wearisome business, and about the middle of that century the walk-clerks gradually agreed to meet and offset all their cheques and bills against each other and pay over the balances. This practice was of course unofficial, but in time it was officially recognized, and in 1810 a house was rented for the clearing.

The system was originally limited to banks in close proximity to the Clearing House, in fact to what to-day is known as the “Town” clearing. “Country” clearing was added in 1858, and “Metropolitan” clearing in 1907. The reader will be familiar with the letters “T,” “C” or “M” which appear on all cheques and denote to which clearing they belong.

From this unofficial start, the London Clearing House has grown to its present dimensions, while provincial clearing houses have also been set up in the British Provinces. The expansion in the volume of London clearings, due before the World War mainly to the substitution of cheques for notes as a means of payment, is shewn below. The table also shews how the number of clearing banks has been reduced by amalgamations.

Year	Number of Clearing Banks	Total Clearings £
1830	29	954,401,000
1890	19	9,150,269,000
1906	18	12,711,334,000
1926	10	39,825,000,000
1927	10	41,551,000,000

It will be seen that only a limited number of banks are members of the “London Clearing.” Other banks have to “clear” through a member who acts as their agent.

The 18th century also witnessed the coming into universal use of the bank-note. Bank of England notes were received practically everywhere, while the notes of any London or country banker were usually acceptable.

The 18th century closed with the Napoleonic wars. These quickly imposed a severe strain upon the national finances and shewed the weaknesses of the existing British banking system. Its chief defect arose directly from the privilege conferred on the Bank of England by the limitation of joint-stock banking. No strong banking company could be founded in the country districts, but any private individual, whatever his lack of capital, knowledge or experience, could call himself a banker, accept deposits and issue notes. The Napoleonic wars exposed the instability and dangers of the whole system. Following a run upon the Bank of England, in 1797 Parliament suspended specie payments and made the Bank of England notes inconvertible. This was England's first experience of a purely paper currency, and it lasted till 1821. In 1814–16, a severe crisis occurred and many country banks had to suspend payment. Even after the return to gold in 1821, the period of strain was not over. The rapid development of industry at home and the opening up of new countries abroad stimulated a period of speculation which culminated in the crash of 1825. In normal times, the majority of private bankers were perfectly capable of carrying on their business. Despite their lack of experience, they knew their customers, and their customers

knew and trusted them. Their notes circulated freely, with the result that they could readily discount their customers' bills, and even participate in the development of local industry. It was only when a general crisis arose that the country banker would realize the danger of his position. The year 1824–25 tells many a tale. First the banker would tentatively “shorten sail” thereby arousing the wrath of his clients. Next a feeling of insecurity would arise, whence no man knew. The banker would quietly seek to get in more of his loans and at the same time apply to his London agents for help. Back would come the reply from the London banker that all his country clients were seeking to rediscount their paper, and that he had to guard his own funds. Money was tight and the Bank of England was discouraging fresh borrowing. Finally came the run on the country banker, the crowd of note-holders jostling before his counter, the ever dwindling stocks of gold and Bank of England notes, and the racking suspense which lasted until either the gold held out and the corner was turned, or he was forced to put up the shutters.

MODERN ENGLISH BANKING

The crisis of 1825 marked a turning-point, and tolled the death-knell of the small country bank and of the note as the foundation of the banking system. Legislation quickly followed. In 1826 joint-stock banking (with unlimited liability) was permitted outside a radius of 65 miles from London, and at the same time the issue of bank-notes of less than £5 face value was prohibited. In 1833, the monopoly of the Bank of England was breached to the extent that joint-stock banking was permitted within the 65 mile radius, but without the right of issuing notes. This qualification was of minor practical importance, for it was already clear that the note was to be replaced by the cheque, and that deposit as opposed to issue banking could be made a paying business. In 1834, the London and Westminster and London and County Banks were founded, and though cold-shouldered by the London private banking firms, rapidly established themselves, and when they had fought their way into the London Clearing House, as they did at an early date, their position was secure.

Meanwhile the Bank of England was to undergo a series of radical changes, which were to transform it from its old position of being the foremost issue and deposit bank in the country to its present position of being a Central Bank in the modern sense of the word. The crises of 1829, in which the Bank had to borrow from the Banque de France to meet the demands of the public, forced the Government to take action, and there followed Peel's famous Bank Act.

The Bank Act.—This measure divided the Bank of England virtually into two banks—issue and deposit. The sole duty of the issue department was to issue bank-notes, and the fiduciary part of the issue was limited to the original Government debt of £14,000,000. Permission to exceed this limit could only be given by the Prime Minister and the Chancellor of the Exchequer acting conjointly, this forming the famous operation known as “suspending the Bank Act.” The issue of notes by private or joint-stock banks was limited to those who already had and exercised the right, and to the average amount outstanding in the first quarter of 1844. If a bank, by reason of coming to London or absorption by another bank, lost its right to issue notes, the Act empowered the Bank of England to increase its fiduciary issue by two-thirds of the lapsed private issue. It may be added, as a matter of historical interest, that the last English country bank lost its right to issue as late as 1920, and that since that year the Bank of England's fiduciary limit has stood at £19,750,000.

The Birth of “Big Five.”—Meanwhile, the nuclei of the “Big Five” were growing up. A union of private banks gave birth to Barclays, Birmingham saw the rise of Lloyds and of the Midland, while the National Provincial found its origin at Gloucester. The twin birth of the Westminster, in the shape of the London and County and London and Westminster banks, has already been mentioned. During the 19th century, this growth continued, taking the double form of the absorption of smaller banks, and the opening of new branches. The 20th century amalgamations were

but the culminating point in a process which had been going on for many years before.

The following is a very brief history of the great banking institutions familiarly known as the "Big Five":—

(1) *Barclays Bank, Limited*, was established as a private bank early in the 18th century and became a joint-stock company in 1806 as the result of an amalgamation of twenty private banks. In 1916 it absorbed the United Counties Bank, in 1918 the London Provincial and South-Western Bank (itself an amalgamation of the London and Provincial and London and South-Western Banks), and has since acquired one or two small country banks and also the control of the Union Bank of Manchester. In Scotland, it has acquired the British Linen Bank, while abroad it owns Barclays Bank (France), Barclays Bank S.A.I. (in Italy), and Barclays Bank (Dominion, Colonial and Overseas), which includes the Anglo-Egyptian Bank and the National Bank of South Africa.

(2) *Lloyds Bank, Limited*, was founded in 1765 and became a joint-stock company in 1865. In 1918 it amalgamated with the Capital and Counties Bank, and a year later acquired the West Yorkshire Bank. In Scotland, it owns the National Bank of Scotland, and abroad it controls the Bank of London and South America. Among other absorptions of interest is that of Messrs. Cox and company, the famous army agents. In conjunction with the National Provincial Bank, it owns Lloyds and National Provincial Foreign Bank, operating in France, Belgium and Switzerland.

(3) *Midland Bank, Limited*, was established in 1836, and in 1918 amalgamated with the London Joint-Stock Bank. In Scotland it owns the Clydesdale Bank and the North of Scotland Bank, and in Ireland it owns the Belfast Banking company. It has no overseas branches or subsidiaries.

(4) *National Provincial Bank, Limited*, was established in 1833, and was registered as a limited company in 1880. In 1917 it amalgamated with the Union of London and Smiths Bank, and in 1920 it acquired the control of Messrs. Coutts and company. In the course of its history it has absorbed numerous country banks, the most famous perhaps being Prescotts Bank, itself a union of many west country banks. It has no direct interests in Scotland and Ireland, while its foreign interests are referred to above under Lloyds Bank.

(5) *Westminster Bank, Limited*. The London and Westminster Bank was established as a joint-stock bank in 1834, and the London and County Banking company two years later. Both were registered as limited in 1880, and amalgamated in 1909. Parrs Bank was founded in 1865, and the final union between it and the London County and Westminster took place in 1918. Among well-known country banks now incorporated in the Westminster Bank are Stuckeys of Bristol and the West, Cromptons of Derbyshire, Becketts of Yorkshire and the Nottingham and Nottinghamshire Banking company. In Ireland it owns the Ulster Bank, while its subsidiary, the Westminster Foreign Bank, operates in France and Belgium.

To return to London, Peel's act did not put an end to banking crises. Three times in the 19th century the Bank Act was suspended; in 1847, following the "railway mania"; in 1857, on which occasion alone the Bank had to take advantage of the suspension and issue notes in excess of its fiduciary limit; and in 1866. In this last year, the bank rate was raised to 10%, in an attempt to draw money from the Continent and so to ease the pressure. The attempt proved vain. Continental bankers for some time thought that the "suspension of the Bank Act" meant a suspension of cash payments or a moratorium, and even when convinced to the contrary, roundly said that if a first-class London acceptance sold at a discount rate of 10%, there must be "something wrong somewhere." Paradoxically enough, the Bank of England had to lower its rate before it could restore confidence abroad and attract foreign money to London.

It was about this time that the Bank of England began to assume its present functions of a Central Bank. Mr. Walter Leaf, in *Banking*, ascribes this change to the writings of two famous financiers. In 1860, Goschen in his celebrated *Theory of the Foreign Exchanges* shewed how the bank rate could be used to

influence the course of the foreign exchanges, the movement of gold to and from the country, and so the contraction or expansion of credit. Thirteen years later, Bagehot convinced the directors of the Bank and the financial world at large of the changed position of the Bank of England. Imperceptibly, the Bank had ceased to be a rival to the deposit banks of the country, and had become the custodian of their balances and the guardian of the nation's credit. Henceforward, the governing factor in its policy had to be, not the earning of profits for its shareholders, but the maintenance of a cash reserve, which though unremunerative to its owner, would be sufficient and more than sufficient to meet the probable demands of the nation.

Meanwhile, legislation was extending the scope of the joint-stock bank, and in accordance with the Bank Act of 1844, each such extension brought about a contraction in the private bank-note issue, and so helped the change-over from issue to deposit banking. In 1858, joint-stock banks were permitted by law to assume limited liability. For a time the permission was mainly of nominal effect, for there was a general belief that the voluntary continuance of unlimited liability added to the prestige and goodwill of a bank. In 1878, this belief was to receive a rude shock. In that year, the City of Glasgow bank failed, and all the stock holders were liable to the depositors to the full extent of their means.

The natural result was that no bank could obtain new capital, and to remedy this a fresh Companies' Act was passed in the following year. Henceforward unlimited liability only attached to bank-notes, which already were a diminishing quantity. It also followed that limited liability became an asset rather than a reproach to the banks, for its adoption rendered it easier for them to raise fresh capital. In point of fact, at the outbreak of the World War most banks were over- rather than under-capitalized.

It is now necessary to leave purely internal banking, and to trace the part played by the banks in the field of foreign trade. Originally, foreign trade was financed by the great Continental Exchange Banks, such as the Bank of Hamburg and Bank of Amsterdam. These were not issue or deposit banks, but primarily money-changers, though an important and growing function was the financing of trading ventures out of the capital of their proprietors. Their lineal descendants in the City of London are the great merchant bankers and accepting houses of to-day.

Until the end of the 18th century, Amsterdam was the great international finance centre, but at that time the Bank of Amsterdam fell upon evil days, while the Napoleonic wars completed the destruction. Many of the big finance houses migrated to London, and since then the famous London houses, such as Rothschild's, Barings and Lazard's, have reigned supreme. For the whole of the next century, the financing of the growing overseas trade was in their hands. Their acceptance gave the hall-mark of respectability to an obscure foreign bill, and rendered it saleable in the London money market. It was mainly their representatives who dealt in foreign currencies "on 'change." A foreign merchant needing a London credit, a foreign Government wishing to float a loan naturally applied to them. The British banks kept outside their business, and frankly admitted they did not understand it. A British bank would discount internal bills for its customers, but would only buy foreign bills through the money market, and these had to be "clean" and carry at least one first-class name.

There were, it is true, two sets of rivals to the Accepting Houses. First came the foreign banks, which opened offices in London, and on the whole received a cordial welcome. Next came the great Eastern "Exchange Banks," and these had the financing of the Far Eastern trade largely in their hands. The London offices of the Dominion Banks also had their full share of financing Empire trade.

One point must be emphasized. The Accepting Houses and Merchant Bankers do not as a rule accept deposits. The money they employ is almost entirely their own.

This was the position in 1914. The private banking house was not dead, but joint-stock banking, with limited liability, was the preponderating element. The Bank of England controlled the

great majority of bank-notes then outstanding, but gold was still diffused throughout the banks and the public at large. Amalgamations had reached the point where the final step could be taken, but numerous independent concerns were still in existence. Finally the banks largely confined their attention to home trade, and, while holders of foreign bills, left the "spade-work" to the foreign banks and London Accepting Houses.

Banks and the War.—The first effect of the outbreak of war in 1914 was an immediate strain upon the resources of the Bank of England, necessitating the suspension of the Bank act, the raising of bank rate to 10%, and the proclamation of a four days' bank holiday. The second was the institution of £1 and 10s. currency notes, which were made legal tender and were issued upon a largely fiduciary basis. This in effect has meant that the Bank act has remained suspended (1928). The third was a general moratorium which lasted for some time, while special arrangements had to be made for the accepting houses, which were prohibited from collecting the sums due to them from belligerents. This was done by providing that their acceptances, as they fell due, should be taken up by the Bank of England and put into "cold storage."

The war history of banking is inseparable from general financial history. The demands of the Government for money overshadowed everything. For patriotic reasons, the Banks had to take up large holdings of war loan, and also finance by over-draft their customers' purchases of stock. Over and above this came the gradual increase in the floating debt and in indirect inflation.

Whether the Government borrowed by issuing Treasury bills or by "ways and means" advances from the Bank of England, the ultimate effect was much the same. The money so raised was disbursed by the Government to its creditors of one kind and another, and was paid by them into their accounts at the different banks. Hence, deposits grew with the floating debt, while in so far as money was raised direct from the Bank of England, the immediate result was an increase in the joint-stock banks' balances at that institution, which form the basis of bank credit. Hence loans to the public and also deposits could be multiplied several times for each such advance by the Bank to the Government. Notwithstanding the intensive production of all kinds of commodities during the war, this multiplication of credit had the inevitable effect upon prices and wages, and when the peak was reached some 18 months after the close of hostilities, wholesale price index numbers stood at about three times their 1913 level.

The war witnessed one or two important changes in the banking world itself. First and foremost comes the final amalgamations, resulting in the appearance of the "big five." Next came the concentration at the Bank of England of the gold formerly in the hands of the banks and the public, who received in exchange bank and currency notes. The German banks disappeared from London, while foreign finance houses began to demand that London bills should carry the name of a British bank. This forced the British banks into what was to them the new fields of foreign bills and foreign trade, and to-day "acceptances" are a prominent item in our bank balance-sheets. Immediately after the war, the "big five" started opening up branches on the continent, and also affiliating with or obtaining control over Dominion and Colonial banks. They had already acquired control over certain famous Scottish and Irish banks, such as the British Linen Bank and the Ulster Bank.

It may be added that the banks to-day form the chief element in the London Foreign Exchange market. The bi-weekly meeting "on 'change'" was abandoned in 1921, and dealings in foreign currencies now take place by telephone between the banks, finance houses and similar institutions. Even the bill of exchange no longer possesses its former importance. Many transactions are settled by cable drafts (called "telegraphic transfers" or T.T.) or cheques drawn by a British bank upon its balance with agent in the country concerned. This again is a war and post-war development. The trade depression of 1921 and onwards created a new set of problems for the banks. To begin with they were violently attacked as being the authors of deflation and industrial depression, while all along the real responsibility rested with the

Government, who were obtaining huge budget surpluses and applying them to the reduction of the floating debt, thereby reversing the war process of inflation described above. In fact, at the time when these attacks were the most violent, bankers were experiencing extreme difficulty in liquidating the huge mass of their "frozen loans," which was the direct result of the trade slump. Their losses, though unrevealed, must have been enormous, but against these they could set the increase (also unrevealed) in the values of their holdings of Government stock, resulting from the simultaneous improvement in the national credit.

The Gold Standard.—Banking opinion in England was on the whole favourable to the restoration of the gold standard. It is true that the Bank Act was still virtually suspended, or rather ceased to be of practical importance. The nation has learnt to prefer paper to gold, while the power foreign bankers have of drawing gold from the Bank of England gives all the advantages of a full gold standard, and allows the Bank to perform its normal function of regulating discount rates and the foreign exchanges, as defined by Goschen in 1860.

Despite the amalgamations, banking competition in England is even fiercer than before, as is shown by the following official table:

	Number of banking offices			Number of inhabitants per office.		
	1844.	1906.	1925.	1844.	1906.	1925.
England and Wales	976	5,547	9,100	16,307	5,885	4,262
Scotland	368	1,180	1,563	7,120	3,790	3,162
Ireland	180	777	1,293	45,417	5,738	3,518

It is also admitted by the banks that it takes longer to-day for a new branch to become remunerative than it did before the war.

It is not true that the banks are restricting loans unduly. In Aug. 1927, advances to customers equalled 55% of deposits, whereas 50% is regarded as a normal proportion.

SCOTTISH BANKS

In 1695 the Scottish parliament passed an Act establishing the Bank of Scotland. This, though contemporaneous with the Bank of England, was given wider privileges, for it received the exclusive right to carry on the business of banking for 21 years, and not only had to give no consideration in return, but was expressly forbidden to lend money to the king.

In addition to issuing notes, the Bank of Scotland began at an early date to accept money on deposit and current account, a record of the last-named being found in 1729. Early in that century the Bank, the head office of which was at Edinburgh, made sporadic attempts to found branches in other Scottish burghs, but it was only in 1744 that these proved successful. By this time, the next Scottish bank, called the Royal Bank of Scotland, had established itself, while in 1746, the year after the invasion of the Young Pretender, came the British Linen Company. Henceforward, banking in Scotland was an old-established and highly competitive business.

There is little doubt that Scotland had one great advantage over England in these early years, and that was that there was no law restricting the foundation of joint-stock banks as was the case in England. The result was that whereas all country business in England perforce fell into the hands of numberless small private bankers, of varying capabilities and experience, banking in Scotland remained in fewer but stronger hands. Nor were the public starved of banking facilities, for branches were rapidly established, and in 1844 there was one banking office to every 7,000 people in Scotland as against a ratio of 1: 16,000 in England.

The strength of Scottish banking was proved in the crises of the Napoleonic wars and the following years. Only one failure occurred, and even here the creditors were ultimately paid in full.

The Scottish note issue came within the scope of Peel's act of 1844. A definite limit was laid down, and every note issued above that limit had to be fully covered by gold. The amount of specie thus to be held was to be dependent upon the average amount of

notes issued during the four weeks preceding April 25, 1844. One result of this restriction was that since that date no important bank has been established in Scotland. The reason is that in the 19th century, the right to issue notes was still in Scotland an essential to a successful banking business.

Despite its previous immunity, Scotland did not escape the major crises of 1847 and 1857, while allusion has already been made to the failure of the City of Glasgow Bank in 1878. Progress was in general similar to that made in England, and from 1844 to 1906, the number of banking offices grew from 368 to 1,180. Notes circulated freely in Scotland, but were not legal tender in England, and most British banks made a small charge for changing them.

The World War had similar effects in Scotland as in England. As part of the general measures to relieve the pressure for currency, Scottish bank notes were made legal tender, though this privilege was withdrawn after the conclusion of hostilities. The introduction of currency notes, of course, made its effect felt in Scotland as in England.

Since the closing years of the 19th century Scottish and English banks have naturally drawn closer together. Many of the Scottish banks opened London offices, and on its foundation Scottish banks were admitted to the British Bankers' Association. More important still, the amalgamation movement initiated by the war spread to Scotland, and some of the "big five" have acquired the control of famous Scottish banks. The British Linen bank is now affiliated to Barclays, while the Midland bank has the control of the Clydesdale bank.

IRISH BANKS

The early history of banking in Ireland was marked by legislation even less favourable to the formation of a steady and dependable system than in England, and in 1695 several of the principal merchants in Dublin met together for the purpose of forming a public bank for Ireland on the model of the Bank of England. For many years this proposal met with no favour. It was not till 1783 that the Bank of Ireland was established and commenced its business. The first governor was David La Touche, junior, and two other members of his family were amongst the first board of directors. The bank met with very great success, but the jealousy against rival establishments was extreme. By the Act forming the Bank of Ireland it was enacted that no company or society exceeding six in number, except the Bank of Ireland, should borrow or take up money on their bills or notes payable on demand. In the year 1821 the Act was so far modified as to permit the establishment of banking companies exceeding six in number at a distance of 50m. from Dublin. In 1824, in consequence of the ambiguity of that Act, an Act had to be passed to explain it. It was not till 1845 that the restriction as to the 50m. limit was withdrawn.

The establishment of any other bank but the Bank of Ireland was for a long time hindered by the legislation on the subject. Some of the restrictions were so extraordinary that it will be interesting to refer to three of the more important acts.

1741, 15 Geo. II.—Partnership authorized for the purpose of trade and manufacture; but such partnerships were not to exceed nine in number, nor was the capital stock of such co-partnership to exceed, at any time, the sum of £10,000.

1780-1781, 21 and 22 Geo. III.—"Anonymous Partnership act"—limited liability not to exceed £50,000, but "business of banking or discounters of money" expressly excluded.

1750, 33 Geo. II.—By this act a person while he continued a banker could not make a marriage settlement on a son or daughter, a grandson or granddaughter, so as to be good against his creditors, though for a valuable consideration, and though such creditors were not creditors at the time the grant was made. This act gave power to creditors over all conveyances by bankers affecting real estates; and all dispositions after May 10, 1760, by bankers of real or leasehold interest therein to or for children were made void as against creditors, though for valuable consideration and though not creditors at the time. No banker to issue notes or receipts bearing interest after May 10, 1760.

The number of banks which failed in Ireland in earlier times was extraordinary; thus Sir Robert Peel in his speech of June 9, 1845, on the Bank Act of that year, made a quotation "from the report of the committee of Irish exchanges, which sat in 1804. At that period there were 50 registered banks, but they all failed, and their failures, I know personally, led to the most fearful distress." Since the legislation of 1845, however, the business has been carried on with equally extraordinary steadiness and success.

The earlier history of banking in Ireland pursued very closely the same process of development as in England. Circulation preceded and fed deposits. The credit which the banks obtained by the ready acceptance of their notes brought customers to their counters, and thus existing system, fortunate in excellent managers, was built up gradually and surely.

Irish banks came in for their full share of the political troubles from 1916-23. Apart from the institution of the frontier between Northern Ireland and the Irish Free State, which created several new problems, many branch banks suffered damage in the disturbance. For all that, progress has been made, and the banks have taken their share in the work of financial reconstruction following the inauguration of the Free State in 1922.

The "big five" have also extended their activities into Ireland. To quote one example, the Westminster Bank acquired the control of the Ulster Bank during the war.

CONTINENTAL BANKING.

France.—With the exception of the Banque de France (*q.v.*) modern French banks virtually date from the years following the revolution of 1848. Thus the Comptoir National D'Escompte de Paris was founded in 1848, the Crédit Lyonnais in 1863, and the Société Générale in 1864. These and many other well-established institutions are deposit banks in the ordinary sense of the word, but cheques are in far less use to-day in France than in England, and the bulk of business transactions are settled by bills of exchange which are ultimately paid at the acceptor's house in currency. It is probably true to say that banking accounts are owned by far fewer people in France than in England, and a current examination of a French bank's balance-sheet shows that "bills discounted" outweighs "advances."

Many French banks are far more closely connected with industry than is considered prudent in England. There are a whole number of "banques d'affaires," whose prime purpose is to finance industrial undertakings, even at the sacrifice of that liquidity which should be a banker's chief aim.

Notwithstanding the Franco-Prussian war and the following crisis of 1873, French banking seems to have suffered less shocks in the 19th century than did English banking. The inflation during and after the World War appears not to have involved the banks in any serious difficulty, though it must have occasioned many moments of anxiety.

Germany.—Like French banking, German banking dates from the years succeeding the revolution of 1848. Thus of the four great "D" banks, so called from the initial letters of their names, the Deutsche Bank was founded in 1870, the Discontogesellschaft in 1851, the Dresdner Bank in 1872, and the Darmstadter und National Bank in 1853. The establishment of these banks was immediately prior to the union of Germany in 1870 and the era of German commercial prosperity and expansion. This probably accounts for the intimate relations between German banking and industry.

British and American banking practice is to grant loans to industry for temporary purposes, but to refrain from long-term financing or actual participation. Not that banking and trade are entirely divorced, for every British bank has several prominent industrialists upon its board. Yet liquidity is the guiding principle of banking in England.

The German principle is different. Before the World War, German banks habitually had a proportion of their funds invested permanently in definite industrial concerns, and the chief duty of many bank directors was to exercise control, on the part of the bank, over virtually "subsidiary" manufacturing companies,

and to seek out fresh channels in which the bank could employ its funds. This participation in industry had its good and its bad side. It brought a ready flow of capital into industry, but the banks sacrificed a good deal of their liquidity and so ran a greater risk of becoming insolvent.

Nevertheless, the practice worked, and even the war and the collapse of the mark did not destroy the leading German banks. This is not the place to give a detailed history of the inflation period, but one or two incidental results may properly be mentioned.

The inflation meant an enormous increase in the "paper" assets and liabilities of the banks, but a marked decrease in their "real" assets, measured in gold values. Dr. Schacht in his book *The Stabilization of the Mark* gives the following table, which incidentally shews the relative pre-war importance of ordinary banks, savings banks and co-operative banks, each of which played their definite part in the economic life of the country.

"REAL" ASSETS OF GERMAN BANKS, MEASURED IN GOLD

	1913.	1923 (end).
	Milliards of marks.	Milliards of marks.
Saving Banks.	19.7	0.1
Banks	13.4	2.7
Co-operative Banks	4.6	0.4
Insurance Institutions	6.3	1.2
Total	44.0	4.4

The fact that the German banks were active participants in industry possibly saved them severe loss, for part of their assets were represented by factories and commodities which preserved their "real" value at a time when Government and other securities fell in value to vanishing point. The above table bears out this suggestion.

The inflation also caused an enormous increase in the rapidity of circulation of a currency which nobody dared to keep. This meant far more work for the banks, and a consequent increase in staffs. So long as they were measured in paper marks, profits easily kept pace with expenses, but when stabilization came, and the nation was faced with "real" values, the banks like everyone else found that the country had been stripped of liquid cash and working capital. Staffs had to be cut down, expenses reduced, and most important of all, credits obtained from abroad to enable the banks to provide industry with liquid funds. Dr. Schacht's book gives an illuminating picture of the situation that then obtained.

The ratio between the old paper mark and the new gold mark was fixed at the astronomical figure of one billion to one. The banks recast their swollen balance-sheets in this proportion, and carried out all the superhuman readjustments of capital, expenses and so on, which the emergency demanded. Their extent is shewn in the following table, representing the Deutsche Bank, which is in itself sufficiently eloquent.

	1913.	1923.	1924.
	Mks. million (gold).	Mks. (paper).	Mks. million (gold).
Liabilities			
Paid-up Capital	200	1,500x10 ¹⁸	150
Reserve Fund	112	600x10 ¹⁸	50
Deposits	1,580	349x10 ¹⁸	864
Acceptances	301	550x10 ¹⁸	6
Miscellaneous	17	1x10 ¹⁸	2
Profits	36	..	19
Assets			
Cash	180	165x10 ¹⁸	294
Investments	161	3x10 ¹⁸	15
Shares in Allied Banks	136	2x10 ¹⁸	33
Bills Receivable	630	11x10 ¹⁸	220
Stock Exchange Loans	233
Loans and Advances	855	160x10 ¹⁸	473
Premises	31	..	46

As regards recovery since 1924, fair progress has been made, and thanks to temporary credits and long term loans from abroad, the stringency of credit is becoming abated. To quote but two examples, the banks' bill holding rose from 229 millions in 1924 to 406 in 1926, and loans from 473 millions to 1,098. As regards the further progress of German banking, this must be left to the future.

SAVINGS BANKS

These were first suggested by Daniel Defoe in 1697, but nearly a century was to elapse before they were actually established. The first was founded in Brunswick in 1765, and others rapidly followed upon the Continent. In 1799, following a suggestion of Jeremy Bentham, the Rev. Joseph Smith founded the first British Savings Bank at Wendover. The movement once started, spread in England as on the Continent and by 1817 had become sufficiently important to demand legislation.

The guiding principle laid down in the Acts of that year was that the local management of each bank should be in the hands of trustees who gave their services gratuitously, but that these should make periodical returns to the Government and also invest all the bank's funds in Government stock. Depositors were to receive interest at 3d per day or £4 11s. 3d. per annum. This was above the current yield on Government stock, and was designed to act as a bonus upon thrift. To minimize the losses to the Government, who had to bear the difference, and also to prevent abuse of the principle, a limit was placed to the total amount an individual could deposit. Even so, the Government rapidly found that they had shouldered a bigger burden than they could bear, and successive reductions were made in the rate of interest. Finally in 1888, the rate allowable to bank trustees was fixed at 3%, and that to depositors at 2½%, the margin representing the requirements of the trustees for management and other necessary expenses.

In 1863, which was possibly the hey-day of the independent savings bank, there were 622 of such institutions in existence. In that year, the Post Office entered the field, and inexorably encroached upon the domain of the private bank. By 1889 the number of banks had fallen to 380, and by 1905 to 224. The Post Office commanded a greater degree of public confidence, and provided more convenient facilities, while the decline of the private bank was hastened by such events as the break-up of the Cardiff Bank in 1886. The famous "penny banks," such as the Yorkshire Penny Bank and the National Penny Bank, held their own, but in general forces were at work to reduce the number of private banks.

Even as late as in the 'nineties, the customer of a joint-stock bank was expected to maintain a balance of some £200. By 1925, banking accounts were no longer the prerogative of the rich, but belonged to the middle-classes as well. By 1900, they may well be in universal use. In 1927 we find the "big five" prepared to receive sums as low as £1 on deposit; one such bank has supplemented this with a system of "home-saves."

From 1900, the private savings bank developed weakness within. By its rules, it was bound to invest its customers' funds in gilt-edged stock, mainly consols. When the pre-war slump in consols occurred, the defect of this rule appeared, and the fall in prices brought many savings banks face to face with difficulty, and in some cases led to enforced liquidation. Directors and trustees could not be blamed for what was only carrying out the rules, but this did not minimize the seriousness of the loss.

Finally, the war inflicted on all savings banks, including the Post Office, a new and formidable competitor. This was the War (afterwards National) Savings Certificates. Even at its present price of 16s per £1 certificate, it offers a yield greater than any savings bank can afford, while it is readily encashed, and in every way has a greater popular appeal than the Trustee savings bank. The latter's usefulness is far from extinct and in fact has made progress during post-war years, but it no longer has the field to itself.

A fuller account of the developments which have taken place in the savings bank movement since the World War is given in the article SAVINGS BANKS (qv). (N. E. C.)

UNITED STATES

Banking in most countries is conducted by a small number of large banks operating numerous branches, and failures are infrequent. In the United States, in striking contrast, banking is conducted (1928) by more than 26,000 banks; scores of new banks are opened every year and many failures have been an invariable incident of successive periods of business depression. In spite of evident drawbacks, this American system of independent unit banking, as it is commonly styled, has persisted, supported in general by public opinion and sheltered in most of the States by legislation which either narrowly restricts or entirely prohibits the establishment of branches. The functioning of this decentralized system of banking organization has given rise to many special problems, and it is with the handling of these problems that American banking history is in large measure concerned.

Throughout almost the entire course of the history of banking in the United States two conflicting tendencies or objectives are manifest. The maintenance of safety and the development of a smoothly working credit mechanism have been beset with difficulties, owing to the potent influence in the management of the bank of a desire to stimulate and further to the utmost the rapid exploitation of the country. In a purely local bank the wishes of borrowers are apt to overshadow the interests of the noteholder and the depositor, particularly in communities which are ambitious for rapid development.

First Bank of the United States.—For some two decades after the establishment of the first bank in the country, the Bank of North America, in 1782, the expansion of banking facilities was very gradual and the business seems to have been conducted along safe and conservative lines. Special charters by legislative enactment were required and were neither sought by numerous applicants nor freely granted, since, as during the entire colonial period, the economic development of the country was still proceeding slowly with little in the situation of affairs to stimulate enterprise and excite speculation. Sound banking practice was also furthered by the establishment in 1792 of the First Bank of the United States under a Federal charter. This nation-wide institution, with head office in Philadelphia and eight branches extending from Boston to New Orleans and serving the Government as its fiscal agent, was in a position to exert a predominating influence over other banks and the steady, conservative policies of its management contributed much toward the maintenance of proper credit restraint.

But, from about the beginning of the 19th century, the tempo of American economic life became more and more rapid. For quite a long period rich opportunities for the development of natural resources, manufactures and transportation furnished a demand for capital which exceeded the available supply, and any means that seemed to meet the deficiency found hearty support in wide circles, and, at times, throughout entire sections of the country. Among these substitutes for actual capital, bank-credit dispensed by a multiplicity of banks was freely and continuously employed. Special charters were granted more readily and in one State after another general laws were passed permitting the organization of banks under conditions that were commonly by no means of an exacting character.

Second Bank of the United States.—Between 1800 and 1811 the number of banks increased from 28 to 88 and the ill feeling excited by the steady pressure exerted upon them by the First Bank of the United States was largely responsible for the refusal of Congress to renew its charter in 1812. Four years later, however, a similar institution, the Second Bank of the United States, was established. This reversal of policy was a direct outcome of the inability of the purely local State banks to handle effectively the fiscal operations of the Government during the War of 1812. But, after twenty years of generally effective banking service, the Second Bank of the United States met the fate of its predecessor and for similar reasons. By 1836 the number of State banks had increased to 713 and their operations were restrained by the practice of presenting their notes for redemption, which was regularly followed by the Bank of the United States.

From 1837 until the establishment of the national banking system in 1863, banking in the United States was handled exclusively by banks organized under the laws of the various States, and the number of these institutions had increased to more than 1,600 at the time of the outbreak of the Civil War in 1861. Experience with the working of these banks disclosed three defects of major consequence—the presence of many weak and badly managed banks, excessive credit expansion during periods of business activity, and, finally, inability to cope with situations of severe financial strain manifested in the suspension of specie payments and the general dislocation of the credit mechanism.

Although the use of cheques was steadily becoming more general, bank-notes, which all banks were permitted to issue, were still the principal means of extending bank credit. When issued by hundreds of banks scattered over a wide territory, bank-notes lend themselves far more readily to unwise use than deposit credit, against which cheques are drawn, because the note is less certain than the cheque to be speedily presented for payment. The wide diffusion of losses among the scattered holders of the notes of failed banks and the impossibility of intelligently discriminating between the strong and the weak banks brought home to the public the importance of securing greater safety in banking. With this objective in view, one State after another developed elaborate banking codes covering virtually every banking activity and subjected the banks to Government supervision and examination. These codes included provisions relating to the amount and payment of capital, restrictions on loans, the maintenance of required reserves, and, above all, a wide diversity of arrangements designed to provide special security for the bank-note. In addition to the limitation of note issue to the capital of the several banks, the safeguard most generally adopted by the States was the requirement of the deposit of approved securities of sufficient value presumably to protect the outstanding notes of failed banks.

Banking Act of 1863.—The passage of the National Banking Act in 1863 made no fundamental change in the situation. The various provisions of this act were in some respects more exacting than those to be found in most, if not all, of the States, but they were of the same general character. The most certain gain was in the matter of currency. In 1865 a prohibitive tax of 10% was imposed upon the note issues of State banks and thereafter the country enjoyed in the note issue of the national banks a currency which possessed the advantages of uniformity and absolute safety, since each national bank was authorized to issue notes only to the amount of its capital, and these notes were secured by the depositing of U.S. Government bonds taken at 90% of par (after 1900, at par). But, like the issues which it superseded, the national bank-note lacked one desirable quality—elasticity. The amount outstanding tended to fluctuate with the price of Government bonds rather than in response to varying requirements of the community for currency.

The importance still attached to note issue and, even more, the high yield to be secured from Government bonds induced most of the State banks to become national banks soon after the system was established. But, within less than 20 years, the organization of banking institutions under State laws had become once more attractive. Government bonds advanced to high levels and the issue of notes became less essential with the spread of the cheque using habit. The requirements of State laws with regard to the minimum of capital, to loans (notably those secured by real estate) and as to required reserves, were less exacting and, finally, State laws permitted chartered institutions, known as trust companies, to undertake fiduciary functions of many kinds in addition to regular banking operations, a field of business that was not open to national banks. In 1870 there were but 325 State banks as against 1,612 in the national system, but, by 1924, the number of State banks and trust companies had increased to more than 19,000, and there were 8,085 national banks in operation. Within recent years, however, the relative attractiveness of Federal and State charters has approached more nearly to equality, partly through the strengthening of State laws, and in part through a general widening of the powers wielded by the national banks.

Banking legislation and Government supervision, both Federal and State, have not as yet succeeded in giving the depositor adequate protection. During the six-year period from 1922 to 1928, nearly 4,000 banks failed. Most of these failures were of small banks operating in communities in which there was little economic diversity and consequently scant opportunity for proper diversification in loans. Recent experience clearly indicates that charters are granted far too freely. All sections of the country could be adequately and more effectively served, with a decided gain in safety, by a much smaller number of banks.

Returning now to the period following the closing of the Second Bank of the United States in 1836, it is noteworthy that for more than 70 years thereafter all efforts to improve the banking system of the country were concentrated upon measures designed to strengthen the individual bank. But, even had these efforts been more completely successful in maintaining all banks in a solvent condition, that alone would not have provided the country with a satisfactory banking system. There is at all times a close interrelation between banks through the huge mass of cheques and other items in process of collection. If regular settlements between banks are delayed, or the possibility of their continuance is questioned, the machinery for making payments instantly becomes dislocated and trade is seriously obstructed. Again, the payment of bank loans at any time depends in large measure upon the ability to secure anticipated accommodation from banks by those who are indebted in the ordinary course of business to present borrowers. In the United States, as elsewhere, repeated experience has clearly shown that in the absence of some co-ordinating agency banks in periods of financial strain are prone to adopt policies which are almost certain to bring about the dislocation of the payment machinery, and also affect unfavourably the ability of borrowers to liquidate their loans. Such was American experience in 1837 and in 1857 before, and in 1873, 1893 and 1907 after the establishment of the national banking system. In each instance the resources of all of the banks were fully employed before the outbreak of the crisis and each bank endeavoured to strengthen itself by an immediate reduction of loans and the hushandling of its reserve of cash. Limited co-operative arrangements were indeed employed during each crisis after that of 1857, but these arrangements did not extend beyond the groups of banks associated in the clearing house of particular cities. In all of these instances, payments between banks in different sections of the country were interrupted and the business community was subjected to unnecessary loss as a consequence of the frantic and largely unavailing efforts of the banks to contract loans in wholesale fashion. Each crisis became more explosive and unmanageable than its predecessor because each crisis further confirmed the expectation throughout the community that the bank machinery would collapse when subjected to severe strain.

Federal Reserve Banks.—The need for radical change in the banking organization of the country that was disclosed in successive crises was not clearly recognized until after the crisis of 1907. The attention of bankers as well as of the public had previously been absorbed by the more urgent needs for monetary reform—after 1873 the resumption of specie payments, and after 1893 the repeal of the Silver Purchase law (secured at once)—and the establishment of the gold standard upon a firm basis which was finally accomplished with the passage of the Currency Act of 1900. Difficulties due to monetary causes were, however, entirely absent in the case of the crisis of 1907 and, consequently, the unsatisfactory state of the banking machinery and practice of the country now first became clearly evident. Experience elsewhere clearly indicated that a central banking organization, if not the sole, was at least the remedy most certain to prove effective. Many other countries had already developed an effective agency of banking co-ordination in single banks commonly known as central banks. In the United States the proposal to follow the existing practice was urged, but finally a modified form of decentralized organization was adopted under which 12 Federal Reserve banks, virtually central banks, were established, each operated by its own officers but subject to general supervision by the Federal Reserve board in Washington. The improvement in

banking machinery stood on the slope, powerless to take part in the Reserve system on the crest. The advance of the third English elsewhere, accept of the worse, and the sole attempt to deploy the standard and for the with great slaughter by the charge of Keith's chinery of the country threw his infantry reserve into the battle. Reserve banks have been the English archers wounded the men authorized to issue bank-note and the remnants of the leading line an instrument of credit. When the final impetus to their rout the Reserve banks do not end of the "gillies," some thousands sources at all times. On the suddenly emerged from the woods, power in leash for use in emergency as they possessed, and hold longer danger that there will be resort to "Slay, slay!" seemed contraction. Again, the danger of any advance of a great reserve, settlement between banks is removed. The army broke and fled in on the books of the Reserve banks where a little burn, and the de-commercial banks maintain balances, and a country until they re-the Reserve banks removes the temptation for debts and bannerets, on the part of any solvent banking institution. They were killed in bannerets and

In the Reserve system the United States possesses a central loss of which performs more comprehensive functions and assumes definite responsibilities than those that were recognized in the First or the Second Bank of the United States. In fact they reflect the development in central banking practice in European countries during the intervening years and it may reasonably be presumed that if the Second Bank of the United States had been continued it would not have failed to keep pace with that development.

In the light of subsequent experience it is clear that the failure of Congress to renew the charter of the Second Bank of the United States was most regrettable and it is important to observe that the unfortunate consequences which may be attributed to the absence of any co-ordinating banking agency were not confined to the narrow field of banking operations. In particular, it is altogether probable that many of the purely monetary difficulties which the country has experienced would have been escaped. Upon the closing of the Bank of the United States, the Federal Government set up the so-called independent Treasury system, handling its own receipts and payments without utilizing banking facilities and, indeed, refusing to receive the notes issued by the State banks, insisting that payment be made in specie. Under this system the Government withdrew money from use whenever its receipts for any reason exceeded its current expenditures. During years of peace the operations of the independent Treasury were a matter of minor consequence, but serious difficulties were immediately experienced upon the outbreak of the Civil War. The banks of the country patriotically made liberal advances to the Government which felt compelled at once to withdraw the funds from the subscribing banks. A monetary crisis was inevitable. Specie payments were suspended and soon thereafter the Government resorted to successive issues of inconvertible and depreciated paper money. It is by no means improbable that the Civil War could have been financed on a gold basis if the Second Bank of the United States had then been in operation. It was impossible to do so without that co-ordinating agency.

BANKS, SAVINGS: see SAVINGS BANKS.

BANKSIA, an Australian genus of shrubs and trees (family Proteaceae), with leathery leaves, often deeply cut, and handsome spikes of flowers. It is named after Sir Joseph Banks (*q.v.*). The plants are grown in England for their handsome foliage as evergreen greenhouse shrubs.

BANKS OF ISSUE. In the modern world the principle of centralization of the note issue has gained ground so widely that it is now almost the exception to find more than a single bank of issue in a given country: the bank of issue in that case being the central bank, which requires control over the paper currency as a necessary part of its task of supervising credit conditions.

In continental Europe the general rule is that the note issue is monopolized by the central bank. This is the case in France, Belgium, Holland, Scandinavia, Italy, the Succession States, Spain and Portugal. In Germany the note issue is divided between the Reichsbank and the banks of Baden, Saxony and Württemberg, the major part of the issue belonging to the Reichsbank. In Poland the stabilization plan of 1927 proposes to centralize all note issues in the hands of the Bank of Poland.

In North America, the "Chartered Banks" of Canada still retain the right of note issue: in the U.S.A., in addition to the notes of the Federal Reserve Board, the national banks are allowed to issue notes based upon holdings of government securities. In Canada there is no central bank at all, but the Government also issues notes. There is no bank of issue in India; in Australia the note issue is now in the hands of the Commonwealth Bank, and in South Africa in the hands of the South African Reserve Bank. In South America, *i.e.*, in Chile, Colombia, Brazil, Uruguay, Bolivia and Peru there is a local monopoly of issue in the hands of a central bank, the general model followed being, in the main, the Federal Reserve Bank. In Venezuela note issue is still in the hands of six individual banks. In the Argentine the notes are issued by the "Caja de Conversion." In the Far East, apart from government paper currency, the Bank of Japan has a monopoly of issue, and the Bank of Java in the Dutch East Indies. Complete confusion as to note issues obtains in China.

In the United Kingdom the position varies as between England and Wales, Scotland and Ireland. In *England and Wales*, only the Bank of England now issues notes: Fox, Fowler and Co., the last private bank of issue, having relinquished their rights under the Bank Act of 1844 on amalgamating with Lloyds Bank. In *Scotland*, under the Bank Act of 1845, there are eight remaining banks of issue, with the following authorized circulation:—Bank of Scotland, £396,852; Royal Bank of Scotland, £216,451; British Linen Bank, £438,024; Commercial Bank of Scotland, £374,880; National Bank, £297,024; Union Bank, £454,346; Clydesdale Bank, £274,321; North of Scotland Bank, £224,452. Any notes in excess must be covered by gold or other legal tender; at the present time the average circulation is in the neighbourhood of £20,000,000. In *Ireland* there are, under the terms of the same act, six banks of issue: The Bank of Ireland, £3,938,000; the Provincial Bank, £927,000; the Belfast Banking Company, £281,000; Northern Banking Company, £243,000; the Ulster Bank, £311,000; the National Bank £853,000. The total circulation (including covered excess) is in the neighbourhood of £15,000,000. (See also BANK OF ENGLAND, BANK CHARTER ACT and MONEY.)

BANKURA, a town and district of British India, within the Burdwan division of Bengal. Pop. (1921) 25,412. The district has an area of 2,625 sq.m., and in 1921 its population was 1,019,941. Bankura forms a connecting link between the delta of the Ganges on the east and the plateau of Chota Nagpur on the west. Two hills, Susinia and Biharinath, which are outliers of the plateau, rise to a height of 1,442 and 1,469 ft. above sea-level. Along its eastern boundary adjoining Burdwan district the country is flat and alluvial. To the west, however, the surface gradually rises into long undulating tracts; rice lands and swamps give way to jungle or forest trees. The Raniganj coal field extends to a narrow strip along the river Damodar, and coal is worked

in a few mines. Laterite, which is used for road metalling and railway ballast, is quarried extensively. Shell-lac is produced and silk and tussur are woven. A branch of the Bengal-Nagpur railway passes through the district, and a light railway, the Bankura-Damodar river railway, runs from Bankura town through Indas to Rainagar. The district is exposed to drought and also to destructive floods. It suffered in the famines of 1866, 1874-75 and 1896-97, and famine had again to be declared in 1915-16. The subdivisional town of Vishnupur (pop. 19,398) was formerly the capital of a small principality under the Rajas of Vishnupur. The temples in the town, which are memorials of their power and piety, represent the most complete set of specimens of the Bengali style of temple architecture.

BANN, the largest river in Northern Ireland. Rising in the Mourne mountains in the south of Co. Down it runs north-west to Lough Neagh (*q.v.*), which it drains north-north-west to an estuary at Coleraine, forming Lough Beg immediately below the larger lough. The length of its valley is about 90 miles. The total drainage area of the system is about 2,300 sq.m., extending westward to Co. Fermanagh, and including parts of the Cos. Down and Antrim, Armagh and Monaghan, Tyrone and Londonderry. The river has valuable salmon fisheries. Above Lough Neagh it is known as the Upper Bann and below as the Lower Bann.

BANNATYNE, GEORGE (1545-?1608), collector of Scottish poems, was a native of Newtyle, Forfarshire. He became an Edinburgh merchant and was admitted a burgess in 1587. Some years earlier, in 1568, when the "pest" raged in the capital, he retired to his native county and amused himself by writing out copies of poems by 15th and early 16th century Scots poets. His work extended to 800 folio pages, divided into five parts. The ms. descended to his only daughter Janet, and later to her husband's family, the Foulises of Woodhall and Ravelston, near Edinburgh. From them it passed to the Advocates' Library (National Library of Scotland). This ms., known as the "Bannatyne Manuscript," constitutes with the "Asloan" and "Maitland Folio" mss. the chief repository of Middle Scots poetry, especially for the texts of the greater poets Henryson, Dunbar, Lyndsay, and Alexander Scott. Portions of it were reprinted (with modifications) by Allan Ramsay in his *Ever Green* (1724), and later, and more correctly, by Lord Hailes in his *Ancient Scottish Poems* (1770). The entire text was issued by the Hunterian club (1873-1902). The name of Bannatyne is perpetuated in the Bannatyne club (founded 1823), devoted to the publication of historical and literary material from Scottish sources.

See the 33rd publication of the club (1829), *Memorials of George Bannatyne* (1545-1608), with a memoir by Sir Walter Scott and an account of the ms. by David Laing; also Gregory Smith, *Specimens of Middle Scots* (1902).

BANNERET, a noble with the right to lead his vassals under his own banner. Ultimately bannerets obtained a place between barons and knights bachelor, which has given rise to the idea that they are the origin of King James I.'s order of baronets. Selden, indeed, points out that "the old stories" often have *baronetti* for *bannereti*, but he is careful to say that banneret "hath no relation to this later title." The title of knight banneret, with the right to display the private banner, came to be granted for distinguished service in the field.

"No knight banneret," says Selden, of the English custom, "can be created but in the field, and that, when either the king is present, or at least his royal standard is displayed. But the creation is almost the self-same with that in the old French ceremonies by the solemn delivery of a banner charged with the arms of him that is to be created, and the cutting of the end of the pennon or streamer to make it a square or into the shape of a banner in case that he which is to be created had in the field his arms on a streamer before the creation." The creation of bannerets is traceable, according to Selden, to the time of Edward I.

BIBLIOGRAPHY.—See Selden, *Titles of Honour* (3rd ed., London, 1672), p. 656; Du Cange, *Glossarium* (Niort, 1883), s.v. "Bannereti."

BANNERS, FEAST OF, a Japanese festival in honour of male children, held on May 5 (Jap. *Nobori-no-Sekku*). Every householder who has sons fastens a bamboo pole over his door

and hangs from it gaily-coloured paper fishes, one for each of his boys. These fishes are made to represent carp, which are in Japanese folklore symbolical of health and longevity. The day is recognized as a national holiday.

BANNISTER, CHARLES (1738–1804), English actor and singer, was born in Gloucestershire, England, made his first London appearance in 1762 as Will in *The Orators* at the Haymarket. Bannister was a singer as well as an actor, and Garrick engaged him for Drury Lane. He died Oct. 26 1804.

His son **JOHN BANNISTER** (1760–1836), born at Deptford on May 12 1760, first studied painting, but soon took to the stage. His first formal appearance was at the Haymarket in 1778 as Dick in *The Apprentice*. The same year at Drury Lane he played in James Miller's version of Voltaire's *Mahomet* the part of Zaphna. Bannister was the best low comedian of his day. As manager of Drury Lane (1802) he was no less successful. He retired in 1815 and died on Nov. 7 1836. Gainsborough, Morland, and Rowlandson were among his friends.

See Adolphus's *Memoirs of John Bannister* (1838).

BANNOCKBURN, a town of Stirlingshire, Scotland. Population (1921) 4,090. It is situated on the "burn" from which its name is derived, the Bannock (Gaelic, *ban oc*, "white, shining stream"), an affluent of the Forth. The town lies 2½ m. S.S.E. of Stirling by the L.M.S. railway, and now has woollen manufactures (chiefly tweeds, carpets and tartans) though at the beginning of the 19th century it was only a village. The Bore Stone, in which Bruce planted his standard before the battle in which he defeated Edward II. in 1314 (see below) is preserved by an iron grating. A mile to the west is the Gillies' hill, now finely wooded, over which the Scots' camp-followers appeared to complete the discomfiture of the English, to which event it owes its name. Bannockburn house was Prince Charles Edward's headquarters in Jan. 1746 before the fight of Falkirk.

The famous battle of Bannockburn (June 24, 1314) was fought for the relief of Stirling castle, the principal strategic key to Scotland, which was besieged by the Scottish forces under Robert Bruce. The English governor of Stirling had promised that, if he were not relieved by that date, he would surrender the castle, and Edward II. hastily collected an army in the northern and midland counties of England. Bruce made no attempt to defend the border, and selected his defensive position on the Bannock Burn, 2½ m. S. of Stirling. His front was covered by the marshy bed of the stream, his left flank by its northerly bend towards the Forth, his right by a group of woods, behind which, until the English army appeared, the Scots concealed themselves. On the 23rd the van of Edward's army which heavily outnumbered the Scots (perhaps 25,000 to 15,000), appeared to the south of the burn and at once despatched two bodies of men towards Stirling, the first by the direct road, the other over the lower Bannock Burn near its junction with the Forth. The former was met by the Scottish outpost on the road, and here occurred the famous single combat in which Robert Bruce, though not fully armed for battle, killed Sir Henry Bohun. The English detachment which took the other route was met and after a severe struggle defeated by a body of Scottish pikemen near St. Ninian's. It would seem probable that the main passage of the English army took place at a point between these two crossings. Early on St. John's day the Scottish army took up its assigned positions. Three corps of pikemen in solid masses formed the first line and Bruce had with him in reserve a 4th corps of pikemen and a squadron of 500 chosen men-at-arms, kept mounted, under Sir Robert Keith, the marischal of Scotland. Edward's cavalry were formed in nine or ten "battles," arranged in three lines, with the unwieldy masses of foot behind. Ignoring the lesson of Falkirk (*q.v.*), the mounted men rode through the morass and up the slope, and it would seem that the attack was precipitated before the English dispositions were complete. It failed to make any gap in the line of defence, and the battle became a *mêlée*, the Scots, with better fortune than at Falkirk and later at Flodden (*q.v.*), presenting always an impenetrable hedge of spears, the English, too stubborn to draw off, constantly trying in vain to break it down. So great was the press that the "battles" of the second line which followed the first were unable

to reach the front and stood on the slope, powerless to take part in the struggle on the crest. The advance of the third English line only made matters worse, and the sole attempt to deploy the archers was crushed with great slaughter by the charge of Keith's mounted men. Bruce threw his infantry reserve into the battle on a flank, the arrows of the English archers wounded the men-at-arms of their own side, and the remnants of the leading line were tired and disheartened when the final impetus to their rout was given by the historic charge of the "gillies," some thousands of Scottish camp-followers who suddenly emerged from the woods, blowing horns, waving such weapons as they possessed, and holding aloft improvised banners. Their cries of "Slay, slay!" seemed to the wearied English to betoken the advance of a great reserve, and in a few minutes the whole English army broke and fled in disorder down the slope. Many perished in the burn, and the demoralized fugitives were hunted by the peasantry until they re-crossed the English border. One earl, 42 barons and bannerets, 200 knights, 700 esquires and probably 10,000 foot were killed in the battle and the pursuit. One earl, 22 barons and bannerets and 68 knights fell into the hands of the victors, whose total loss of 4,000 men included, it is said, only two knights. The fundamental lesson of the battle (that of the folly of launching a mounted attack against unbroken pikemen) was turned to account at Dupplin (1332) and Halidon Hill (1333), and led in turn to the repeated victories of the Hundred Years' War (*q.v.*), wherein the English archers disorganized the enemy before any decisive stroke was attempted.

See Barbour, *Bruce* (W. M. Mackenzie's ed., 1909); J. E. Shearer, *Fact and Fiction in the Story of Bannockburn* (1909); Oman, *History of the Art of War in the Middle Ages* (1924), vol. ii., 24–100.

BANNS OF MARRIAGE, the public legal notice of an impending marriage. The church in earliest days was forewarned of marriages (Tertullian, *Ad Uxorem, De Pudicitia*, c 4). The first canonical enactment on the subject in the English Church is that contained in the 11th canon of the synod of Westminster in London (A.D. 1200), which orders that "no marriage shall be contracted without banns thrice published in the church, unless by special authority of the bishop." It is, however, believed that the practice was in France as old as the 9th century, and certainly Odo, bishop of Paris, ordered it in 1176. By the Lateran Council of 1215 the publication of banns was made compulsory on all Christendom. In early times it was usual for the priest to betroth the pair formally in the name of the Blessed Trinity; and sometimes the banns were published at vespers, sometimes during mass. In Great Britain, under the canon law and by statute, banns are the normal preliminary to marriage; but a marriage may also be solemnized without the publication of banns, by obtaining a licence or a registrar's certificate. In the United States there is no statutory requirement; and the practice of banns (though general in the colonial period) is practically confined to the Roman Catholics. (See *BETROTHAL* and *MARRIAGE*.)

BANNU, a town and district of British India, in the Derajat division of the North-west Frontier Province. The town (also called Edwardesabad and Dhulipnagar) lies in the north-west corner of the district, in the valley of the Kurram river. Pop. (1901) 14,300; (1921) 29,737.

The district of Bannu, which consists only of the Bannu and Marwat tahsils since the constitution of the North-West Frontier Province in 1901, contains an area of 1,680 sq. m., lying north of the Indus. The cis-Indus portions of Bannu and Dera Ismail Khan now comprise the Punjab district of Mianwali. In addition to the Indus the other streams flowing through the district are the Kurram (which falls into the Indus) and its tributary, the Gambila. The valley of Bannu proper, stretching to the foot of the frontier hills, forms an irregular oval, measuring 60 m. from north to south and about 40 m. from east to west. In 1921 the population was 246,734, the great majority Mohammedans. The principal tribes inhabiting the district are: (1) Waziri Pathans, recent immigrants from the hills, for the most part peaceable and good cultivators; (2) Marwats, a Pathan race, inhabiting the lower and more sandy portions of the Bannu valley; (3) Bannuchis, a mongrel Afghan tribe of bad physique. After the

annexation of the Punjab the valley was administered by Herbert Edwardes so thoroughly that it became a source of strength instead of weakness during the mutiny, but it is always subject to incursion from the Waziri tribes in the Tochi valley and the neighbouring hills. Salt is quarried on Government account at Kalabagh and alum is largely obtained in the same neighbourhood. The chief export is wheat. A military motor road leads from Bannu town towards Dera Ismail Khan, and another up the Tochi valley and up to the new cantonment of Razmak in Waziristan. The Indus, which is nowhere bridged within the district, is navigable for native boats throughout its course of 76m. The chief frontier tribes on the border are the Waziris, Battannis and Dawaris (*see* these names). A 2ft. 6in. railway runs from Kalabagh to Bannu, with a branch through the Pezu pass to Tank.

BANQUE DE FRANCE. The Banque de France owes its origin to Napoleon. It was founded on Feb. 13, 1800. It was based upon abortive negotiations to the same end which took place four years before, and was designed "to counteract the displacement and dispersion of the funds serving to feed the trade of the nation, and all such influences as tended to impair the public credit and to clog the circulation of wealth in the country, influences arising from the French Revolution and from lengthy and expensive wars." In accordance with usual central banking practice, the Banque de France does not belong to the State but to private shareholders. It had a capital of 30 million francs on its foundation, and this was raised by degrees to 182½ millions, which has been the capital of the Bank since 1857. The control of the Bank is vested in 15 *régeants* and three *censeurs*, who are elected by the shareholders, and in the Governor and two Deputy Governors who are appointed by the State. These 21 officials form the General Council of the Bank. The Governor and Deputy Governors are the normal executive officers of the Council and have full powers.

History and Policy, 1800-1914.—The history of the Banque de France from 1800 until 1914 was far less eventful than that of the Bank of England. It gained through being founded late enough for the principles of banking and currency to have reached a fairly advanced stage in their evolution, and so escaped most of the birth-pangs of the Bank of England. France, too, had more of the saving spirit and less of the speculative spirit than had England, and so the Bank was less exposed to recurrent crises arising from over-trading.

The Banque de France was not originally intended to be a central bank in the modern sense of the word nor to confine its operations to Paris. It opened three country branches in 1800, and though these were closed in 1817, further branches were opened again in 1835, while in 1848 nine country banks were absorbed and turned into branches. This policy of extending its activities into the country has been continued, and in 1927, besides its head office, the Bank possessed four Paris branches, 139 provincial branches and 94 auxiliary offices. Furthermore, it undertakes collections of bills in 350 other towns, known as "*villes attachées*," with the result that it operates in 602 centres outside Paris.

Note Issue.—Nor did it originally possess a universal privilege of note issue. Originally its privilege only ran in those centres where it possessed branches, and it was only in 1848 that it was extended to cover the whole country. This right has been renewed from time to time, and at present is due to expire in 1945.

The note issue in pre-war days was normally convertible. The Bank is not bound to carry any fixed proportion of metallic cover, but is forbidden to issue notes beyond a fixed upper limit (in 1914, 6,800 million francs). On only three occasions has convertibility been suspended. The first was during the revolution of 1848, the second in the Franco-Prussian war of 1870, and the third in 1914.

These should be contrasted with the four suspensions of the Bank Act in England (*see* BANK OF ENGLAND, AND BANKS, HISTORY OF). The British crisis of 1847 coincided approximately with the French suspension of 1848. During the world-wide crisis of 1857, the Banque de France lost 25 million francs in gold to the United States, but for all that preserved convertibility. The

British crisis of 1866 left France unscathed, and indeed drove French money out of London back to France. In the minor British crises of 1838 and 1890, the Banque de France was able to come to the rescue of London.

Banking Functions.—The purely banking functions of the Banque de France are in some respects comparable with those of the Bank of England. Three important differences must be remembered. The first is that the Banque de France does not act mainly as a "bankers' bank." The second is that the Paris money market is far less highly developed and so of far less international importance than is that of London. The third is that the cheque is in far less general use in France than in England. The Bank exercises control through the manipulation of its rate of discount (the upper limit of 6% to this rate was removed by the law of 1857), and by "open market" operations. It will only discount "three name" paper with three months or less to run and representing genuine commercial transactions, though in certain cases approved collateral (in merchandise or securities) can be substituted for the third name. It not only rediscounts for other banks but for the general public.

It may lend against Government, corporation or colonial stocks, Crédit Foncier obligations, and railway stocks and debentures. For the rest, it conducts an "ordinary banking business," acts as the banker of the French Government, and is responsible for all work in connection with the issue and service of State loans.

History Since 1914.—The war and the depreciation of the franc are a history in themselves. In 1914, the Bank had to take over 4,500 millions of commercial bills, and put them "into cold storage," as was done by the Bank of England in London. To protect the gold reserves, the convertibility of the note issue was suspended. Subsequently the Bank was called upon to make temporary advances to the State. These were drawn upon as granted and the proceeds paid, mainly in notes, to creditors of the Government. This caused an expansion in the note issue and the limit of 6,800 millions had to be raised.

In 1920, when it was possible to take stock, advances by the Bank to the State stood at 27,000 million francs, and notes in circulation at 37,600 millions. To rectify this position, the State agreed to repay 2,000 millions per annum. For a few years this programme was successfully carried into effect, and by the beginning of 1923 the debt had been reduced to 23,300 millions. Unfortunately, the note circulation failed to contract, and at that date still stood at 37,400 millions. Also by then the national finances had broken down, and during 1923 only 200 millions was repaid to the Banque, while the note circulation rose to 39,100 millions or perilously near the then legal limit of 41,000 millions.

Little or no improvement was recorded in 1924, and in April, 1925, matters reached a crisis. The Governor of the Bank had to announce that the legal limits of 22,000 millions to State advances and 41,000 millions to the note issue had been exceeded. This caused the immediate downfall of the Government of the day, while to regularize the position of the Bank, the limits were extended to 38,500 and 58,500 millions.

The next stage in the post-war history of the Banque de France was the recommendations of the Currency Commission in the summer of 1926, followed by the entrance into power of a stable Government, and franc "stabilisation in fact." The Commission recommended *inter alia* that "The Banque de France must be in a position to remit fresh demands from the Government for loans, which would form the basis for fresh issues of paper money." After the adoption of this and other recommendations, the Bank was able to put its house in order. This was proved by its action in April, 1927, in repaying its war debt of £33,000,000 to the Bank of England, thereby recovering £18,000,000 in gold which had been lodged in London as collateral.

The recovery of the franc gave the Banque de France the command over large balances in foreign currencies. To reduce these to manageable proportions, in the summer of 1927 it began to buy gold in London, and rapidly upset the London money market. This contributed to a result whose future importance it was then impossible to gauge. In July of that year, an informal conference was held in the United States between the Governors

of the Banque de France, Reichsbank, Bank of England and Reserve Bank of New York, directed towards closer co-operation between the central banks of the world. (N. E. C.)

BANQUETTE, in military language, the place upon which men stand to fire over a parapet.

BANSDA, a native State in the south Gujarat division of Bombay, India, belonging to the Surat agency. Area, 215 sq. m. Pop. (1921) 40,125. Its chief is a rajput. About half the total area of the State is cultivable, but the bulk is forested.

BANSHEE, a supernatural being in Irish and general Celtic folklore, whose mournful screaming at night is held to foretell the death of some member of the household visited (Ir. *bean sídhe*; Gael. *ban sìth*, "woman of the fairies"). The Irish banshee is held to be the distinction only of families of pure descent. The Welsh banshee is the *gwrach y Rhibyn* (witch of Rhibyn). Sir Walter Scott mentions belief in the banshee in the highlands of Scotland (*Demonology and Witchcraft*, p. 351).

See W. Wirt Sikes, *British Goblins* (1880).

BANSWARA, a State in Rajputana, India. It borders on Gujarat and has an area of 1,606 sq. m. The population in 1921 was 190,362. The Mahi is the only river in the State and great scarcity of water occurs in the dry season. The Banswara chief is a Sisodhyaia rajput of the Dungarpur family. During the decline of the Delhi empire Banswara passed under the Mahrattas. Wearing out by their oppressions, its chief in 1812 petitioned for English protection. By a treaty of 1818 the British guaranteed the prince against external enemies and refractory chiefs; he, on his part, pledging himself to be guided by a British representative. The chief has the title of Maharawal and a salute of 15 guns. The chief town is Banswara, situated about 8 m. W. of the Mahi river, surrounded by an old disused rampart and adorned by various Hindu temples, with the battlements of the chief's palace overlooking it. Its population in 1921 was 8,588. The petty State of Kushalgarh is feudatory to Banswara.

BANTAM, the westernmost residency of Java, Dutch East Indies, bounded east by the residencies of Batavia, Buitenzorg, and West Preanger, west by the Strait of Sunda, north by the Java sea and south by the Indian ocean. The area is 79,130 sq. km. It includes Princes Island, and several smaller islands off the west and south coasts. The population in 1905 was 909,489, of whom 469 were Europeans and Eurasians and 5,661 foreign Asiatics (including Chinese). In 1926 the population was 918,497. The natives are Sundanese, except in the northern division (Serang), where they are Javanese. The northern part is fertile and flat, except for a hilly group in the centre, where there are two inactive volcanoes, Karang and Pulosari; on a ridge of the former is the crater-lake Dano. In the south the Kendang mountains extend into Preanger, whilst the extreme south-west is very hilly and thickly wooded. The coast is mostly low-lying and, in parts, swampy, but the hills extend to near the coast in the south. Rice and rubber are the chief crops, and coconuts, coffee, coca (cocaine), pepper, sugar-cane and the usual tropical fruits are grown. The rivers of Bantam are navigable only at their mouths, but the residency is well provided with roads and is connected with Batavia by rail. The line divides at Chilegon, one branch going north to Anjer and the other to Merak, where it connects with steamers to Teluk Betong, in Sumatra. Another line runs southwards to the coast, at Labuan. Bantam contains five native regencies—Serang, Anjer, Pandelang, Charingin and Lebak. The principal towns are: Serang, the capital (pop. 21,656), Chilegon, Pandelang, Menes and Rangkas Betung (a rubber centre). Serang is 2½ m. from Bantam bay, where its port, Karangantu, is situated. Close to Serang is the ruined town of Bantam, once the capital of the kingdom of Bantam. The ruins include the remains of the former pepper warehouses, the old factory and Fort Speelwijk, of the Dutch East India Company, whose settlement at Bantam was their principal one in Java, in the days before the foundation of Batavia; also a well-preserved mosque, supposed to have been built by the third Mohammedan ruler of Bantam (1572–76), a former palace of the Sultans of Bantam and some of their tombs.

Bantam was a powerful Mohammedan State, whose sovereign

extended his conquests in Borneo and Sumatra. In 1596 the Dutch arrived at Bantam, expelled the Portuguese and set up an establishment. A British factory, established in 1603, which was for some years the chief settlement of the East India Company in the East Indies, continued to exist until 1682, when the staff was expelled by the Dutch. In 1683, the Dutch, who had reduced the Sultan of Bantam to a state of vassalage, built Fort Speelwijk, at Bantam, and monopolized the port, which had been free; for more than a century Bantam was an important seat of Dutch East Indian commerce. In 1811, after Batavia had surrendered to the British, Bantam followed suit. In 1814 it was restored to the Dutch, who removed the capital to Serang. Revolts occurred in Bantam during the British rule in Java, and at intervals from 1822 to 1850 there were outbreaks against the Dutch. In 1872 a priest from Mecca formed a religious association, the members of which, in 1883, ravaged the whole province, destroyed 51 villages and ruined many others; as recently as 1927 Bantam was the scene of organized Communistic revolt against Dutch rule. Bantam suffered very severely as a result of the Krakatoa eruption in 1883; it has also had disastrous outbreaks of fever and cattle plague. (E. E. L.)

BANTIN or **BANTING**, the wild ox of Java, *Bibos sondaicus*. The white patch on the rump distinguishes the bantin from its ally the gaur (*q v*). Adult bulls of the bantin are completely black except for the white rump and legs, but the cows and young are rufous. In Burma the species is represented by the tsaine, in which the bulls are rufous fawn. (See BOVIDAE.)

BANTING, FREDERICK GRANT (1801–), Canadian scientist, was born in Canada and educated at the University of Toronto. He served in the World War and then practised medicine in London, Ontario, until May 1921, when he commenced research at the University of Toronto on the internal secretion of the pancreas. In 1922 it was announced that he, with Prof. Macleod and others, had succeeded in preparing insulin, a specific cure for diabetes. He was appointed professor of medical research at the University of Toronto in 1923 and, together with Prof. Macleod, received the Nobel Prize for medicine in the same year. In 1923 the Canadian parliament voted an annuity of £1,500 to enable Banting to carry on his investigations, and, in the following year, a Banting Research Foundation was established to commemorate the achievements of Banting and his co-workers. (See INSULIN; THERAPEUTICS.)

BANTING SYSTEM, a diet for obesity (*q v*).

BANTOCK, GRANVILLE (1868–), English composer, born in London on Aug. 7, 1868; studied at Trinity College of Music and the Royal Academy of Music, London. From 1893–96 he edited the *New Quarterly Musical Review* and toured the country as conductor of musical comedy and light music. At the same time, and throughout the succeeding years, he associated himself actively with the more advanced school of musical thought, and attracted attention by the individuality and freedom from conventionality of his own earlier compositions. In the autumn of 1900 he became principal of the school of music attached to the Birmingham and Midland Institute, and later professor of music at the University of Birmingham, and in both positions he found further opportunities for proclaiming his ideals and advancing their acceptance. Of his own works composed during this period the most important was his picturesque and elaborate setting for solo voices, chorus and orchestra of Fitzgerald's *Omar Khayyam*, which immediately took its place among the most notable achievements of its time. How great are Bantock's powers as an orchestral colourist is made sufficiently plain in such works as *Omar Khayyam*, the Hebridean Symphony and *The Great God Pan*, while not less striking have been some of his experiments in the evolution of a new choral technique in such works as his *Atalanta in Calydon* and *Vanity of Vanities*. In connection with the latter and his other choral compositions it may be noted that Bantock has always been an enthusiastic supporter and apostle of the competition festival movement.

BANTRY, town, Co. Cork, Ireland, 58 m. S.W. of Cork by the Great Southern railway. Pop. (1926), 2,681. It is a centre for sea fisheries. It is the terminus of the railway, and was a

coaching station on the famous "Prince of Wales" route (named after King Edward VII.) from Cork to Glengarriff and Killarney. The bay, with excellent anchorage, is a picturesque inlet some 22m. long by 3 to 6m. broad with several islands. It was the scene of attempts by the French to invade Ireland in 1689 and 1796, and troops of William of Orange were landed here in 1697. Ruins of the so-called "fish palaces" testify to the failure of the pilchard fishery in the 18th century.

BANTU LANGUAGES. The greater part of Africa south of the equator possesses but one linguistic family so far as its native inhabitants are concerned. This clearly-marked division of human speech has been entitled the Bantu, a name invented by Dr. W. H. I. Bleek, and it is, on the whole, the fittest general term with which to designate the most remarkable group of African languages. *Bantu* (literally *Ba-ntu*) is the most archaic and most widely spread term for "men," "mankind," "people," in these languages. It also indicates aptly the leading feature of this group of tongues, which is the governing of the unchangeable root by prefixes. The syllable *-ntu* is nowhere found now standing alone, but it originally meant "object," or possibly "person." It is also occasionally used as a relative pronoun—"that," "that which," "he who." Combined with different prefixes it has different meanings. Thus (in the purer forms of Bantu languages) *muntu* means "a man," *bantu* means "men," *kintu* means "a thing," *bintu* "things," *kantu* means "a little thing," *tuntu* "little things," and so on. This term *Bantu* has been often criticized, but no one has supplied a better, simpler designation for this section of Negro languages, and the name has now been definitely consecrated by usage.

Though there is a certain physical resemblance among those tribes who speak clearly-marked Bantu dialects (the Babangi of the upper Congo, the people of the Great Lakes, the Ova-herero, the Ba-tonga, Zulu-Kafirs, Awemba and some of the East Coast tribes), there is nevertheless a great diversity in outward appearance, shape of head and other physical characteristics, among the negroes who inhabit Bantu Africa. Some tribes speaking Bantu languages are dwarfs or dwarfish, and belong to the group of Forest Pygmies. Others betray relationship to the Hottentots; others again cannot be distinguished from the most exaggerated types of the black West African negro. Others again, especially on the north, are of Gala (Galla) or Nilotic origin. We have no clue at present to the exact birth-place of the Bantu, nor to the particular group of dialects or languages from which it sprang. Perhaps in grammatical construction (suffixes taking the place of prefixes), Fulani shows suggestive resemblance.

In the north-west of the Bantu field, in the region between Cameroon and the north-western basin of the Congo, the Cross river and the Benue, there is an area of great extent occupied by languages of a "semi-Bantu" character. The resemblances to the Bantu in certain word-roots are of an obvious nature; and prefixes in a very simple form are generally used for singular and plural, but the rest of the concord is very doubtful. Here, however, we have the nearest relations of the Bantu, so far as etymology of word-roots is concerned. Further evidence of slight etymological and even grammatical relationships may be traced as far west as the lower Niger and northern and western Gold Coast languages (and, in some word-roots, the Mandingo group).

The legends and traditions of the Bantu peoples themselves invariably point to a northern origin, and a period, not wholly removed from their racial remembrance, when they were strangers in their present lands. The areas in which are spoken Bantu languages of typical structure and archaic form are somewhat widely spread. Perhaps on the whole the most archaic dialects at the present day are those of Mount Elgon, Ruwenzori, Unyoro, Uganda, the north coast of Tanganyika and of the Bemba country to the south-west of Tanganyika; also those in the vicinity of Lake Bangweulu, and the Nkonde and Kese dialects of the north and north-east coasts of Lake Nyasa; also (markedly) the Subiya speech of the western Zambezi. The Zulu-Kafir language, despite marked changes and deviations in vocabulary and phonetics (both probably of recent date), preserves a few characteristics of the hypothetical mother-tongue.

Classification.—On a geographical basis 11 distinct groups are recognized: (1) Northern or Ganda; (2) Ruanda, North-eastern Tanganyika; (3) North-eastern or Kilimanjaro; (4) Eastern, including Swahili; (5) East African group; (6) South-eastern group; (7) Zulu group; (8) Central group; (9) Western group; (10) Congo group, and (11) North-west group. Sir Harry Johnston proposed a more elaborate classification on linguistic data, and other authorities have put forward schemes based on philological principles. Much of the difficulty is due to imperfect knowledge and to deficiency of material—especially in regard to the phonetic variations (*see SANDAWE*). The discovery that tones are used in Bantu languages points to the need for an exhaustive investigation by modern methods of the phonology of this great language family.

Phonology.—The phonology of the Western group is akin to that of the Negro languages of Western and West-Central Africa. Zulu has picked up clicks, perhaps borrowed from the Hottentots and Bushmen. Here and there on the borders of the Western group, the peculiar West African combinations of *kp* and *gb*, so characteristic of African speech between the Upper Nile and the Guinea coast, have been adopted.

The special features of the Bantu languages are:—

Syntax.—(1) The syntax is formed by adding prefixes principally and also suffixes to the root, but no infixes (that is to say, no mutable syllable incorporated into the middle of the root-word).

(2) The root excepting its terminal vowel is practically unchanging, though its first or penultimate vowel or consonant may be modified in pronunciation by the preceding prefix, or the last vowel in the same way by the succeeding suffix.

(3) The vowels of the Bantu languages are always of the Italian type, and no true Bantu language includes obscure sounds like *ö* and *ü*. Each word must end in a vowel (though in some modern dialects in Eastern Equatorial, West and South Africa the terminal vowel may be elided in rapid pronunciation, or be dropped, or absorbed in the terminal consonant, generally a nasal). No two consonants can come together without an intervening vowel, except in the case of a nasal, labial or sibilant. This does not preclude the *aspiration* of consonants, or the occasional local change of a palatal into a guttural. No consonant is doubled. Apparent exceptions occur to this last rule where two nasals, two *r*'s or two *d*'s come together through the elision of a vowel or a labial.

(4) Substantives are divided into classes or genders, indicated by the pronominal particle prefixed to the root. These prefixes are used either in a singular or in a plural sense. With the exception of the "abstract" prefix *Bu*, no singular prefix can be used as a plural nor vice versa. There is a certain degree of correspondence between the singular and plural prefixes. The number of prefixes common to the whole group is perhaps 16. The pronominal particle or prefix of the noun is attached as a prefix to the roots of the adjectives, pronouns, prepositions and verbs of the sentence which are connected with the governing noun; and though in course of time these particles may differ in form from the prefix of the substantive, they were akin in origin. The pronominal particles, whether in nominative or accusative case, must always precede the nominal, pronominal, adjectival and verbal roots, though they often follow the auxiliary prefix-participles used in conjugating verbs, and the roots of some prepositions.

(5) The root of the verb is the second person singular of the imperative.

(6) No *sexual gender* is recognized in the *pronouns* and *concord*. Sexual gender may be indicated by a male "prefix" of varying form, often identical with a word meaning "father," while there is a feminine prefix, *na* or *nya*, connected with the root meaning "mother," or a suffix *ka* or *kazi*, indicating "wife," "female." The first and second prefixes invariably indicate living beings and are usually restricted to humanity.

The 16 original prefixes of the Bantu languages are given on p. 81 in the most archaic forms to be found at the present day. The still older types of these prefixes met with in one or two languages, and deduced generally by the other forms of the particle used in the syntax, are given in brackets. It is possible that some of these

prefixes resulted from the combination of a demonstrative pronoun and a prefix indicating quality or number.

Singular		Plural	
Class	1. <i>Umu-</i> (<i>Ŋgu-mu-</i>).	Class	2. <i>Aba</i> (<i>Mba-ba</i> or <i>Ŋga-ba</i>).
"	3. <i>Umu-</i> (<i>Ŋgu-mu-</i>).	"	4. <i>Imi-</i> (<i>Ŋgi-mi-</i>).
"	5. <i>Idi</i> (<i>Ŋdi-di-</i>).	"	6. <i>Ama-</i> (<i>Ŋga-ma-</i>).
"	7. <i>Iki-</i> (<i>Ŋki-ki-</i>).	"	8. <i>Ibi-</i> (<i>Mbi-bi-</i>).
"	9. <i>I-n-</i> or <i>I-ni-</i> (<i>Ŋgi-ni-</i>).	"	10. <i>Ili-</i> , <i>Izi</i> , <i>Ili-n-</i> , <i>Izi-n</i> (<i>Ŋgi-ti-</i>).
"	11. <i>Ulu</i> (<i>Ndu-du-</i>).	"	12. <i>Ulu</i> (<i>ŊNtu-lu-</i>); often diminutive in sense.
"	13. <i>Aka</i> (<i>ŊNka-ku-</i>); usually diminutive, sometimes honorific.		
"	14. <i>Ubu-</i> (<i>ŊMbu-bu-</i>); sometimes used in a plural sense; generally employed to indicate abstract nouns.		
"	15. <i>Uku</i> (<i>ŊNku-ku-</i>); identical with the preposition "to," used as an infinitive with verbs, but also with certain nouns indicating primarily functions of the body.		
"	16. <i>Apa</i> (<i>Mpa-pa-</i>); locative; applied to nouns and other forms of speech to indicate place or position; identical with the adverb "here," as <i>Ku-</i> is with "there."		

To these 16 prefixes, the use of which is practically common to all members of the family, might perhaps be added No. 17, *Fi-* or *Vi-*, a prefix in the singular number, having a diminutive sense, which is found in some of the western and north-western Bantu tongues, chiefly in the northern half of the Congo basin and Cameroen. It is represented as far east (in the form of *I-*) as the Man'yema language on the Upper Congo, near Tanganyika. Prefix No. 18 is *Ogu-*, which has, as a plural prefix, No. 19, *Aga-*. These are both used in an augmentative sense, and their use seems to be confined to the Luganda and Masaba dialects, and perhaps some branches of the Unyoro language. The 20th prefix, *Mu-*, is really a preposition meaning "in" or "into," often combined in meaning with another particle, *-ni*, used always as a suffix. The 20th prefix, *Mu-*, however, does not have a complete concord, it is used adjectively or as a preposition and has no pronom. accusative.

The Bantu verb consists of a practically unchangeable root which is employed as the second person singular of the imperative. To this root are prefixed and suffixed various particles. These are worn-down verbs which have become auxiliaries or they are reduced adverbs or prepositions. A method of forming the preterite tense seems to be shared by a great number of widely-spread Bantu languages. Thus the Zulu *tanda*, love, changes to *tandile*, have loved, did love. This *-ile* or *-ili* may become in other forms *-idi*, *didi*, *-ire*, *-ine*, but is always referable back to some form like *-ili* or *ile*, which is probably connected with the root *li* or *di* (*ndi* or *ni*), which means "to be" or "exist." The initial *i* in the particle *-ile* often affects the last or penultimate syllable of the verbal root, thereby causing one of the very rare changes which take place in this vocable. In many Bantu dialects the root *pa* (which means to give) becomes *pele* in the preterite (no doubt from an original *pa-ile*). Likewise the Zulu *tandile* is a contraction of *tanda-ile*.

Two other frequent changes of the terminal vowel of the common root are those from *a* (which is almost invariably the terminal vowel of Bantu verbs), (1) into *e* to form the subjunctive tense, (2) into *i* to give a negative sense in certain tenses. With these exceptions the vowel *a* almost invariably terminates verbal roots. By changing the terminal vowel of the verbal root and possibly adding a personal prefix, one can make nouns from verbs. Thus in Luganda *senyua* is the verbal root for "to pardon" "A pardon" or "forgiveness" is *ki-senyuo*. "A pardoner" might be *mu-senyui*. In Swahili *pataniša* would be the verbal root for "conciliate"; *mpatanaši* is a "conciliator," and *upatanišo* is "conciliation." Bantu verbs modify the sense of the original verbal root by suffixes, the affixion of which modifies the terminal vowel and sometimes the preceding consonant of the root.

Thus an original Bantu root, *tanda*, to love, may become

<i>tandwa</i>	.	.	.	to be loved.
<i>tandeka</i> or <i>tandika</i>	.	.	.	to be lovable.
<i>tandila</i> or <i>tandela</i>	.	.	.	to love for, with, or by some other person.
<i>tandisa</i> (or <i>-esa</i>)	}	.	.	to cause to love
<i>tandisa</i> (or <i>-esa</i>)	}	.	.	
<i>tamlana</i>	.	.	.	to love reciprocally.

The suffix *-aka* or *aŋga* sometimes appears and gives a sense of continuance to the verbal root. Thus *tanda* may become *tandaku* in the sense of "to continue loving." Although *tanda* is a common verb in Zulu, it has not in Zulu all these variations, and in some other language where it may by chance exhibit all the variations its own form is changed to *londa* or *randu*.

The negative verbal particle in the Bantu languages may be traced back to an original *ka*, *ta* or *sa*, *ki*, *ti* or *si* in the Bantu mother-tongue. These alternative forms resemble those in some West African Negro languages. In the vast majority of the Bantu dialects at the present day, the negative particle in the verb (which nearly always coalesces with the pronominal particle) is descended from this *ka*, *ta* or *sa*, *ki*, *ti* or *si*, assuming the forms of *ka*, *ga*, *ŋga*, *sa*, *ta*, *ha*, *a*, *ti*, *si*, *hi*, etc. Sometimes in the modern languages the negative particle (such as *ti* or *si*) is used without any vestige of a pronoun being attached to it and is applied indifferently to all the persons. Occasionally this particle has fallen out of use, and the negative is expressed (1) by stress or accent; (2) by suffix (traceable to a root *-pe* or *-ko*) answering to the French *pas*, and having the same sense; and (3) by the separate employment of an adverb. In some languages, the verb used in a negative sense changes its terminal *-a* to *-i*. The subjunctive is very frequently formed by changing the terminal *-a* to *-e*: thus, *tanda* = love; *tande* = may love.

BANVILLE, THÉODORE FAULLAIN DE (1823-1891), French poet and miscellaneous writer, was born at Moulins in the Bourbonnais, on March 14, 1823, and died in Paris on March 15, 1891. In 1842 he published his first volume of verse (*Les Cariatides*), which was followed by *Les Stalactites* in 1846. The poems won for their author the approbation and friendship of Alfred de Vigny and Jules Janin. He printed other volumes of verse, among which the *Odes funambulesques* (Alençon, 1857) received unstinted praise from Victor Hugo, to whom they were dedicated. Later, several of his comedies in verse were produced at the Théâtre Français and on other stages; and from 1853 onwards a stream of prose flowed from his industrious pen, including studies of Parisian manners, sketches of well-known persons (*Camées parisiennes*, etc.), and a series of tales (*Contes bourgeois*, *Contes héroïques*, etc.), most of which were republished in his collected works (1875-78). He also wrote freely for reviews, and acted as dramatic critic for more than one newspaper. Throughout a life spent mainly in Paris, Banville's genial character and cultivated mind won him the friendship of the chief men of letters of his time. Banville's claim to remembrance rests mainly on his poetry. A careful and loving student of the finest models, he did even more than his greater and somewhat older comrades, Victor Hugo, Alfred de Musset, and Théophile Gautier, to free French poetry from the fetters of metre and mannerism in which it had limped from the days of Malherbe. In the *Odes funambulesques* and elsewhere he revived with perfect grace and understanding the *rondeau* and the *villanelle*, and like Victor Hugo in *Les Orientales*, wrote *pantoums* (pantuns) after the Malay fashion. He published in 1872 a *Petit traité de versification française* in exposition of his metrical methods. He was a master of delicate satire and used with much

effect the difficult humour of sheer bathos, happily adapted by him from some of the early folk-songs.

Among his other works may be mentioned the poems, *Idylles prussiennes* (1871), and *Trente-six ballades joyeuses* (1875); the prose tales, *Les Saltimbanques* (1853); *Esquisses parisiennes* (1859) and *Contes féeriques*; and the plays, *Le Feuilletton d'Aristophane* (1852) *Gringoire* (1866), and *Deidamia* (1876).

BANYAN, a well-known tree of which the scientific name is *Ficus benghalensis*. It belongs to the mulberry family (Moraceae) and is notable for the aerial roots which grow from the branches and on reaching the soil thicken and form supporting pillars. By this means the tree may cover an immense area. The tree is sacred in India. (See also article *FICUS*) The name was originally given by Europeans to a tree on the Persian Gulf beneath which some Hindu "merchants" had built a pagoda. In Calcutta the word was generally applied to a native broker or head clerk in any business or private house, now known as *sircar*. *Bunya*, a corruption of the word common in Bengal, is usually applied to the native grain-dealer. Early writers sometimes use the term generically for all Hindus in western India. *Banyan* was Anglo-Indian for an undershirt, in allusion to the body garment of the Hindus, especially the Banyans.

In the British navy *Banyan days* were formerly the two days in each week on which meat was excluded from the men's rations, in allusion to the vegetarian diet of the Hindu merchants. *Banyan hospital* was a slang term for a hospital for animals, in reference to the Hindu's dislike of taking animal life as a principle of their religion.

BAOBAB, *Adansonia digitata* (family Bombacaceae), a native of tropical Africa, one of the largest trees known, its stem reaching 30 ft. in diameter, though the height is not great. It has a large woody fruit, containing a mucilaginous pulp, with a pleasant cool taste, in which the seeds are buried. The bark yields a strong fibre used for ropes and cloth. The wood is light and soft, and the trunks of living trees are often excavated to form houses.

BAOULE, a short, dark-skinned, animistic people, on the French Ivory Coast between the Comoé and Bandama rivers, who migrated thither from the Gold Coast somewhere about the 16th century, being joined later (c. 1730) by noble families of Ashanti origin; the Warebo family ruled them for a time but was unable to maintain its authority. They now live in independent villages, formed of extended family groups. There are no special marriage rules and the women enjoy great freedom. Succession passes to uterine brothers, then to nephews and maternal uncles. They practice cultivation, arboriculture and gold-seeking.

See Delafosse, *Manuel de la Langue Agni* (1900).

BAPAUME-PÉRONNE: see AMIENS, BATTLE OF.

BAPHOMET, the imaginary symbol or idol which the Knights Templars were accused of worshipping in their secret rites, in which they were supposed to have revived the impurities of the gnostic Ophites. (See OPHITES; TEMPLARS.)

BAPTISM. Concerning the origin of Christian baptism we cannot make statements which are certain. Jesus indeed let himself be baptised by John the Baptist; but that he himself baptised is nowhere reported, and it is expressly contested by S. John's Gospel, iv. 2. In the same passage, however (and in iii. 22), it is asserted that the disciples had already administered baptism in Jesus' life-time, a report which we have every reason to treat with the greatest scepticism. In the primitive community, on the other hand, baptism is universally practised as a rite of admission into the Christian community, and we meet with it as an institution taken for granted both in the circles of the Jerusalem community and in the mission districts of the Apostle Paul. Paul himself is baptised after his conversion (Acts ix. 18), he himself baptised and had the ceremony performed by his assistants (1 Cor. i. 16), and, what is of special importance, he assumes that all those who belong to the Christian community, Pagans as well as Jews, are baptised (1 Cor., xii. 13).

Jewish and Christian Baptism.—The act itself took place without special preparation, as soon as the new convert confessed his faith in Christ and desired to become a member of the community: the baptism of the eunuch of Queen Candace (Acts viii. 38) is a good instance of this. Everywhere in the oldest sources it is stated that baptism takes place "in the name of Jesus." For the first time in the relatively late final chapter of S. Matthew's Gospel the command to baptise with the trinitarian formula (in the name of the Father and of the Son and of the Holy Spirit, Mt. xxviii. 19) is put into the mouth of Jesus.

The so-called Jewish baptism of proselytes has been pointed to in explanation of this rite. It was in fact a strict regulation that a pagan convert to Judaism must, after his circumcision, go through a purificatory washing (Lev. xv. Num. xix.) which washed from him his pagan impurity, and its execution made him for the first time a member, fully qualified and with full status, of the people of Israel. It cannot be denied that this proselyte baptism has great similarity to Christian baptism. Yet it can be said definitely that Christian baptism cannot be derived from this Jewish prototype, because Christian *Jews* also had to undergo Christian baptism, whilst the meaning of proselyte baptism, as the washing away of ritual impurity, could only have been considered in relation to pagans. We hear further of a baptism as a ceremony of admission in the mysterious Jewish order of the Essenes; and here baptism appears to have had a sacramental meaning which was more than symbolic or ritual: yet our information, especially about the diffusion of the Essenes and their significance in the whole system of the Jewish people, is too scanty to allow with any probability of the connection of Christian baptism with these reports.

What lies nearest to hand is to start rather from the baptism which Jesus himself underwent, namely the baptism of John. Though much in the picture of this prophet of the wilderness may be enigmatical and in dispute, yet so much is clear from all the reports, that he baptised Jews and pagans without distinction in the Jordan to the confession and forgiveness of sins, and that he connected with this action the proclamation of the approaching kingdom of God as a judgment. His baptism was thus not a levitical purificatory washing, but signified a spiritual turning away from sins and the entry into a new and purer life. We know that round the person of John there gathered a circle of disciples which survived his death and meets us more than once at a later time (Acts xviii. 25; xix. 3. *Clem. Recog.* i. 54). At the present time it is a subject of lively discussion whether the still existent sect of the Mandaeans (see MANDAEANS), whose sacred writings are extensively preserved for us, is perhaps the last remnant of a religious society which can be traced back in direct succession to the communities of disciples of John. The religious world of ideas of these writings also, saturated with hellenistic-iranian mysticism, are in this case commonly traced back to the circle of the disciples of John the Baptist. Yet all this is very questionable conjecture, and important arguments render not improbable the conclusion that the Mandaean sect is of post-islamic origin and has no kind of historical connection with the early extinct sect of John's disciples. At all events, we shall do well to confine ourselves to the reliable ancient accounts of John the Baptist and to accept with reserve even the sacramental significance which Josephus (*Ant.* xviii. 117) ascribes to the baptism of John. As at all events the Christian community regarded Jesus as the fulfiller of the message of John and in a certain sense as the executor of his will, the taking over of the rite of baptism can be interpreted as a Johannine heritage for the primitive community. We must, however, be clear that the motives for so taking it over are and remain in the end unknown.

The Apostolic Age.—Whether the judaic primitive community formulated special theological ideas about baptism, we are not informed, and no probable conjecture enables us to infer that it was so. On the other hand with the Apostle Paul we come upon a developed sacramental theology. In 1 Cor. x., baptism appears as a sacrament already foreshadowed in the Old Testament, and in Rom. vi. a fully articulated doctrine of the nature of baptism is produced in connection with the question of the Christian's

relation to sin. When in the ceremony the candidate for baptism is submerged under the water, he is thereby buried with Christ and dies with him; i.e., this submersion in water is for the Apostle, not merely a symbol of purification, nor only a *symbol* of being buried, but a real act of wonderful effect. The candidate for baptism experiences actually and genuinely the death of Jesus in his own body, and is likewise actually laid in the grave, as Jesus lay in the grave. And thereby the saving effect of these events too is transferred to him. He dies and in doing so pays to sin the tribute due: for the wages of sin is death. When he emerges again from the water, the resurrection of Christ becomes his. He who was dead awakes to new life, but under quite other conditions than those which governed his mode of life hitherto. If till then the world-encircling power of sin exercised its dominion in the flesh without restraint, now that is possible no more. The flesh, dead in the sacramental union with Christ, has become free from the power of sin, which till now worked upon it with the force of a law of nature. As Christ rose from the dead through the spirit of God which gave him life, so too is the baptised Christian equipped with the new life-principle of the divine spirit, and can fulfil the ordinance of the law (Rom. viii. 4). He is a new creature: the old man is dead and all is become new (2 Cor. v. 17). How realistically the effect of baptism is conceived is evident also from a curious custom which was the practice in Corinth (1 Cor. xv. 29). If a Christian died there unbaptised, another had himself baptised in the place of the dead person, naturally in the belief that the sacramental action would also have its effect in the other world upon the person who had died. And traces of this "vicarious baptism" can actually be shown in various places even into the 4th century.

Parallels of the Pauline Doctrine.—To the comparative study of religion the connections which unite this Pauline doctrine of baptism to the kindred notions of other religions could not remain hidden. It is not necessary to go back to the religious ideas of primitive peoples, among whom the entry into the clan or into a particular group is celebrated by ceremonies which express the death and new birth of the individual concerned. It is of much greater significance that we can trace numerous views of the kind in the civilization by which early Christianity was surrounded. These parallels had already struck the ancient Christian writers, been noted by them, and explained in various ways. We are particularly well informed about the ideas associated with the initiation rites of the initiates in the Isis Mysteries. The African Apuleius, who wrote about A.D. 160, informs us that the disciple had to undergo a ceremony of sanctification, which was celebrated in the likeness of a voluntary death followed by salvation won through prayers: when, namely, a man, his natural life complete, shall stand already on the threshold of the light departing and be so qualified that the great secrets of religion could safely be confided to him, then the Goddess would call him back from death and set in the way of new salvation the man who, through her care, was as it were born again. And so, too, the hero in the romance of Apuleius signifies the day of his consecration to Isis as his "holy birthday," and reports that he approached the bounds of death, that he trod the threshold of Proserpina, and then returned back through all the elements, that at midnight he saw the sun shining with bright light, that he approached the gods of the world below and of the world above, and adored them face to face.

The Isis Mysteries were spread over the whole Roman Empire in a form suited for world propaganda, and there is no doubt that the leading ideas here expressed had their root in the ancient Egyptian religion (the cult of Osiris) and have suffered slight modifications by the spirit of Græco-oriental mysticism. In the cult of Attis and Adonis also we meet with a god who, like Osiris, dies and awakes to life again, and whose fate is lived through in figure by the member of his community. From our knowledge, even though in general it is very scanty and embraces only limited fragments of the variegated piety of the early Empire, the conjecture that the circle of ideas mentioned exercised its effect in all kinds of other places besides amounts almost to certainty. When, therefore, in the communities of the

Apostle Paul we meet with so kindred an interpretation of Christian baptism, we can definitely assume an influence from extra-Christian piety. It must only remain questionable whether this sacramental theology was introduced into the Christian community directly by baptised pagans, or whether it had already taken hold here and there of "liberal" Greek-speaking Judaism, and so entered into Christianity as a semi-Jewish way of thinking.

Baptism in the Early Church.—The early Church developed further both the liturgical expression and the theological interpretation of baptism in the direction marked out by Paul. In the first place a liturgical regulation of the procedure of baptism arose out of the freedom of the early period. Before the act itself a longer instruction of the candidates for baptism, the training of catechumens, is prescribed. And as the life of the community adapted itself to settled forms of order, so a definite time in the course of the year was fixed for the training of catechumens: it took place in the season of fast which preceded Easter. Then the spiritual leader of the community collected all those who were to receive baptism into a group for training and baptised them also together at the one period which in early times was fixed for baptism, viz., on Easter Eve; later the Epiphany festival of 6 January, as the day of commemoration of the baptism of Christ, was added, and also the whole Easter period up to Whitsuntide was occasionally regarded as a permissible time for baptism. Naturally, baptism could be administered at any time to those dangerously ill. Gradually the character of baptism as a Mystery was with conscious purpose more and more emphasized, and this was also given expression in external details: thus arose the *disciplina arcana*, which bound the candidate for baptism to mysterious silence concerning things which were held to be essential points of the Mystery—which nevertheless everyone could come to know who desired to. Thus the baptismal creed (*see CREEDS*) was learned by heart in the catechumens' training, because probably it was not allowed to be written down (*traditio symboli*), and then in the act of preparation for baptism it was solemnly proclaimed by the candidate (*redditio symboli*).

The baptism was preceded by a fast, it might be of several days; then the ceremony began on Easter Eve. The following is a description of it in accordance with the statements of Cyril of Jerusalem (*circ.* 340). The candidates for baptism are led into the vestibule of the baptistry and there drawn up facing west. Then they stretch out their hands to the west and call: "I renounce thee, Satan, and all thy works and all thy being." Then they turn round and eastwards, as to the land of light, confess the creed. Now they enter the inner room of the baptistry and divest themselves completely of their garments. They are anointed from head to foot with exorcised oil and led to the baptismal tank. Each makes answer to the threefold question, if he believes in Father, Son and Holy Ghost, with the prescribed formula and is submerged at each confession, three times therefore. When he has come up from the tank he is again anointed with holy oil (*chrisma*) on the forehead, ears, nose and breast, and clothed in a white garment, the outward sign of the purity from sin he has won through the sacrament. At once the procession of candidates enters the church and partakes for the first time of the Eucharist. In Egypt, Italy and Africa, the custom survived till the 5th century of giving to the newly baptised, in addition to the wine, a mixture of milk and honey, as a neophyte communion: apparently also a custom taken over from the hellenistic Mysteries.

Theological Developments of the 3rd and 4th Centuries.

—According to the view of the whole early Church, baptism is a sacrament unconditionally necessary for the Christian: the one and only substitute for it is the baptism of blood of martyrdom; for whoever, even without having received baptism, suffers death for his confession of Christ, will without doubt be reckoned by Christ among His own. But in addition baptism cannot be repeated: only once can a man die in Christ and be born again. In consequence of this a controversy arose in the middle of the 3rd century in Africa, known as the controversy over heretical baptism, and became of fundamental significance for succeeding ages. After the Decian persecution (A.D. 250) the sect of the Novatians

had separated itself from the Church. Yet when some years were passed, many returned penitently to the Church. In the meanwhile they had received baptism in the sect of the Novatians. The problem now arose for the Carthaginian bishop Cyprian, whether he should reckon this baptism performed by heretics as a real baptism or not. He adopted the standpoint that outside the Church there is no salvation (*extra ecclesiam nulla salus*) and drew the conclusion that there can be no real sacraments outside the Church. In his opinion, therefore, heretical baptism was a ceremony without significance, and thus, as occasion arose, he baptised the returned heretics afresh.

In Rome the opposite decision in the same question had been reached: the idea of a sacrament was developed more vigorously and regarded as effective quite independently of the worthiness of him who administered it and of the surrounding community. He who has received baptism, even if it be in the circle of heretics, is incorporated into the community of Jesus, and only his severance from the heretical community and his union with the Catholic Church is needed to bring out also the saving effect of the sacrament. Heretical baptism was thus recognised in Rome. For half a century Africa maintained its practice, then the Roman standpoint prevailed, and has ultimately remained till the present day decisive for our church practice. At a later time only did the Roman Catholic Church begin to question, on grounds of form, the correctness of protestant baptisms, and to make use of the safety provision of a "conditional" re-baptism, in the form: "in case thou shouldst not have been baptised, I baptise thee," etc.

The whole early period knows baptism only for adults, who join themselves of their own resolve to the Christian community. Infant baptism appears sporadically towards the end of the second century and was indeed practised also during the following centuries, yet only as an exception. In contrast to it the custom was widespread rather of postponing the baptism even of adults as long as possible in the prudent calculation that the complete forgiveness of sins conferred by baptism might be first undertaken at a time when the person considered that he had the main period of transgression behind him. For the effectiveness for the forgiveness of sins of the sacrament of penance, which alone was still available to one already baptised, was by no means free from all doubt in the belief of the people.

Influence of St. Augustine.—The theorist of baptism who has been most influential for succeeding ages is S. Augustine. He develops the Pauline idea, according to which the baptised person is engrafted as a member into the community which forms the body of Christ. The first effect of baptism is the forgiveness of sins, which extends itself to all sins, both to all actual sin and also to original sin. This latter sinfulness, inherited from Adam, would indeed alone suffice, without actual sin, to bring man to damnation, as, too, infants dying unbaptised are excluded from the Kingdom of heaven in consequence of original sin, and live in the world beyond in some form of perdition, even if of the mildest kind. Baptism has effect upon original sin, in the sense that it takes from it its character of guilt: thereby free access to God and His heavenly kingdom is opened. But there remains the material effect of original sin which shows itself in the inclination to evil (*concupiscentia*). This remains even in the baptised Christian, and accurately regarded it must remain, because without it no moral struggle, no overcoming of evil in meritorious conflict with sin, would be possible. But this concupiscence is not guilty in one who is baptised: the commission of fresh actual sin first makes the Christian once more guilty before God. Infant baptism, when practised early, will, as a rule, count only as the effacement of original sin. But the child still receives, just as does the adult, the positive effect of the Holy Spirit, which expresses itself in his case as protection, guarding him from evil influences and allowing him to grow towards maturity, till the time when he shall consciously make his own what was received in baptism and confessed through the mouth of the sponsor representing him, and become in the full sense a Christian personality.

The Mediaeval Period.—The mediaeval development altered little in the practice and theory of baptism. The ritual is modified

here and there in the various countries, but is preserved everywhere in its essential points. Western theology in the main builds further on the foundation supplied by Augustine and develops all kinds of conceptual distinctions, which leave the essence of the matter untouched. The Augustinian doctrine also of the effacement of original sin as guilt and of the retention of concupiscence as tinder for sin (*fomes peccati*) is retained and still more minutely elaborated. Baptism appears as one of the two sacraments (the other is the ordination of priests), which confer an indelible character (*character indelibilis*). Whoever has received this sacrament bears indelible to all eternity the mark of Christ. Through it alone man obtains the right and the capacity to receive also the other Christian sacraments. Of considerable practical importance became the theory of the three baptisms. The first is the baptism of water, the second the martyr's baptism of blood, the third the baptism by desire (*baptismus flammis*=spiritual baptism) of him who finds himself in peril of death, who would fain be baptised, but cannot owing to external circumstances receive the sacrament. Certainly in such a case a priest is not required: in peril of death a layman is justified in administering the sacrament of baptism to him who is endangered. But where that too is denied, God will reckon as fulfilled the wish of one who desires baptism. For that he has the desire is an evident sign of the working of divine grace. He possesses therefore what is essential in the sacrament, the *res sacramenti*; even though the form, the *sacramentum*, is lacking. (H. L.)

BAPTISM DURING AND AFTER THE REFORMATION

At its fifth session (June 1546) the Council of Trent drew up a decree on Original Sin which defined the doctrine of the Roman Church on the grace of Baptism. The decree steers a middle course between the Thomist (or Augustinian) and the Scotist doctrines of the nature of man and the consequences of the Fall. The sin of Adam passes to all his descendants and can only be removed by the merit of Jesus Christ which is conferred in the Church, by the sacrament of Baptism. By regeneration in Baptism original sin and actual sins already committed are remitted, but there remains in the regenerate concupiscence, the "fomes" (tinder) of sin. This concupiscence, though it comes from sin and leads to sin, yet is not itself sin. At its seventh session (March 1547) the Council promulgated 14 anathemas designed to rule out the new teachings on Baptism which had arisen through the Reformation.

The teachings of the Reformers on Baptism represent varying modifications of the traditional doctrine under the influence of the cardinal principle—"Justification by Faith."

Luther and Zwingli.—In his sacramental teaching Luther closely associates the Sacrament with the Word. There can be no sacrament apart from an express divine promise to which faith may respond. It is not easy to accommodate this fundamental conception of the nature of a Sacrament to the practice of infant Baptism. To that practice Luther consistently adhered, but his justification of the practice differed at different periods of his life. In 1518 he still held that the infant is regenerated and saved through the merit of the faith of its sponsors; in 1520 (*De Captiv. Babyl. Eccl.*) he abandons this view and holds that in Baptism infants themselves believe. If God can turn the heart of the wicked, much more can he turn the heart of a child. After 1528 without abandoning the view that infants themselves believe, Luther tends to base his defence upon the scriptural texts Matt. xxviii, 19; Mk. x., 14. The doctrine of original sin inevitably influenced his thought: since all men are born in sin, it was necessary that they should as infants be brought into the relation of grace. Luther seems not to depart from the scholastic doctrine that Baptism confers indelible "character," but he differs from Roman doctrine in ascribing to Baptism unlimited forgiveness of sin. Post-baptismal sin does not require the special grace of a fresh sacrament—penance; rather, in Luther's view, does penance throw the penitent back upon the all-sufficient grace of God of which he was assured in his Baptism.

Zwingli's doctrine of Baptism is more radical than Luther's. The outward washing is a token of the grace which the believer already possesses—if an adult, in virtue of previous hearing of the word,

if an infant, in virtue of God's promise that the children of Christian parents are as much members of the Christian Church, as Jewish children were members of the Jewish Church. "It is an external thing when men are baptized—a sign and ceremony of the true reality (*rei*) . . . ceremonies are outer signs which testify to others that he who receives them has bound himself to a new life, and that he will confess Christ till death" (*De ver. et fals. rel. Werke* III., p. 773).

Calvin and Hooker.—Calvin lays more stress than Zwingli upon the value of the rite to him who receives it, as being a confirmation of God's promise. Baptism is the seal upon election, and the solemn sign by which those who already belong to Christ's Body are received into the Church (cf. *Instit.* IV. 15, 22). It was in keeping with this view of Baptism that Calvin rejected the literal interpretation of Joh. iii., 5 "Except a man be born of water and the spirit. . . ." It was to be explained on the analogy of Matt. iii., 11 "He shall baptize you with the Holy Ghost and with fire." Regeneration was not more contingent upon literal water than it was upon literal fire. Baptism of infants *in extremis* he regarded as a superstition. Baptism should not be administered by others than ministers, nor elsewhere than in the Church.

The Calvinistic doctrine of Election stands in the background of Hooker's Baptismal teaching, but it is not allowed to dictate the interpretation of Joh. iii., 5 or the practice of the Church: the expressed promise of God attaches to Baptism by water: infants should therefore be baptized—if necessary by laymen or even women.

Infant Baptism.—The great Reformers shared the main political presuppositions of the Middle Age. To them Church and State were aspects of one society, and the ecclesiastical outcome of the Reformation was the rise of independent national Churches. A Church conceived as virtually co-extensive with Society is unlikely to reject the principle of infant Baptism. But the sectarian idea of the Church as the society of the Saints independent of, if not hostile to, the order of secular society was a not unnatural sequel of the doctrine of Justification by Faith only; and not unnaturally it took the form of a rejection of infant Baptism. Zwingli himself at the beginning of his career as a Reformer had felt doubts about the baptism of infants, but the extravagances of the Anabaptists at Zurich confirmed him in accepting the principle of infant Baptism. The excesses of the reign of the Saints at Münster discredited the Anabaptists, but their position with regard to the Baptism of believers only was inherited by the Menonites and by other Baptist Churches.

A further influence which no doubt strengthened the Reformers in their adherence to the practice of infant Baptism was the doctrine of Original Sin. If infants were born in sin it would seem desirable and right that they should receive the sacrament of regeneration. It is worthy of notice that the sectaries of the 16th century were less consistently Augustinian than the great Reformers in their doctrine of sin and that the General Baptists of the 17th century were avowedly Arminian.

"The Children of Light" (the Quakers) carry the doctrines of the Sectaries a stage further. All external authority and all outward rite, is, in principle, set aside. "The testimony of the spirit is that alone by which the true knowledge of God hath been, is, and can be only revealed." Adam's posterity is fallen, and, apart from God's Grace, deprived of the sensation of this inward testimony. "Nevertheless this seed [of the serpent] is not imputed to infants, until by transgression they actually join themselves therewith." "Baptism is a pure and spiritual thing, to wit the Baptism of the spirit and fire . . . of which the Baptism of John was a figure, which was commanded for a time, and not to continue for ever; as to the Baptism of infants it is a meer humane tradition, for which neither Precept nor Practice is to be found in all the Scripture." (*Barclay Apology*, Theses Theol. i., iv., xii.)

Modern Reinterpretations.—The rise of rationalism further disintegrated belief in original Sin and weakened the sense of dependence upon divine grace. Baptism tended to be regarded as an outward rite signifying the adherence of the individual to the Church, rather than as a means of Grace or a seal of regeneration.

In the revival of Church consciousness in the 19th century Bap-

tism takes on a deeper meaning. Original sin is asserted afresh, but it is re-interpreted as a social rather than a biological inheritance. Baptism is the act of the Church incorporating a new member into its own life. Schleiermacher's criticisms of Zwingli and Quakers give forcible expression to this view of Baptism. If the act of Baptism be considered in itself, Zwingli's theory of the Sacrament may be allowed to be true. But it is not the whole truth. It errs in ignoring the dependence of Baptism upon the activity of the Spirit in the Church. Similarly the Quaker rejection of water-Baptism has a certain justification in that it rests upon the desire to exalt the idea of regeneration at the expense of the ceremony as such. But it errs, in that it fails to do justice to the relation between the influences of the society and "the inner development of the individual towards regeneration." Infant Baptism, Schleiermacher holds, is incomplete Baptism: the confession of faith at Confirmation after full instruction should be regarded as the final act which completes the Baptism. (*Der Christliche Glaube*, 2nd ed. §§ 136–138.)

So too, to Ritschl, Baptism is primarily an act of the Church. The Church by Baptism associates the individual with that revelation of God on which its own existence depends. Washing with water symbolises purification of the spiritual life and this purification is effected by adoption into "the circle of reconciliation." The rite then is not the mere confession of the individual but the act of the society, and this carries with it the justification of infant Baptism (*Unterricht in der Christlichen Religion*, 3rd ed. Bonn 1886 § 89).

Anglican Internal Controversy.—Baptismal doctrine became the subject of an important internal controversy in the Church of England in the second quarter of the nineteenth century. Baptismal doctrine had not been prominent in the theological controversies of the 16th and 17th centuries in England. The Baptismal formularies of the Church of England had been drawn up under Lutheran rather than Calvinistic influences, and they use language which implies that an infant is regenerated in Baptism. The Anglican service however had been continuously used by many who held the Calvinistic doctrine of election, and their right to use it had not been disputed, albeit their doctrine required a "conditional" interpretation of the language concerning regeneration. Not all who were baptized were regenerate. Regeneration was conditional on repentance and faith, and these were bestowed not by Baptism, but by "prevenient grace." The Evangelical party in the Church of England was largely Calvinistic. Though accepting the general necessity of Baptism, it associated regeneration with conversion rather than with Baptism. Pusey's Tracts for the Times Nos. 67, 68, 69 re-asserted the Catholic (and Lutheran) view that regeneration is bestowed upon all who are baptized. Gorham represented the Evangelical position and the question at issue was whether the Catholic interpretation of the formularies was alone to be admitted. The Gorham Judgment of the Judicial Committee of the Privy Council upheld Gorham's interpretation as legitimate (1850). The leaders of the High Church party protested against the Judgment, and it was the occasion of the secession of Manning, the future Cardinal Archbishop of Westminster, to the Church of Rome. J. B. Mozley, himself a High Church Theologian, produced a weighty treatise upon the controversy, in which he maintained that the Gorham Judgment did but confirm the liberty which Calvinistic theology had continuously enjoyed in the Church of England.

Present Status.—In the later decades of the century controversial interest in the doctrine of Baptism abated. The strict conception of original sin—the starting point of Catholic and Calvinist alike—as well as the idea of Predestination was losing its hold upon the mind and imagination of Christians. Moreover the critical and historical study of Christian origins, which was little known or practised in England before the middle of the century, was changing the entire method of theological argument. The importance of Baptism in the early Church is seen to have been not less than was formerly assumed, but there is a widespread consciousness of the difficulties which arise, when language of the New Testament which clearly has adult Baptism in view is transferred to the entirely different situation which the general prac-

tice of infant Baptism has created. There does not however appear to have been any pronounced tendency to break with the tradition of infant Baptism, which indeed admits of an obvious justification when incorporation into the life of the Christian Society is the dominant idea associated with the rite. (J. M. C.)

BAPTISTE, NICOLAS ANSELME (1761-1835), French actor, was born in Bordeaux on June 18 1761, the elder son of Joseph François Anselme, a popular actor. Nicolas Anselme made his first appearance as de Belloy in *Gaston et Bayard*. After some time spent at Arras, where he played all kinds of parts, and at Rouen (1783-91), he was engaged at Langlois-Courcelles' new theatre in Paris, where he secured the engagement of his family also. Nicolas soon obtained the public favour, specially in La Martellière's mediocre *Robert, chef de brigands*, and as Count Almaviva in Beaumarchais' *La Mère coupable*. His success secured for him a place in the Théâtre de la République. Later he, as well as his younger brother, became *sociétaire*. Nicolas acted in both comedy and tragedy but was more at home in comedy. He retired in 1828. But after the revolution of 1830, when the Théâtre Français was in great straits, the brothers

Baptiste reappeared on the stage and helped to bring back its prosperity. The elder died in Paris on Dec. 1 1835. The younger brother, Paul Eustache Anselme, known as **BAPTISTE cadet** (1765-1839), was also a comedian of great talent, and had a long and brilliant career at the Comédie Française, where he made his *début* in 1792 in *L'Amour et l'intérêt*.

BAPTISTERY, the hall or chapel connected with a church, in which the sacrament of baptism is administered. The earliest baptistery extant is probably that of the Lateran palace in Rome, which dates largely from the time of Constantine. Octagonal in shape, this baptistery consists of a central area in which was the large octagonal basin or pool called a font, surrounded by eight columns, and an ambulatory (q.v.). The round church of Santa Costanza, in Rome, built, probably, as a tomb for the daughter of Constantine, was also used, in early times, as a baptistery. Following this tradition, baptisteries, throughout the early Church, were separate buildings, circular or polygonal in plan, up to the 9th or 10th century. When the change from immersion to sprinkling as the method of baptism rendered large baptisteries unnecessary, the baptistery became a mere chapel within a church, or even disappeared entirely, the font being placed at any convenient spot. Many baptisteries of the earlier type, especially in Italy, are of great size and richly decorated (Florence, Pisa). In modern usage the baptistery is frequently near the church entrance. The use of immersion, by the modern Baptist Church, has given a new importance to the baptistery in churches of that denomination, where it is often placed immediately behind the chancel, so that the sacrament may take place in the full view of the assembled congregation.

See C. von Hefele, *Conciles*, *passim*; Du Cange, *Glossary*, article "Baptisterium"; Eusebius, *Hist. Eccl.* x. 4; Joseph Bingham, *Antiquities of the Christian Church*, book xi. (1710-22).

BAPTISTS, a body of Christians, distinguished, as their name imports, from other denominations by the view they hold respecting the ordinance of baptism (*q.v.*). This distinctive view, common and peculiar to all Baptists, is that baptism should be administered to believers only. The mode of administration of the ordinance has not always been the same, and some Baptists (*e.g.*, the Mennonites) still practise baptism by pouring or sprinkling, but among those who will here be styled *modern* Baptists, the mode of administration is also distinctive, viz., immersion. The primary principle, however, is that of baptism as the basis of a Church of regenerate believers. It should also be understood that the rise of the modern Baptists, whose churches are to be found in all parts of the English-speaking world and many other countries, was wholly independent of the Anabaptist movement in any of its forms (*see* ANABAPTISTS).

1. Great Britain and Ireland.—For the beginning of the modern Baptist movement we must look abroad. Although there were doubtless many who held Baptist views scattered among the Independent communities, it was not until the time of John Smith or Smyth (d. 1612) that the modern Baptist movement in England broke away from Brownism. Smyth was appointed preacher in Lincoln in 1600 as an ordained clergyman, but became a separatist in 1605 or 1606, and, soon after, emigrated under stress of persecution with the Gainsborough Independents to Amsterdam. With Thomas Helwys (*c.* 1560–*c.* 1616) and Morton he joined the “Ancient” church there, but, coming under Mennonite teaching in 1609, he separated from the Independents, baptized himself (hence he is called the “Se-baptist”), Helwys and others probably according to the Anabaptist or Mennonite fashion of pouring. These then formed the first English Baptist Church which in 1611 published “a declaration of faith of English people remaining at Amsterdam in Holland.” The article relating to baptism is as follows:—“That every church is to receive in all their members by baptism upon the confession of their faith and sins, wrought by the preaching of the gospel according to the primitive institution and practice. And therefore churches constituted after any other manner, or of any other persons, are not according to Christ’s testament. That baptism or washing with water is the outward manifestation of dying unto sin and walking in newness of life; and therefore in no wise appertaineth to infants.” They held “that no church ought to challenge any prerogative over any other”; and that “the magistrate is not to meddle with religion, or matters of conscience nor compel men to this or that form of religion.” This is the first known expression of absolute liberty of conscience in any confession of faith.

Smyth died in Holland, but in 1612 Helwys returned to England with his church and formed the first Baptist church worshipping on English soil. The church met in Newgate street, London, and was the origin of the “General” Baptist denomination, so called because they repudiated the Calvinistic doctrine of predestination and affirmed the Arminian view of individual responsibility. The next leading event in the history of the Baptists is the rise of the first Calvinistic or Particular Baptist Church. This was the Jacob church in Southwark, which was originally Independent. A group of its members separated (the church having grown beyond what was held proper limits) and in 1633 became the first Particular Baptist Church. Thus there were now in existence in England two sets of Baptists whose origins were quite distinct and who never had any real intercourse as churches. They differed in many respects. The General Baptists were Arminian, owing to the influence of the Mennonite Anabaptists. The Particular Baptists were Calvinists, springing as they did from the Independents. But on the question of baptism both groups, while they utterly rejected the baptism of infants, were as yet unpledged to immersion and rarely practised it. The development of their doctrine as to baptism was marked along three lines of dispute: (1) who is the proper administrator of baptism? (2) who are the proper subjects? and (3) what is the proper mode? Eventually agreement was reached, and in 1644 a Confession of Faith was published in the names of the Particular Baptist churches of London, now grown to seven, “commonly (though falsely) called Anabaptist.” The article on baptism is as follows: “That baptism is an ordinance of the

New Testament given by Christ to be dispensed only upon persons professing faith, or that are disciples, or taught, who upon a confession of faith, ought to be baptized.” “The way and manner of dispensing this ordinance the Scripture holds out to be dipping or plunging the whole body under water.” They further declare (particularly in order that they may avoid the charge of being Anabaptists) that “a civil magistracy is an ordinance of God,” which they are bound to obey. They speak of the “breathing time” which they have had of late, and their hope that God would, as they say, “incline the magistrates’ hearts so far to tender our consciences as that we might be protected by them from wrong, injury, oppression and molestation”; and then they proceed: “But if God withhold the magistrates’ allowance and furtherance herein, yet we must, notwithstanding, proceed together in Christian communion, not daring to give place to suspend our practice, but to walk in obedience to Christ in the profession and holding forth this faith before mentioned, even in the midst of all trials and afflictions.” From the Restoration (1660) the meetings of nonconformists were continually disturbed and their preachers fined or imprisoned; but with the Revolution of 1688, and the passing of the Act of Toleration in 1689, the history of the persecution of Baptists as well as of other Protestant dissenters, ends. The subsequent removal of the remaining disabilities, such as those imposed by the Test and Corporation Acts repealed in 1828, has no special bearing on Baptists more than on other nonconformists.

The Baptists, having had a double origin, continued for many years in two sections—those who in accordance with Arminian views held the doctrine of “General Redemption,” and those who, agreeing with the Calvinistic theory, held the doctrine of “Particular Redemption.” In the 18th century many of the General Baptists gradually inclined to Arianism or to Socinianism in their view of Christ’s person and work; whilst, on the other hand, the Calvinism of the Particular Baptists in many of the churches became more rigid, and approached or actually became Antinomianism. In 1770 the orthodox portion of the General Baptists formed themselves into a separate association, under the name of the General Baptist New Connection, since which time the “Old Connection” has gradually merged into the Unitarian denomination. By the beginning of the 19th century the New Connection numbered 40 churches and 3,400 members. Towards the end of the 18th century many of the Particular Baptist churches became more moderate in their Calvinism, a result largely attributable to the writings of Andrew Fuller. Up to this time a great majority of the Baptists admitted none either to membership or communion who were not baptized, the principal exception being the churches in Bedfordshire and Hertfordshire, founded or influenced by Bunyan, who maintained that difference of opinion in respect to water baptism was no bar to communion. At the beginning of the 19th century this question was the occasion of great and long-continued discussion, in which the celebrated Robert Hall (1764–1831) took a principal part. The practice of mixed communion gradually spread in the denomination. Still more recently many Baptist churches have considered it right to admit to full membership persons professing faith in Christ, who do not agree with them respecting the ordinance of baptism. Such churches justify their practice on the ground that they ought to grant to all their fellow-Christians the same right of private judgment as they claim for themselves.

In 1891, largely under the influence of Dr John Clifford, a leading General Baptist, the two denominations, General and Particular, were united, there being now but one body called “The Baptist Union of Great Britain and Ireland.” This Union, however, is purely voluntary, and some Baptist churches, a few of them prosperous and powerful, hold aloof from their sister churches so far as organization is concerned. There are other Baptist bodies outside the Baptist Union beside certain isolated churches. Throughout England there are many “Strict” Baptist churches which really form a separate denomination. For the most part they are linked together according to geographical distribution in county associations. The general characteristic of the Strict Baptists is their rigorous adherence to a type of Calvinistic theology

now generally obsolete, and their insistence upon baptism as the condition of Christian communion. Their loose organization makes it impossible to obtain accurate statistics, but the number of their adherents is small.

The Baptists early felt the necessity of providing an educated ministry for their congregations. Some of their leading pastors had been educated in one or other of the English universities. Generous bequests made it possible to found an academy in Bristol for the training of young men for the ministry. In 1770 the Bristol Education Society was formed to enlarge this academy; and about the year 1811 the present Bristol Baptist college was erected. In the north of England a similar education society was formed in 1804 at Bradford, Yorkshire, which has since been removed to Rawdon, near Leeds. In London another college was formed in 1810 at Stepney; it was removed to Regent's park in 1856. The Pastors' college in connection with the Metropolitan Tabernacle was instituted in 1856, and in 1866 the present Baptist college at Manchester was instituted at Bury. Besides these, which were voluntary colleges not under denominational control, the General Baptists maintained a college from 1797, which, since the amalgamation of the two Baptist bodies, has become also a voluntary institution, though previously supported by the General Baptist Association. It is called the "Midland Baptist college," and is situated in Nottingham. There is also a Baptist theological college in Glasgow, and there are two colleges in Wales and one in Ireland. The Baptists were the first denomination of British Christians to undertake in a systematic way that work of missions to the heathen which became so prominent a feature in the religious activity of the 19th century. In 1792, the Baptist Missionary Society was formed at Kettering in Northamptonshire. The prime mover in this work was William Carey, who in the course of the following year sailed for India. The great work of Dr. Carey's life was the translation of the Bible into the various languages and dialects of India. The society's operations are now carried on, not only in the East, but in the West Indies, China, Africa (chiefly on the Congo river) and Europe. In Asia the feature of recent years is the growth of strong native missions in India and China, able to organize and carry on their own work.

In regard to church government, the Baptists agree with the Congregationalists that each separate church is complete in itself, and has, therefore, power to choose its own ministers and to make such regulations as it deems to be most in accordance with the purpose of its existence, *i.e.*, the advancement of the kingdom of Christ. The greater number of the churches are united in associations voluntarily formed, all of them determined by geographical limits. The associations, as well as the churches not in connection with them, are united together in the Baptist Union of Great Britain and Ireland referred to above. The old distinctions of "General" and "Particular" have faded away. Important financial measures are raising the standard of sustentation and superannuation, and linking the churches in closer fellowship. Much attention is given to the training of lay preachers, whose real importance had been somewhat overlooked. The problem of training and settling ministers is being viewed as a whole, and after careful thought two great changes have been adopted. There is a strong tendency to fix a term for the period of service in any one post, often five years, with the possibility of renewal. Then, to facilitate interchanges and to bring the churches into closer relations with the union, a 17th century office has been revived and modified. General superintendents work in large areas, one for the English-speaking churches in Wales, one for Scotland, one for London and eight for the rest of England. These ministers confer monthly.

2. The Continent of Europe.—During the 19th century what we have called the modern Baptist movement made its appearance in nearly every European country. In Roman Catholic countries Baptist churches were formed by missionaries coming from either England or America; work in France began in 1832, in Italy missions were started in 1866 (Spezia Mission) and in 1884 (Baptist Missionary Society, which also has a mission in Brittany) and in Spain in 1888. In Protestant countries and in Russia the Baptist movement began without missionary intervention from England or America. J. G. Oncken (1800-1884) formed the first church in

Hamburg in 1834, and thereafter Baptist churches were formed in other countries as follows: Denmark (1839), Holland and Sweden (1848), Switzerland (1849), Norway (1860), Austria and Rumania (1869), Hungary (1871) and Bulgaria (1884). Baptist churches also began to be formed in Russia and Finland in the '50s and '60s.

The troubles of Continental Baptists during the World War called forth abundant sympathy and practical help from their brethren. A conference at London in 1920 resulted in linking each national group on the Continent with one of the stronger groups elsewhere, in fostering theological seminaries within each country, and in the most promising students receiving further training in Germany, Sweden, England and America.

3. British Colonies.—In every colony the Baptists have a considerable place. There are unions of Baptist churches in the following colonies: New South Wales, Victoria, South Australia, Western Australia, Queensland, New Zealand, Tasmania, Canada (four Unions) and South Africa. The work in South Africa is assisted by the Baptist South African Missionary and Colonial Aid Society, having its seat in London.

The Baptist World Alliance was formed in 1905, when the first Baptist World Congress was held in London. Similar international congresses have been held in Berlin, Stockholm and Philadelphia; another at Toronto in 1928.

The numerical strength of the denomination is given as follows in the *Directory of the Baptist World Alliance* for 1927:—

	Churches.	Pastors and missionaries.	Members of churches.	Sunday scholars.
Europe	8,169	4,274	636,488	672,542
Asia	3,008	1,613	333,379	186,663
Africa	805	332	67,636	38,161
America:				
North	58,575	49,617	8,485,683	5,229,278
Central and West Indies	544	265	58,770	47,962
South	408	195	30,962	25,100
Australasia	429	353	32,512	43,153
	71,998	56,649	9,645,430	6,242,949

This excludes Russia, where there are many Baptists (estimated at a million or more), for whom exact returns are not at present available. As the claim has recently been made that Baptists are now the largest Protestant denomination, it may be well to state that the most recent statistics of all types of Methodism show a total of 11,798,185 communicants (Church members and probationers).

The eastern secretary of the Baptist World Alliance is Dr. J. H. Rushbrooke, to whose book, *The Baptist Movement on the Continent of Europe* (1923), reference may be made for fuller information as to that area. The standard account of the progress of Baptist life in Great Britain is Dr. W. T. Whitley's *A History of British Baptists* (1923). *A History of the Baptists in Scotland* (ed. by the Rev. Geo. Yuille) has been published (Glasgow, 1926).

Not included in the foregoing statistics are bodies such as the "Disciples of Christ" (*q.v.*), practising believers' baptism. The faith of this community is clearly and concisely given by William Robinson in *What Churches of Christ Stand For* (Birmingham, 1926). (N. H. M.)

UNITED STATES

1. Colonial Beginnings.—The first Baptist church in America was founded in the Providence settlement on Narragansett bay, by Roger Williams (*q.v.*). He had been sentenced to banishment (Oct. 1635) by the Massachusetts court because of his persistence in advocating separatistic and other unacceptable views. To escape deportation to England he betook himself (Jan. 1636) to the wilderness, where the natives gave him a tract of land for a settlement. Having been joined by a few friends from Massachusetts, Williams founded what is generally believed to be the first commonwealth in which absolute religious liberty was combined with civil democracy. He rejected the baptism of infants, and in March 1639, with 11 others, formed a church of baptized

believers. Ezekiel Holliman, who had been with him in Plymouth and shared his separatist views, first baptized Williams and then Williams baptized the rest of the company. Soon after, believing that the true ordinances and apostolic church organization had been lost in the general apostasy, Williams, though continuing on friendly terms with the Baptists of Providence, withdrew from the church and assumed the position of a Seeker.

In Nov. 1637 John Clarke (1609-1676), a physician of religious zeal and theological acumen, arrived at Boston, Massachusetts. Finding the State about to banish the Antinomian minority, including Mrs. Anne Hutchinson (*q.v.*) and her family, he assisted the fugitives in forming a colony on the island of Aquidnek, R.I., procured from the Indians through the good offices of Williams. By 1641 there were, according to John Winthrop, "professed Ana-baptists" on the island, and Clarke was probably their leader. Mark Lucar, who was baptized by immersion in London in Jan. 1642 (N.S.) and was a member of a Baptist church there, reached Newport about 1644, and formed a connecting link between early English and American Baptists.

The Providence church maintained a rather feeble existence after Williams' withdrawal. A schism occurred in 1652, with a majority contending for general redemption and for the laying on of hands as indispensable to fellowship, and a minority maintaining particular redemption and rejecting the laying on of hands as an ordinance. The surviving church, composed of the former party, became involved in Socinianism and Universalism, but exerted considerable influence at Newport, in Connecticut, New York and elsewhere. The Newport church extended its influence into Massachusetts, and in 1649 we find a group of Baptists at Rehoboth, with Obadiah Holmes as leader. The intolerance of the authorities rendered the prosecution of the work impracticable and these Massachusetts Baptists became members of the Newport church. In 1651 Baptists holding a meeting in a private house were arrested, compelled to attend the church services of the standing order, fined, imprisoned and otherwise maltreated.

Henry Dunster (1612-1659), the first president of the college at Cambridge (Harvard), had by 1653 become convinced that "visible believers only should be baptized." Being unwilling to hold his views in abeyance, he relinquished in 1654, under circumstances of considerable hardship, the work that he greatly loved. In 1663 John Myles (1621-83), a Welsh Baptist who had been one of Cromwell's Tryers, with his congregation, took refuge in Massachusetts from the intolerance of the Government of Charles II. and settled in Rehoboth, Massachusetts. Even after they were discovered to be Baptists they were allowed to remain on condition of establishing their meeting-place at a considerable distance from that of the standing order. Some time before 1665 some English Baptists had settled in the neighbourhood of Boston and several others had adopted Baptist views. These were baptized (May 1665) and joined in a church covenant with those who had been baptized in England. The church was severely persecuted, the members being frequently imprisoned and fined and denied the use of a building they had erected as a meeting-house. Long after the Act of Toleration (1689) was in full force in England, the Boston Baptists pleaded in vain for the privileges to which they were thereby entitled, and it required the most earnest efforts of English Baptists and other dissenters to gain for them a recognition of the right to exist.

In 1682 William Screven (1629-1713) and Humphrey Churchwood, members of the Boston church, gathered and organized, with the co-operation of the mother church, a small congregation at Kittery, Maine. Persecution led to migration, Screven and a few of the members making their way to South Carolina, where, with a number of English Baptists of wealth and position, what became the First Baptist church in Charleston was organized (about 1684). A few Baptists of the General (Arminian) type appeared in Virginia from 1714 onward, and were organized and fostered by missionaries from the English General Baptists. By 1727 they had invaded North Carolina, where a church was constituted later.

From 1643 onward Antipaedobaptists from New England and elsewhere had settled in the New Netherlands (New York).

Francis Doughty, an English Baptist who had spent some time in Rhode Island, laboured in this region in 1656 and baptized a number of converts. This proceeding led to his banishment. From 1711 onward Valentine Wightman (1681-1747) of Connecticut (General Baptist) made occasional missionary visits to New York at the invitation of Nicolas Eyres, a business man who had adopted Baptist views, and helped to organize a church. A number of Baptists settled on Block island about 1663. Some time before 1724 a Baptist church (probably Arminian) was formed at Oyster Bay.

The Quaker colonies, with their large measure of religious liberty, early attracted a considerable number of Baptists from New England, England and Wales. About 1684 a Baptist church was founded at Cold Spring, Bucks county, Pennsylvania. The Pennepek church was formed in 1688. Services were held in Philadelphia under the auspices of the Pennepek church from 1687 onward, but independent organization did not occur till 1698. Almost from the beginning general meetings had been held by the churches of these colonies. In 1707 the Philadelphia Association was formed as a delegated body "to consult about such things as were wanting in the churches and to set them in order" From its inception this body proved highly influential in promoting Baptist co-operation in missionary and educational work, in efforts to supply the churches with suitable ministers and to silence unworthy ones, and in maintaining sound doctrines. Sabbatarianism appeared within the bounds of the association at an early date and Seventh-day Baptist churches were formed (1705 onward).

The decades preceding the "Great Awakening" of 1740-43 were a time of religious declension. A Socinianized Arminianism had paralysed evangelistic effort. The First church, Providence, and the First church, Boston, had become Socinianized and discountenanced the revival. The First church, Newport, had been rent asunder by Arminianism, and the nominally Calvinistic remnant had itself become divided on the question of the laying on of hands. The First church, Charleston, had been wrecked by Socinianism. The General (Six Principles) Baptists of Rhode Island and Connecticut had increased their congregations and membership, and before the beginning of the 18th century had inaugurated annual associational meetings. But the fact that the Great Awakening in America was conducted on Calvinistic principles was sufficient to prevent their hearty co-operation. The churches of the Philadelphia Association were organized and engaged to some extent in missionary endeavour, but they showed little interest in the Edwards-Whitefield movement. And yet the Baptists ultimately profited by the Great Awakening beyond almost any of the denominations. In many New England communities a majority in the churches of the standing order bitterly opposed the new evangelism, and those who came under its influence felt constrained to organize "Separate" or "New Light" churches. These were severely persecuted by the dominant party and were denied even the scanty privileges that Baptists had succeeded in gaining. In several cases entire "Separate" churches transformed themselves into Baptist churches. In many cases a division of sentiment arose regarding infant baptism, but for a while mutual toleration prevailed. Mixed churches, however, had their manifest disadvantages and separation ultimately ensued.

The feeble Baptist cause in Virginia and North Carolina had been considerably strengthened by missionaries from the churches of the Philadelphia Association, and several churches, formed or reformed under their influence, united with the association. In 1776 the Ketockton Association was formed by this group of churches. The Virginia colonial Government, in earlier days cruelly intolerant, gave a limited toleration to Baptists of this type; but the "Separate" Baptists were too enthusiastic and too much alive to the evils of State control in religious matters to be willing to take out licences for their meetings, and soon came into sharp conflict with the authorities. Shubael Stearns, with about a dozen fellow-believers, settled at Sandy Creek, N.C., and in a few years had built up a church with a membership of more than 600. Marshall afterwards organized and ministered to a church at Abbott's Creek about 30m distant. From these centres "Separate" Baptist influence spread throughout North and South Caro-

lina and across the Georgia border. From North Carolina as a centre, "Separate" Baptist influence permeated Virginia and extended into Kentucky and Tennessee. The Sandy Creek Association came to embrace churches in several colonies, and Stearns, desirous of preserving the harmonious working of the churches that recognized his leadership, resisted with vehemence all proposals for the formation of other associations.

From 1760 to 1770 the growth of the "Separate" Baptist body in Virginia and the Carolinas was phenomenal. The Sandy Creek Association, with Stearns as leader, undertook to "unfellowship ordinations, ministers and churches that acted independently," and provoked such opposition that a division of the association became necessary. The General Association of Virginia and the Congaree Association of South Carolina now took their places side by side with the Sandy Creek. The Virginia "Separate" Baptists had more than doubled their numbers in the two years from May 1771 to May 1773. In 1774 some of the Virginia brethren became convinced that the apostolic office was meant to be perpetuated and induced the association to appoint an apostle. This arrangement, soon abandoned, was no doubt suggested by Methodist superintendency. In 1775 Methodist influence appeared in the contention of two of the apostles and Jeremiah Walker for universal redemption. Schism was narrowly averted by conciliatory statements on both sides. As a means of preserving harmony the Philadelphia Confession of Faith, a Calvinistic document, with provision against too rigid a construction, was adopted and a step was thus taken toward harmonizing with the "Regular" Baptists of the Philadelphia type. When the General Association was subdivided (1783), a general committee made up of delegates from each district association was constituted to consider matters that might be for the good of the whole society. Its chief work was to continue the agitation in which for some years the body had been successfully engaged in favour of religious equality and the entire separation of Church and State.

Since 1780 the "Separate" Baptists had had the hearty co-operation of the "Regular" Baptists in their struggle for religious liberty and equality. In 1787 the two bodies united and agreed to drop the names "Separate" and "Regular." The success of the Baptists of Virginia in securing step by step the abolition of everything that savoured of religious oppression, involving at last the disestablishment and the disendowment of the Episcopal Church, was due in part to the fact that Virginia Baptists were among the foremost advocates of American independence, and that they secured the co-operation of free-thinking statesmen like Thomas Jefferson and James Madison and, in most measures, that of the Presbyterians.

The Baptist cause in New England that had profited so largely from the Great Awakening failed to reap a like harvest from the War of Independence. The standing order in New England represented the patriotic and popular party. Baptists lost favour by threatening to appeal to England for a redress of their grievances at the very time when resistance to English oppression was being determined upon. Though a large proportion of the New England Baptists co-operated heartily in the cause of independence, the denomination failed to win popularity.

About 1762 the Philadelphia Association began to plan for the establishment of a Baptist institution of learning that should serve the entire denomination. Rhode Island was finally fixed upon, and James Manning (1738-91), who had just graduated from Princeton with high honours, was sent to Rhode Island (1763) to confer with leading men, Baptists and others. As a result a charter was granted by the legislature in 1764, and after a few years of preliminary work at Warren (where the first degrees ever bestowed by a Baptist institution were conferred in 1769), Providence was chosen as the home of the college (1770). Here, the institution (since 1804 known as Brown university) was for many years the only degree-conferring institution controlled by Baptists.

In 1751 the Charleston Association was formed, also on the model of the Philadelphia Association, and proved an element of denominational strength. The association raised funds for domestic missionary work (1755 onward) and for the education of

ministers (1756 onward). Brown university shared largely in the liberality of members of this highly cultivated and progressive body. The remarkable numerical progress of Baptists in South Carolina from 1787 to 1812 (from 1,620 members to 11,325) was due to the "Separate" Baptist movement under Stearns far more than to the activity of the churches of the Charleston Association. Both these types of Baptist life permeated Georgia, the latter making its influence felt in Savannah, Augusta and the more cultivated communities, the former evangelizing the masses. Many negro slaves became Baptists in Virginia, the Carolinas and Georgia. In most cases they became members of the churches of the white Baptists; but in Richmond, Savannah and some other towns they were encouraged to have churches of their own. By 1812 there were in the United States 173,972 Baptist Church members, the denominational numerical strength having considerably more than doubled since the beginning of the 19th century.

2. Middle Period.—From the beginning of the 19th century the Baptists in the United States developed rapidly and organized themselves more completely. Theological seminaries were founded: Colgate university at Hamilton, N.Y., in 1819; Newton Theological institution at Newton Centre, Mass., in 1825; Rochester Theological seminary at Rochester, N.Y., in 1850; Southern Baptist Theological seminary at Louisville, Ky., in 1859; Baptist Union Theological seminary at Morgan Park, Ill., in 1866; Crozer Theological seminary at Chester, Pa., in 1867; Kansas City Baptist Theological seminary, in 1901; the Berkeley Baptist Divinity school, Berkeley, Calif., 1904; South-western Baptist Theological seminary, Fort Worth, Texas, 1908; Northern Baptist Theological seminary, Chicago, Ill., 1913; and Eastern Baptist Theological seminary, 1925. The ministry thus became increasingly educated. In 1928 the denomination maintained over 100 theological universities and colleges.

State conventions were organized throughout the States, as a means of co-operation in the support of feeble churches and the extension of home missionary activity. A number of journals were also founded. After Adoniram Judson and Luther Rice, who had gone as missionaries to India under the auspices of the American Board of Foreign Missions, became Baptists *en route* there was organized in 1813 the Baptist Society for Propagating the Gospel in India and other Foreign Parts. In 1832 the American Baptist Home Mission Society was organized for work on the American continents. In 1824 was organized the Baptist General Tract Society which, in 1840, became the American Baptist Publication Society. The struggle of the United States over slavery resulted in a division within the Baptist ranks and the southern Baptists withdrew to organize the Southern Baptist Convention, with a foreign mission board, a home mission board and a Sunday school board. This separation has never been overcome, although in 1891 the Baptist Young People's Union of America somewhat united Baptist interests, and the Baptist World Alliance has also given a new sense of unity to the American Baptists as well as to those of the rest of the world.

3. Modern Period.—The Baptists of America were in 1927 organized in 14 national, or approximately national, bodies. Of these, the Northern Baptist Convention had a membership of 1,399,931; the Southern Baptist Convention 3,708,253, and various negro conventions 3,253,369. After allowance has been made for duplications, the total membership of the Baptist churches in the United States was 8,347,331. The total value in 1927 of church property of American Baptists was \$426,416,000, and the amount raised for missions and various other beneficences was \$14,541,116, with total annual contributions of \$76,031,654. These large figures indicate a rapid development.

The Southern Baptist Convention is vigorously expressing itself in various forms of denominational activity in the South. Southern Baptists have declined to enter the Federal Council of the Churches of Christ in America. The Southern Baptist Convention is organized somewhat differently from the Northern, having boards rather than societies. A large number of Southern Baptist churches are in rural districts. Theologically, the Southern Baptists are conservative and especially insistent upon immersion as the mode of baptism. Their development in wealth and prestige,

especially noteworthy in Texas, is attested by their support of two large theological seminaries, two training-schools, 31 colleges and 34 junior colleges. They have established many hospitals and maintain a number of orphanages. They are making, especially through the faculty of the Southern Baptist Theological seminary at Louisville, distinguished contributions to theological scholarship.

The Northern Baptist Convention. Prior to 1907 the Baptist churches of the northern States had no central body to which

THE BAPTIST RIVERSIDE BUILDING IN NEW YORK CITY. ONE OF THE LARGEST CHURCH BUILDINGS IN THE UNITED STATES. OWES ITS MAJOR ARCHITECTURAL FEATURE TO CHARTRES CATHEDRAL

they could send delegates. There existed a number of societies engaged in foreign and home missions and publication, but these were not strictly representative bodies. In 1907 there was a tentative organization of a Northern Baptist Convention which was subsequently developed into a permanent body, composed of delegates from local churches and 37 affiliating organizations, including State conventions. This body has no authority, but has very great influence. In 1927 the Northern Baptists had in the foreign field 794 missionaries; 2,249 churches with 9,615 native workers; 3,818 schools of all grades, with 143,500 pupils; and 115 hospitals and dispensaries. The Northern Baptists maintained 14 seminaries of different grades, two training-schools, 24 universities and colleges, four junior colleges and 16 academies. They furnish many leaders in theological thinking and scholarship. The Board of Education aids various colleges and seminaries as well as supporting student pastors at state universities.

For several years the denomination suffered considerable inner disturbance because of the efforts of certain conservative elements in the denomination to get control of the convention and adopt a confession or creed for the churches. This move was so thoroughly opposed to the Baptist policy that it was rejected overwhelmingly. By 1928 this agitation had largely passed within the Northern Convention, although it has been continued by members of the Canadian and Southern as well as of the Northern Baptist Convention, who have founded the Baptist Bible Union for the purpose of maintaining what seems to them to be fundamental Baptist positions as opposed to more liberal tendencies.

The Negro Baptists have organized a number of national, or semi-national bodies, the two largest of which are the National Baptist Convention and the National Baptist Convention of America. These bodies maintain various missionary and publication societies with admirable buildings; they are well organized and efficiently led. They maintain two theological seminaries, 15 colleges and 13 junior colleges and are active in educating the youth of their churches.

Foreign-speaking Baptists. For a number of years work has been carried on by Baptists among foreign-speaking immigrants in the United States, and these efforts have resulted in the establishment of a number of Baptist conventions and other organizations in the various nationalities. The largest of these bodies are the German and Swedish Conventions, which represent a total membership of something like 65,000. In addition smaller bodies of Danish, Norwegian, Czechoslovak, Polish, Hungarian, Finnish, Italian, French, Portuguese, Rumanian and Russian bodies have been organized. There are also a large number of unorganized, foreign-speaking Baptists. The entire membership of all the foreign-speaking Baptist bodies, so far as is known, is approximately 83,000. These foreign-speaking groups have been of great value in the process of "Americanization," for the second generation either speaks English or joins English-speaking churches.

BAR, COUNTS AND DUKES OF In the middle of the 10th century the territory of Bar (Barrois) formed a dependency of the Empire. In the 11th century its lords were only counts by title; they belonged to the house of Mousson (which also possessed the countship of Montbéliard and Ferrette), and usually fought in the French ranks, while their neighbours, the dukes of Lorraine, adhered to the German side. Theobald I, count of Bar, was an ally of Philip Augustus, as was also his son Henry II, who distinguished himself at the Battle of Bouvines in 1214. But sometimes the counts of Bar bore arms against France. In 1301 Henry III. having made an alliance with Edward I of England, whose daughter he had married, was vanquished by Philip the Fair, who forced him to do homage for a part of Barrois, situated west of the Meuse, which was called *Barrois mouvant*. In 1354 Robert, count of Bar, who had married the daughter of King John, was made marquis of Pont-à-Mousson by the emperor Charles IV. and took the title of duke of Bar. His successor, Edward III., was killed at Agincourt in 1415. In 1419 Louis of Bar, brother of the last-named, a cardinal and bishop of Châlons, gave the duchy of Bar to René of Anjou, the grandson of his sister Yolande, who married Isabella, duchess of Lorraine. Yolande of Anjou, who in 1444, had married Ferri of Lorraine, count of Vaudémont, became heiress of Nicholas of Anjou, duke of Calabria and of Lorraine, in 1473, and of René of Anjou, duke of Bar, in 1480; thus Lorraine, with Barrois added to it, once more returned to the family of its ancient dukes. United with Lorraine to France in 1634, Barrois remained, except for short intervals, part of the royal domain. It was granted in 1738 to Stanislaus Leszczyński, ex-king of Poland, and on his death in 1766 was once more attached to the crown of France. (M. P.)

BAR, FRANÇOIS DE (1538–1606), French scholar, was born at Seizencourt, near St. Quentin, and became prior of the Benedictine abbey of Anchin, near Pecquencourt, and passed much of his time in the valuable library of the abbey, studying ecclesiastical history, especially that of Flanders. He also made a catalogue of the manuscripts at Anchin and annotated many of them. During the French Revolution his manuscripts passed to the library at Douai. Bar died at Anchin, March 25 1606.

See J. Lelong, *Bibliothèque historique de la France* (Paris, 1768–78); C. C. A. Dehaisnes, "Catalogue des manuscrits de Douai," in the *Catalogue général des bibliothèques des départements*, t. vi. (Paris, 1849–85).

BAR, a town in the Ukrainian S.S.R. on a tributary of the Bug. Lat. 49° 5' N, long. 27° 38' E. Pop. (1926) 9,431. It was rebuilt by Sigismund I. of Poland after its destruction by the Tatars in 1452 and renamed Bar (formerly Rov) by his wife Bona Sforza, born in Bari, Italy. It was captured by the Turks in 1672, but re-taken 1699. In 1768 it became the headquarters of the famous anti-Russian Bar confederation of the Polish aristocracy; but it was finally united to Russia in 1793.

BAR, CONFEDERATION OF, a famous confederation of the Polish nobles and gentry formed at the little fortress of Bar in Podolia in 1768 to defend the internal and external independence of Poland against the aggressions of the Russian Government as represented by her representative at Warsaw, Prince Nicholas Repnin. The originators of this confederation were Adam Krasinski, bishop of Kamenets, Osip Pulawski and Michael Krasinski. The confederates, being attacked by the king, Stanislaus, appealed for help abroad and contributed to bring about a war between Russia and Turkey. Their bands under Ignaty Malchewsky, Michael Pac and Prince Charles Radziwill ravaged the land in every direction, won several engagements with the Russians, and at last, utterly ignoring the king, sent envoys on their own account to the principal European powers.

In 1770 the council of the confederation was transferred from its original seat in Silesia to Hungary, from whence it conducted diplomatic negotiations with France, Austria and Turkey with the view to forming a league against Russia. The court of Versailles sent Dumouriez to act as commander-in-chief of the confederates, and their army, thoroughly reorganized by him, gallantly maintained the hopeless struggle for some years. It was not till 1776 that the last traces of it disappeared.

See Alexander Kraushar, *Prince Repnin in Poland* (Pol.), (Warsaw, 1900); F. A. Thesby de Belcour, *The Confederates of Bar* (Pol.) (Cracow, 1895); Charles François Dumouriez, *Mémoires et correspondance* (Paris, 1834).

BAR, THE. This term, as equivalent to the profession of barrister (*q.v.*), originated in the partition or bar dividing the English law-courts into two parts, for the purpose of separating the members and officials of the court from the prisoners or suitors, their advocates and the general public. Theoretically, this division of the court is still maintained in England, those who are entitled to sit within the bar including king's counsel, barristers with patents of precedence, serjeants (till the order died out) and solicitors, while the other members of the bar and the general public remain without. Parties in civil suits who appear in person are allowed to stand on the floor within the bar instead of, as formerly, appearing at the bar itself. In criminal trials the accused still stands forward at the bar. The exclusive privilege of calling to the bar belongs to the Masters of the Bench of each Inn of Court (*q.v.*), who also exercise disciplinary power over their members; but it was widely felt by members of the bar in recent years that the benchers did not keep a sufficiently watchful eye on the conduct of the members. Consequently, in 1883, a bar committee was formed for the purpose of dealing with all matters relating to the profession, such as the criticizing of proposed legal reforms, and the expression of opinions on matters of professional etiquette, conduct and practice. In 1894 the committee was dissolved, and succeeded by the general council of the bar, elected on a somewhat wider basis. It is composed of a due proportion of king's counsel and outer barristers elected by voting-papers sent to all barristers having an address in the *Law List* within the United Kingdom. Its expenses are paid by contributions from the four Inns of Court. Its powers are not disciplinary, but it would draw the attention of the benchers to any gross violation of professional etiquette.

Each state in America has its own bar, consisting of all attorneys-at-law residing within it who have been admitted to practise in its courts. Generally attorneys are admitted in one court to practise in all courts. An attorney of a state cannot practise in a court of the United States unless he has been admitted to it, or to one of the same class in another district or circuit. He cannot appear in the Supreme Court of the United States unless specially admitted and sworn as an attorney of that court, which is done on motion in case of any one who has practised for three years in the highest courts of his state and is in good standing at its bar. In most of the states there is a state bar association, and in some cities and counties local bar associations. These consist of such members of its bar as desire thus to associate, the object being to guard and advance the standards of the profession. Some own valuable libraries. These associations have no official recognition, but their influence is considerable in recommending and

shaping legislation respecting the judicial establishment and procedure. They also serve a useful purpose in instituting or promoting proceedings to discipline or expel unworthy attorneys from the bar. There is an American Bar Association, founded in 1878, composed of over 3,500 members of different states of like character and position. Some of these associations publish annually a volume of transactions. The rights, duties and liabilities of counsellors-at-law are stated under ATTORNEY. As members of the bar of the state in which they practise they are subject to its laws regulating such practice; *e.g.*, in some states they are forbidden to advertise for divorce cases (New York Penal Code [1902] 148a) (1905, *People v. Taylor* [Colorado], 75 Pac. Rep. 914). It is common throughout the United States for lawyers to make contracts for "contingent fees," *i.e.*, for a percentage of the amount recovered. Such contracts are not champertous and are upheld by the courts, but will be set aside if an unconscionable bargain be made with the client (*Deering v. Scheyer* [N.Y.], 58 App. D. 322). So also by the U.S. Supreme Court (*Wright v. Tebbets*, 91 U.S. 252; *Taylor v. Benis*, 110 U.S. 42). The reason for upholding such contracts is that otherwise poor persons would often fail of securing or protecting their property or rights. In fact such contracts are seldom set aside, though no doubt the practice is capable of abuse.

BAR, in physical geography, an underwater ridge of sand or silt crossing a river or harbour. It may be raised by wave action above sea-level. When a river enters a tidal sea its rate of flow is checked, and the material it carries in suspension is deposited in a shifting bar lying athwart the channel. Where the channel is only partly closed, and the bar is attached to the land on one side, the feature is called a spit ("Nehrung," in the Baltic area). A bar may be produced by tidal action alone in an estuary or narrow gulf (as at Port Adelaide) where the tides sweep the loose sand backward and forward, depositing it where the motion of the water is checked. Nahant Bay (Mass.) is bordered by a ridge which separates it from Lynn harbour, and ties Nahant settlement to the mainland; the bar has been formed in the above manner.

Bar in music, meant originally one of the short vertical lines which divide the stave at regular intervals and in this way mark off the several measures of a composition, but in modern usage it has come to mean the measures themselves and is always used in this sense, the vertical dividing lines being now known as bar-lines. Bars serve not only to divide up a composition into convenient short sections which facilitate its performance but also to indicate its metre, the strongest accent falling always (unless intentionally and temporarily displaced) on the first beat of the bar, and the division is clearly marked.

The term *bar* is also used in meteorology (*q.v.*). Here it denotes the dynamical unit of atmospheric pressure. (See BAROMETER: *Units of Measurement of Pressure.*)

BARA BANKI, a town and district of British India, in the Fyzabad division of the United Provinces. The town, which forms one municipality with Nawabgani, the administrative headquarters of the district, trades in sugar and cotton.

The district has an area of 1,758 sq.m., level plain interspersed with numerous *jhils* or marshes. In the upper part the soil is sandy, while in the lower part it is clayey and produces finer crops. The principal rivers are the Gogra, forming the northern boundary, and the Gumti, flowing through the middle of the district. In 1856 it came, with the rest of Oudh, under British rule. During the Sepoy war of 1857-58 the whole of the Bara Banki talukdars joined the mutineers, but offered no serious resistance after the capture of Lucknow. In 1921 the population was 1,029,954. The chief crops are rice, wheat, pulse and other food-grains and sugar-cane.

BARABOO, a city of Wisconsin, U.S.A., on the Baraboo river, Federal highway 12, and the Chicago and North Western railroad, about 35m. N.W. of Madison; the county-seat of Sauk county. The population was 6,324 in 1910; 5,538 in 1920. This decrease was caused by the removal of the railway shops to a more convenient point on completion of a new short cut on the Chicago and North Western in 1915.

Baraboo is built on a series of hills and bluffs about 1,000 ft. above sea-level, and is a centre for summer tourists. Devil's lake, in the largest of Wisconsin's State parks, is three miles to the south; Mirror lake a few miles to the north-west and the lower dells of the Wisconsin river, noted for their weird beauty, are near Kilbourn, 12 m. N. Woollen goods, towels, rugs, refrigerator-cars and barn equipment are manufactured in the city, with power from hydro-electric development of the Wisconsin river.

The city, first settled in 1839 and chartered in 1882, was named after Jean Baribault, an early French trapper. The Ringling circus had its winter quarters here before its consolidation with the Barnum and Bailey company in 1918.

BARABRA, the modern inhabitants of Nubia. The work of the archaeological survey of Nubia indicates that even before the dawn of Egyptian history lower Nubia was inhabited by a proto-Egyptian race, the near relatives of the pre-dynastic Egyptians whose wares they imported. By the 12th dynasty the population was heavily loaded with negro blood, and the recent discoveries at Kerma seem to carry this population south to the neighbourhood of the third cataract. Thus, apart from local fluctuations of minor importance, the population of Nubia from the 18th dynasty onwards may well have remained substantially unchanged, and the negro language now spoken by the Barabra may go back to this or an even earlier period. But although the Barabra speak a negro language, they must be regarded as predominantly Hamitic in blood and culture, and individuals of a physical type recalling that of the proto-Egyptians are not uncommon even now.

Physical Characteristics.—The Barabra are of medium height (about 66½ in.), for the most part long-headed, often of a slight, rather graceful build, which immediately distinguishes them from the Fellahin. The "finest" type, that in which there is least evidence of negro blood, is of medium or dark bronze colour, with regular features and more or less oval face. The hair is black and almost straight, wavy, or curly, but seldom tightly curled like that of a negro. The eyes are dark, often large and handsome; the nose is well formed, though generally short.

Tribal Divisions.—The Barabra are divided into a number of tribes, and although they have adopted the Arab organization the names of a number of their sections indicate affinities with the eastern desert, if not actual Beja (*q.v.*) origin. The following are the tribal units generally recognized: (1) the Kenuz, who often speak of themselves as Nubi, between Aswan and Korosko; (2) the Feyadicha, this being really a nickname; (3) the Mahas, stretching from Wady Halfa to near Dongola; (4) the Danagla, near Dongola.

Mode of Life.—The Barabra are agricultural, where their country is wide enough to permit of any considerable cultivation, and even where the desert closes in on the river they take advantage of every strip which at low Nile is left covered with alluvium. But even with the greatest industry the country does not produce enough grain to maintain its population, and a considerable proportion of its male inhabitants seek their livelihood elsewhere, for they are enterprising, great travellers and traders, and quick at picking up new languages. They are to be found as servants everywhere between the delta and Khartum, and provided a considerable number of the Arab slave-raiders in the middle of last century, while for the last hundred years or more they have been exerting a steady and increasing influence in Kordofan. This is specially true of the Danagla. Most of the men are bilingual, speaking Arabic as well as their own languages, of which there are four (according to some three) recognized dialects. The women do not usually accompany the men on their travels, the result being that few know even a word or two of Arabic. They scar their cheeks with vertical or oblique cuts on each side of the face; they circumcize their boys and infibulate their girls, as indeed do all the Hamitic and almost all Arab tribes of the Sudan. Their houses are of the ordinary rectangular Arab form. Although the women now wear the Arab robe, about 50 years ago their customary garment was a short petticoat reaching to the knee.

(C. G. S.)

BARACALDO, a river-port of north-eastern Spain, in the province of Biscay, 5 m. by rail N.W. of Bilbao. Pop. (1920),

26,906. The municipality of Baracaldo comprises a number of villages spread over the fertile flats—covered with maize, pod fruit and vines—at the confluence of the rivers Cadagua and Galindo with the Nervión. The industrialization of the district by the establishment of iron and steel works on the banks of these rivers has led to the very rapid increase of population in the last half-century; this is characteristic of the Biscayan metallurgical area.

BARACOA, a seaport city of north-east Cuba, in Oriente province. Pop. (1919) 5,205. The town lies under high hills on a small circular harbour accessible to small craft. The country round about is extremely rugged. The hill called the "Anvil of Baracoa" (about 3,000 ft.) is remarkable for its extremely regular formation. It completely dominates the city's background, and is a well-known bearing for navigators. The town is the trading centre of a large plantation region behind it and is the centre of the banana and coco-nut export trade. There is a fort dating from the middle of the 18th century. Baracoa is the oldest town in Cuba, having been settled by Diego Velázquez in 1512.

BARAHONA DE SOTO, LUIS (1535?–1595), Spanish poet, was born about 1535 at Lucena (Cordova), was educated at Granada, and practised as a physician at Cordova. His principal poem is the *Primera parte de la Angélica* (1586), a continuation of the *Orlando furioso*; the second part was long believed to be lost, but fragments of it have been identified in the anonymous *Diálogos de la montería*, first printed in 1890; the *Diálogos* also embody fragments of a poem by Barahona entitled *Los Principios del mundo*, and many graceful lyrics by the same writer have been published by Francisco Rodríguez Marín. Cervantes describes Barahona as "one of the best poets not only in Spain, but in the whole world"; this is friendly hyperbole. Nevertheless Barahona has high merits: poetic imagination, ingenious fancy, and an exceptional mastery of the methods transplanted to Spain from Italy. His *Angélica* has been reproduced in facsimile (New York, 1904) by Archer M. Huntington.

See F. Rodríguez Marín, *Luis Barahona de Soto, estudio biográfico, bibliográfico, y crítico* (1903); *Diálogos de la montería*, edited by F. R. de Ujagón (1890). (J. F.-K.)

BARAITA: see TALMUD.

BARAKA, a term used among the Berbers (*q.v.*) to indicate the quality of "holiness" of people and things. The word is Semitic and primarily meant knee but now means "blessing." It is not derived from or connected with *baraq*, lightning. A person possessing *baraka* in an exceptional degree is called by a term conveniently translated "saint." No one possessed so much *baraka* as the Prophet, and the transmission of a portion of his *baraka* to his descendants through his daughter Fatimah accounts for the veneration paid to every *sherif*, of whom there are immense numbers in Morocco, the majority no doubt with no real genealogical claim to the title. But apart from descent high office produces, or perhaps more fairly is a sign of, *baraka*; thus the Sultan of Morocco possesses both the *baraka* which is inherent in him as head of the 'Alawiim family, and that of the sultanhip, he being the vice-regent of God on earth:

"It is on the Sultan's *baraka* that the welfare of the whole country depends. When it is strong and unpolluted the crops are abundant, the women give birth to good children, and the country is prosperous in every respect; in the summer of 1908 the natives of Tangier attributed the exceptionally good sardine fishery to Mûlâi Hâfid's accession to the throne. On the other hand, in the reign of his predecessor the deterioration or loss of the Sultan's *baraka* showed itself in disturbances and troubles, in drought and famine, and in the fruit falling down from the trees before it was ripe. Nay even in those parts of Morocco which are not subject to the Sultan's worldly rule the people believe that their welfare, and especially the crops, are dependent on his *baraka*. . . Besides the shereefs there are other families whose members are possessed of *baraka* as a hereditary quality, namely the families of *mrâbîn* (sing. *mrâbât*. . .). These families consist of the descendants of some saintly ancestor who was not a shereef and whose *baraka* was in some degree transmitted to them."

These "marabout" (the French form—which also denotes the shrines of holy men) are the everyday saints and miracle workers

of north Africa, who so often have given a religious sanction to the anti-European activities of the tribes, while in peaceful times the less distinguished instruct the young, call to prayer, and generally preside over religious functions. The village *Imam* commonly receives a salary for his services besides claiming presents in kind from all who can afford them.

But *baraka* is naturally communicated to the tomb of a saint and the objects associated with it; it is inherent in corn—especially seed corn—bread, trees, especially palms and olives, wells, springs, stones, rocks, caves, sometimes animals or birds (not necessarily those to which medicinal virtues are ascribed), such as the swallow, while of all animal products milk stands pre-eminent as full of *baraka* (in this connection it is worth noting that in Africa while most nomad Arabs will give a traveller milk few will sell it). Finally it must always be remembered, for offence is easy, that *baraka* is extremely sensitive to pollution, and is spoilt, e.g., by contact with infidels. One reason why the sultan Mulāi 'Abdul Aziz lost his *baraka* was the presence of Christians at his court, while the barbers of Andjra say that there is no *baraka* in the razors used by their colleagues in Tangiers because they are sharpened by Christians. A prayer said in a Christian's house or in the house or garden of a Jew is of no avail. A scribe from the Rif told Westermarck that in order to retain his *baraka* a pilgrim must not go to the market and expose himself to the looks of the Jews who are gathered there. So too Jews are not allowed to come near the place in the market where the Muslims sell their grain, they must not appear on a threshing-floor, enter a granary, nor even approach a beehive, lest *baraka* be lost.

See E. Westermarck, *Ritual and Belief in Morocco*.

BARANTE, AMABLE GUILLAUME PROSPER BRUGIERE, BARON DE (1782–1866), French statesman and historian, the son of an advocate, was born at Riom on June 10, 1782. He held numerous important administrative posts under the first Empire and under the restoration. After the revolution of 1830 he was ambassador at Turin and at St. Petersburg (Leningrad). After the fall of the monarchy in 1848 he retired into private life. He died on Nov. 22, 1866. Barante's *Histoire des ducs de Bourgogne de la maison de Valois* (1824–28) procured him immediate admission to the French Academy. Its narrative qualities, and purity of style, won high praise from the romantic school. His works include: a French translation of the dramatic works of Schiller; *Questions constitutionnelles* (1850); *Histoire de la Convention Nationale* (1851–53); *Histoire du Directoire de la République française* (1855).

His *Souvenirs* was published by his grandson (1890–99). See also the article by Guizot in the *Revue des deux Mondes*, July 1867.

BÁRÁNY, ROBERT (1876–), Austrian physician, was born in Vienna, April 22, 1876, and became a lecturer on diseases of the ear at the university there in 1909. In 1915, when he was a military doctor at Przmysl, he was taken prisoner by the Russians, but after some time he was released as an invalid. In 1917 he was invited to Uppsala University as assistant professor for ear and throat diseases and thus gained the title of professor. In 1914 he won the Nobel Prize for medicine, for his investigations in physiology and the methods of diagnosis, of great significance in the development of internal surgery. Bárány also carried out important investigations in the physiology and pathology of the cerebellum and worked out a method for the objective diagnosis of one-sided deafness. His works include *Physiologie und Pathologie des Bogengang—Apparats beim Menschen* (1907).

BARASAT, a subdivisional town in the district of the Twenty-four Parganas, Bengal, India.

BARATHRUM, in Greek *βάραθρον*, a pit, at Athens the deep cleft west of the Hill of the Nymphs, into which common criminals were thrown. (See ATHENS.)

BARATYNSKI, YEVGENIY ABRAMOVICH (1800–1844), Russian poet. He served for eight years in the army in Finland, where he composed his first poem, *Eda*. In 1827 he settled near Moscow. There he completed his chief work, *The Gipsy*, a poem written in the melancholy and romantic style then the mode among the Russian admirers of Byron. He died in 1844

at Naples. On the journey to Naples he wrote one of his finest poems, *The Steamboat*.

A collected edition of his poems appeared at St. Petersburg (1835); later editions, Moscow (1869), and Kazan (1884).

BARB. (1) A term used of the folds of mucous membrane under the tongue of horses and cattle, and of a disease affecting that part, of the wattles round the mouth of the barbel, of the backward turned points of an arrow and of the piece of folded linen worn over the neck by nuns (Lat. *barba*, a beard). (2) A name applied to a breed of horses imported into Spain from Barbary (Fr. *barbe*, meaning "from Barbary") and to a breed of pigeons.

BARBACENA, an inland town of Brazil, in the State of Minas Geraes, 150m. N.N.W. of Rio de Janeiro and about 3,500ft. above sea-level. The surrounding district is chiefly agricultural, producing coffee, sugar-cane, Indian corn and cattle, and the town has considerable commercial importance. It is also noted for its healthy climate and possesses a large sanatorium much frequented by convalescents from Rio de Janeiro during the hot season. Barbacena was formerly an important distributing centre for the mining districts of Minas Geraes before the railway was extended beyond that point.

BARBACOAN, a linguistic stock or sub-stock of South American Indians, so called from the Barbacoas, one of its most important tribes. The stock, which included among other tribes the Cayapas (*q.v.*) and Colorados, occupied the coastal region of southern Colombia and northern Ecuador, from about 3° N. Lat. south to the mouth of the Esmeraldas river. Beyond this the coast was held by Esmeraldan (*q.v.*) tribes, but peoples belonging to the Barbacoan stock extended in the interior as far south as the headwaters of the Daule river. The name Barbacoa is derived from the term applied by the Spanish to the peculiar type of large communal houses, built on high piles, in use by the tribes of this stock. Recent studies have shown that there is considerable reason to believe that the Barbacoan languages are fundamentally related to the Chibchan (*q.v.*). If this is confirmed, the group would then lose its status as an independent linguistic stock.

See F. G. Suarez, *Prehistoria Ecuatoriana* (Quito, 1904); H. Beuchat and P. Rivet, *Affinités des langues du sud de la Colombie et du nord de l'Equateur* (Museum, 1910, vol. xi.); P. Rivet, "Les Indiens Colorados" (*Journ. Soc. Americanistes de Paris* [n.s.], vol. ii. pp. 177–208).

BARBADOS or BARBADOES, an island in the British West Indies. It lies 78m. E. of St. Vincent, in 13° 4' N. and 59° 37' W., is 21m. long, 14½m. at its broadest and 166sq.m. (106,470-ac.) in extent (roughly equalling the Isle of Wight). Its coasts are encircled with coral reefs, extending in some places three miles seaward. The island is elevated, with Mt. Hillaby (1,100ft.) near the centre, from which the land falls gently on all sides to the sea. The only natural harbour is Carlisle bay on the south-western coast, little better than a shallow roadstead, only accessible to light draught vessels.

Geology.—The oldest rocks, the Scotland series, are of shallow water origin, coarse grits, brown sandstones and sandy clays, in places saturated with petroleum and traversed by veins of manjak (glance-pitch). They have been folded and denuded, and form the foundation on which rest the later beds of the island. Upon the denuded edges of the Scotland beds lies the Oceanic series, chalky limestones, siliceous earths, red clay, and, at the top, a layer of mudstone composed mainly of volcanic dust. The limestones contain Globigerina and other Foraminifera, the siliceous beds are made of Radiolaria, sponge spicules and diatoms, while the red clay closely resembles that of the deepest parts of the oceans. The whole series was laid down in deep water. The Oceanic series is generally overlaid directly, and unconformably, by coral limestones which lie indifferently upon the older beds. Although of no great thickness, they cover six-sevenths of the island, rising in a series of terraces to a height of nearly 1,100ft. The Scotland series probably belongs to the Tertiary system, but the want of characteristic fossils makes determination difficult. Sandstone, and clays suitable for brick-making, are found in the district of Scotland, so called from a fancied resemblance to the Highlands of Scotland. The only other mineral product is manjak, which is a

species of asphalt, also found in this district and to some extent exported.

Climate.—The climate of Barbados is pleasant. The seasons are divided into wet and dry, the latter (extending from December to the end of May) being also the cold season. The temperature ranges from 70° to 86°, rarely, even on the coldest days, falling below 65°. The average annual rainfall is about 60in., September being the wettest month. For eight months the invigorating north-east trade winds temper the tropical heat. The absence of swamps, the porous nature of the soil, and the extent of cultivation account for the freedom of the island from malaria. The climate is beneficial for pulmonary diseases, especially in their earlier stages, and is remarkable in arresting the decay of vital power consequent upon old age. Leprosy occurs amongst the negroes, and elephantiasis is so frequent as to be known as "Barbados leg."

Industries.—Cultivation of sugar was introduced in the middle of the 17th century, and cheapness of labour, extreme fertility of the soil and care bestowed on cultivation made it the staple product of the island. Cotton growing has recently become of importance. The few other industries include rum distilleries and factories for chemicals, ice and tobacco. A railway 28m. long runs from Bridgetown partly round the coast. The island is a place of call for almost all the steamships plying to and from the West Indies, and is a great centre of distribution. There is direct communication with Great Britain, the United States, Canada and the other West Indian islands.

Population and Administration.—The island is also the see of a bishop, who, with the clergy of all denominations, is paid by the Government. Codrington college, founded by Col. Christopher Codrington, who in 1710 bequeathed two estates to the Society for the Propagation of the Gospel, trains young men for holy orders and is affiliated to the University of Durham. Harrison college and The Lodge are secondary schools for boys, Queen's college for girls. There are several second grade and a large number of primary schools. The colony has an elected House of Assembly and a nominated legislative council. The Crown has a veto on legislation and the Colonial Office appoints the public officials, except the treasurer. Barbados was till 1922 the headquarters of the Imperial Agricultural Department of the West Indies, now amalgamated with the Imperial College of Tropical Agriculture (see TRINIDAD), to which the island owes the development of cotton growing, etc. The majority of the population consists of negroes, passionately attached to the island, who have a well-marked physiognomy and dialect of their own. They outnumber the whites by nine to one. Barbados is densely populated. In 1926 the population was (estimated) 169,385, or 1,021 to the square mile. There are no Crown lands or forests.

Towns.—Bridgetown (pop. 16,648), the capital, situated on the south-west coast, is a pretty town on the lower spurs of easy hills. The cathedral, St. Michael's, serves as a parish church. Trafalgar square has the earliest monument to Nelson. There are many good buildings, shops and gardens, a handsome military parade ground and fine beaches. Fontabelle and Hastings are popular suburban watering-places with good sea-bathing. Speights-town is the only other town of any size.

HISTORY

The name of the island may be derived from the Spanish word for the hanging branches of a vine which strike root in the ground, or alternatively from a species of bearded fig-tree. In the 16th-century maps the name is variously rendered St. Bernardo, Bernados, Barbudoso, Barnodos and Barnodo. There are more numerous traces of the Carib Indians here than in any other of the Antilles. Barbados is thought to have been first visited by the Portuguese. Its history illustrates the process of peaceful colonization, for the island, acquired without conquest, has never been out of the possession of the British. It was touched in 1605 by the British ship "Olive Blossom," whose crew took possession in the name of James I.; but the first settlement was made in 1625, at the direction of Sir William Courteen under the patent of Lord Leigh, afterwards Earl of Marlborough, to

whom the island had been granted by the king. Two years later a grant of the island was obtained by the Earl of Carlisle, whose claim was based on a grant, from the king, of all the Caribbean islands in 1624; and in 1628 Charles Wolfestone, a native of Bermuda, was appointed governor. In the same year 64 settlers arrived at Carlisle Bay and the present capital was founded. During the Civil War in England many Royalists sought refuge in Barbados, where, under Lord Willoughby (who had leased the island from the Earl of Carlisle), they offered stout resistance to the forces of the Commonwealth. Willoughby, however, was ultimately defeated and exiled. After the Restoration, to appease the planters, doubtful of their title to their valuable estates, the proprietary or patent interest was abolished, and the Crown took over the government of the island; a duty of 4½% on all exports being imposed to satisfy the claims of the patentees. In 1684, under the governorship of Sir Richard Dutton, a census was taken, according to which the population then consisted of 20,000 whites and 46,000 slaves. The European wars of the 18th century caused much suffering, as the West Indies were the scene of numerous battles between the British and the French. In the course of the American War of Independence Barbados again experienced great hardships owing to the restrictions placed upon the importation of provisions from the American colonies. For three years after the peace of Amiens in 1802 the colony enjoyed uninterrupted calm, but in 1805 it was only saved from falling into the hands of the French by the timely arrival of Admiral Cochrane. Since that date it has remained unthreatened in the possession of the British. The rupture between Great Britain and the United States in 1812 caused privateering to be resumed, the trade of the colony being thereby almost destroyed. This led to an agitation for the repeal of the 4½% duty, but it was not till 1838 that the efforts to secure this were successful. On the abolition of slavery in 1834 the slaves continued to work for their masters as hired servants, and a period of great prosperity succeeded. The proposed confederation of the Windward Islands in 1876, however, provoked riots, which occasioned considerable loss of life and property, but secured for the people their existence as a separate colony. Hurricanes are the scourge of Barbados, those of 1780, 1831, and 1898 being so disastrous as to necessitate relief measures by the home government.

Hist. of W. Indies* (1827); Schomburgk, *History of Barbados* (1848); N. D. Davis, *The Cavaliers and Roundheads of Barbados* (1887); A. Macmillan, *The Red Book of the West Indies* (1922); vol. "British America" in *Nations of Today*, edited by John Buchan (1923).

BARBARA, SAINT, a virgin martyr and saint of the Roman Catholic and Orthodox Eastern Churches, whose festival day is December 4. She was the daughter of a heathen named Diosorus who kept her carefully guarded in a tower; during his absence on a journey she caused three windows to be made in her bath-house, as a symbol of the Trinity, instead of the two which her father had intended, and on his return she confessed herself to be a Christian. He dragged her to the prefect of the province, who had her tortured and beheaded. Her father, who himself carried out the death sentence, was struck by lightning as a punishment on the way home. Probably for this reason Barbara was regarded as the patron saint in thunderstorms, and as the protectress of artillerymen and miners. She is represented in art as standing by a tower with three windows, sometimes with cannon near by. The place of her martyrdom is variously given as Heliopolis, as a town of Tuscany, and as Nicomedia, Bithynia, about the year 235.

BARBARIAN, the name among the early Greeks for all foreigners, including the Romans (Gr *βάρβαρος*). The word probably represents the uncouth babbling of which languages other than their own appeared to the Greeks to consist. It soon assumed an evil meaning, becoming associated with the vices and savage natures of which they believed their enemies to be possessed. The Romans adopted the word for all peoples other than those under Graeco-Roman influence and domination. It has become synonymous with a general lack of civilization.

BARBARO, ERMOLAO (HERMOLAUS BARBARUS) (1454–c. 1493), Italian scholar, was born at Venice.

He edited and translated a number of classical works, of which the most important were: *Castigationes Plinianae* (1492), in which he boasted of having made 5,000 corrections in the text of Pliny's *Natural History*; *Themistius' Paraphrases* of certain works of Aristotle (1480); Aristotle's *Rhetorica* (published in 1544); *Castigationes in Pomponium Melam* (1493).

BARBAROSSA, the name given by the Christians to a family of Turkish admirals and sea rovers of the 16th century—Arouj and Khizr (alias Khair-ed-Din) and Hassan the son of Khair-ed-Din. In 1840 Capt. Walsin Esterhazy, author of a history of the Turkish rule in Africa, ventured the guess that "Barbarossa" ("Redbeard") was simply a mispronunciation of Bábá Arouj. The contemporary Arab chronicle published by S. Rang and F. Denis in 1837 says explicitly that Barbarossa was the name applied by Christians to Khair-ed-Din. The founder of the family was Yakub, a Roumeliot, probably of Albanian blood, who settled in Mitylene after its conquest by the Turks. He was a coasting trader and had four sons—Elias, Isaak, Arouj and Khizr, all said to have been born after 1482. Khizr became a potter and Isaak a trader. Elias and Arouj took to sea roving. In an action with a galley of the Knights of St. John, then established at Rhodes, Elias was killed and Arouj taken prisoner; the latter was ransomed by a Turkish pasha and returned to the sea. For some time he served the Mamelukes who still held Egypt. During the conflict between the Mamelukes and the sultan Selim I., he went to Tunis. The incessant conflicts among the Berber princes of northern Africa gave him employment as a mercenary, which he varied by piratical raids on the trade of the Christians. At Tunis he was joined by Khizr, who took, or was endowed with, the name of Khair-ed-Din. Isaak soon followed his brothers. Arouj and Khair-ed-Din joined the exiled Moors of Granada in raids on the Spanish coast. They also pushed their fortunes by fighting for, or murdering and supplanting, the native African princes. Their headquarters were in the island of Jerba in the Gulf of Gabès. They attempted in 1512 to take Bougie from the Spaniards, but were beaten off, and Arouj lost an arm, shattered by an arquebus shot. In 1514 they took Jijelli from the Genoese, and after a second beating at Bougie in 1515 were called in by the natives of Cherchel and Algiers to aid them against the Spaniards. They occupied the towns and murdered the native ruler who called them in. The Spaniards still held the little rocky island which gives Algiers its name and forms the harbour. In 1518 Arouj was drawn away to take part in a civil war in Tlemçen. He promptly murdered the prince he came to support and seized the town for himself. The rival party then called in the Spaniards, by whom Arouj was expelled and slain while fleeing at the Rio Salado. Khair-ed-Din clung to his possessions on the coast and appealed to the sultan, Selim I. He was named *beylerbey* by the sultan, and with him began the establishment of Turkish rule in northern Africa. For years he was engaged in subduing the native princes, and in carrying on warfare with the Christians. In 1510 he repelled a Spanish attack on Algiers, but he could not expel his enemies from the island till 1520.

As a combatant in the forefront of the war with the Christians he became a great hero in Islam, and dreaded by its enemies under his name of Barbarossa. In 1534 he seized Tunis, acting as Kapitan pasha for the Sultan Suleiman. The emperor, Charles V., intervened on behalf of the native prince, retook the town, and destroyed a great part of Barbarossa's fleet. He was absent from Algiers when it was attacked by Charles V. in 1541. In 1543–44 he commanded the fleet which Suleiman sent to the coast of Provence to support Francis I. Barbarossa would not allow the bells of the Christian churches to be rung while his fleet was at anchor in the ports. He plundered the coast of Italy on his way back to Constantinople. When he died in his palace at Constantinople he was succeeded as *beylerbey* of Africa by his son Hassan. Hassan Barbarossa, like his father, spent most of his life in the Levant.

BIBLIOGRAPHY.—J. von Hammer-Purgstall, *The History of the Ottoman Empire*, French trans. by J. J. Hellert (1835–43), contains accounts of the Barbarossas, but requires to be corrected by other

authorities. See *La Fondation de la régence d'Alger, histoire des Barberousse, chronique arabe du XVI^{ème} siècle*, published by Sander Rang and Ferdinand Denis (1837) for a curious Moslem version of their story. H. D. de Grammont has collected later evidence in his *Histoire d'Alger* (1887); and he discusses the origin of the name in a paper contributed to the *Revue Africaine*, No. 171. For the campaigns, see Ad. Jurien de la Gravière in *Les Corsaires barbaresques et la marine de Soliman le Grand* (1887), and *Doria et Barberousse* (1886). Hajji Khalifa, *History of the Maritime Wars of the Turks*, trans. by J. Mitchell for the Oriental Translation Fund (1831), is said to have been founded on evidence collected by order of the Sultan Suleiman.

BARBAROUX, CHARLES JEAN MARIE (1767–94), French revolutionist, was educated by the Oratorians of Marseille and became a successful lawyer. He was appointed secretary (*greffier*) to the commune of Marseille, and in 1792 was commissioned to go to the legislative assembly and demand the accusation of the directory of the department of Bouches-du-Rhône, as accomplice in a royalist movement in Arles. At Paris he was received in the Jacobin club and entered into relations with J. P. Brissot and the Rolands. It was at his instigation that Marseille sent to Paris the battalion of volunteers which contributed to the insurrection of Aug. 10 1792, against the king. Returning to Marseille he was elected deputy to the Convention by 775 votes out of 776 voting. From the first he posed as an opponent of the Mountain, accused Robespierre of aiming at the dictatorship (Sept. 25 1792), and proposed to break up the commune of Paris. Then he got the act of accusation against Louis XVI. adopted, and in the trial voted for his death "without appeal and without delay." During the final struggle between the Girondists and the Mountain, he refused to resign as deputy and rejected the offer made by the sections of Paris to give hostages for the arrested representatives. He succeeded in escaping, first to Caen, where he organized the civil war, then to Saint-Émilion, near Bordeaux. Discovered, he attempted to shoot himself, but was only wounded, and was taken to Bordeaux, where he was guillotined when his identity was established.

BIBLIOGRAPHY.—See Ch. Vatel, *Charlotte Corday et les Girondins* (1873); A. Aulard, *Les Orateurs de la Législative et de la Convention* (1906). Barbaroux's own *Mémoires* were published in 1822.

terranean, comprising Morocco, Algeria, Tunisia and Tripoli. The name is derived from the Berbers, the chief inhabitants of the region.

BARBARY APE, a tailless monkey inhabiting Algeria, Morocco and the rock of Gibraltar and referable to the group of macaques. This monkey, *Macacus inuus*, is light yellowish-brown above and yellowish-white below, with the naked part of the face flesh-coloured. It is terrestrial and goes about in droves.

BARBARY PIRATES. The power of the piratical coast population of northern Africa arose in the 16th century, attained

its greatest height in the 17th, declined gradually throughout the 18th and was extinguished by the French conquest of Algiers in 1830. From 1659 onwards the coast cities of Algeria and Tunisia, though nominally forming parts of the Turkish empire, were in fact anarchical military republics which chose their own rulers and lived by plunder. The maritime side of this long-lived brigandage was conducted by the captains, or *reises*, who formed a class or even a corporation. Cruisers were fitted out by capitalists and commanded by the *reises*. The treasury of the pasha or his successors, who bore the titles of Agha or Dey or Bey, received 10% of the value of the prizes. Bougie was the chief shipbuilding port. Until the 17th century the pirates used galleys, but Simon Danser, a Flemish renegade, taught them the advantage of using sailing ships. In the first half of the 17th century more than 20,000 captives were said to be imprisoned in Algiers alone. The rich were allowed to redeem themselves, but the poor were condemned to slavery. Their masters would not in many cases allow them to secure freedom by professing Mohammedanism.

After the general pacification of 1815, the British made two vain attempts to suppress Algerian piracy, which was only ended by the French invasion of 1830.

BARBAULD, ANNA LETITIA (1743–1825), English poet and miscellaneous writer, was born at Kibworth-Harcourt, in Leicestershire, on June 20 1743, and married Rochemont Barbauld, a Presbyterian minister. The Barbaulds set up a boarding-school at Palgrave, Suffolk, and Mrs. Barbauld's famous *Hymns in Prose* for children (1781), an excellent series of simple nature studies, were written for the pupils. The school was abandoned in 1785, and in 1802 the Barbaulds settled in London at Stoke Newington. Mrs. Barbauld died on March 9 1825; her husband had died insane in 1808. Mrs. Barbauld's numerous works include a share in her brother Dr. Aikin's *Evenings at Home*, editions of Akenside and Collins, the excellent collection of *British Novelists* (50 vols. 1810) with biographical and critical notices. A collected edition of her works, with memoir, was published by her niece, Lucy Aikin, in two volumes in 1825.

See A. L. le Breton, *Memoirs of Mrs. Barbauld* (1874); G. A. Ellis, *Life and Letters of Mrs. A. L. Barbauld* (1874), and Lady Thackeray Ritchie, *A Book of Sibyls* (1883).

BARBECUE (Span. *barbacoa*), originally a framework on posts placed over a fire on which to dry or smoke meat, hence, a gridiron for roasting whole animals, and in Cuba an upper floor on which fruit or grain is stored. In the United States the word means an open air feast, either political or social, where whole animals are roasted and eaten and other vast quantities of food and drink consumed.

BARBED WIRE. This is a protective variety of fencing wire which is barbed at regular intervals of $1\frac{1}{2}$ to 6 in. The ordinary barbed wire of commerce consists of two or three line wires twisted together with a fairly long lay or pitch, the barbed wires being tightly inter-woven and clinched at right-angles to the strand.

In the United States, barbed wire for fencing was originally suggested to meet conditions existing in the western states, by reason of the large cattle-raising industry in sections where timber was scarce. Farmers set themselves to find a way by which wire could be used without being destroyed by the animals it was intended to confine, and barbed wire not unnaturally suggested itself. So immediately did this device find favour with the farmers of the United States, and, in fact all over the world, that the manufacture of wire was revolutionized.

The practical beginning of the industry, was in the patents issued to Joseph F. Glidden of Dekalb, Ill., in 1874 for barbed fence wire, and during the same year, to Joseph F. Glidden and Phineas W. Vaughan, for a machine to manufacture it. These inventions were the foundation of the system of patents under which barbed wire has been protected and sold. In fact the commonest form of two-strand wire with barbs fastened to one wire only still goes by the name of "Glidden" brand.

The development of the barbed wire industry has been very much accelerated by the introduction of mild steel. Iron wire,

while it was highly resistant to corrosion, also had very great limitations both with regard to its tensile strength and other physical properties, and also because wire drawn from common iron could only be produced in comparatively short lengths. Fortunately, the qualities which puddled iron lacked were found in a high degree in steels manufactured by the open-hearth process.

Barbed and Meshed Wire.—The introduction of barbed wire met with some opposition both in the British Isles and America on humanitarian grounds, but ample and extended tests silenced this objection. Barbed wire is in wide use in the western states of America, although new types of meshed wire field fencing have been largely employed since 1890. Generally speaking, the use of barbed wire fencing in other countries has not been as extensive as in the western United States. While it has been used on a comparatively large scale in Argentina and Australia, both these countries use a much larger quantity of plain wire fence, and in Argentina there is an important consumption of high-carbon oval fence wire of great strength, which apparently forms the only kind of fence that meets the conditions in a satisfactory manner.

Approximate Production in Tons of Barbed Wire

Year.	United States.	British Isles.
1874	5	
1880	40,000	..
1900	200,000	
1924	200,000	9,700
1927	180,000	12,000

Barbed wire is usually shipped to customers on spools made of either timber and sheet iron or wire, each holding approximately 112 lbs or 600yds in length. A hole is provided through the centre of the spool for inserting a bar, on which the reel can revolve for unwinding the wire as it is put up. A 1cwt reel ready

FIG. 1.—THE SIX TYPES OF BARBED WIRE IN GENERAL USE. Numbers 1, 2 and 3 serve agricultural purposes; number 4 was used by the British Army in trench warfare; numbers 5 and 6, the Iowa type, are employed on Australian sheep farms.

for shipment carries a handle attached to the centre of the reel for carrying purposes, whilst a pulling handle is attached to the paying-out end of the reel so that the wire can be unrolled without danger of coming into contact with the barbs. After the wire is stretched in place, it is attached to the wooden posts by means of steel wire staples, ordinarily made from No. 9 galvanized wire.

Barbed wire fencing is now made in various patterns of which six kinds are shown (fig. 1). No. 1 is a hard high-tension line wire with barbs passing not only in between but around both wires.

No. 2 is a Glidden type, this being made from ordinary mild steel wire with a barb wrapped around one wire only. No. 3 is of the heavy 3-ply Glidden type; whilst No. 4 is of the heavy 2-ply Glidden type. No. 5 is the 2-ply type with barbs wrapped in between and around the two wires; whilst No. 6 is a heavier kind of the same type but with barbs spaced at twice the distance.

Manufacture.—The wire employed is made of soft Thomas or Siemens-Martin steel and is drawn in a wire mill. Annealing, cleaning and galvanizing of the wire are done by a continuous process. The coil of wire is placed on a reel. The first end of the wire is fed longitudinally through an annealing medium (either red-hot lead or heated fire-brick tubes) of sufficient length to soften the wire. From the annealing furnace, the wire is fed longitudinally through a bath of muriatic acid, which removes the scale, and from the acid, after washing, the wire passes through a fluxing tank and then on through a bath of spelter, which is heated about 30 degrees above melting point. After being cooled by water, the wire is wound on suitable take-up blocks into finished coils. From 30 to 60 wires are passing simultaneously in parallel lines through this continuous galvanizing apparatus. The galvanizing gives the wire a bright finish and protects it from corrosion. The barbing and twisting together of the two or three longitudinal strand wires is done by automatic machinery.

A brief description of the manufacture of 2- and 4-point Glidden wire is as follows:—Two coils of wire on reels are placed behind the machine, designed to form the main or strand wires of the fence. One of the main wires passes through the machine longitudinally. One or two coils of wire are placed on reels at either side of the machine for making 2- or 4-point wire respectively. These wires are fed into the machine at right angles to the strand wire. At each movement of the feeding mechanism, when fabricating 2-point wire, one cross wire is fed forward. A diagonal cut forms a sharp point on the first end. The wire is again fed forward and instantly wrapped firmly around one strand wire and cut off so as to leave a sharp point on the incoming wire as before, while the bit of pointed wire cut off remains as a double-pointed steel barb attached firmly to the strand wire. This wire armed with barbs at regular intervals passes on through a guide, where it is met by a second strand wire—a plain wire without barbs. The duplex strand wires are attached to a take-up reel, which is caused to revolve and take up the finished barbed wire simultaneously and in unison with the barbing machine. In this way the strand wires are loosely twisted into a 2-ply strand, armed with barbs projecting at right angles in every direction. A barbed wire machine, under the best possible conditions, will produce about 2,000 lb. of finished wire per day of eight hours.

In England, where the use of barbed wire has also become common, the Barbed Wire Act 1893 enacts that where on any land adjoining a highway barbed wire is used in such fashion as to be injurious to persons or animals, the local authority may require the occupier to abate the nuisance and on his failure to do so, may abate it themselves.

Barbed wire has come to be one of the most formidable defences that can be used in modern warfare, and in the World War of 1914–18 was used very extensively for entanglements and similar purposes. In some American states the use of barbed wire

is regulated by law, but as a rule these laws apply to placing barbed wire on highways. (See WIRE.) (E. A. A.)

BARBEL (*Barbus barbus*), a Cyprinid fish of the rivers of central Europe, found also in Yorkshire and in the Trent and Thames. The mouth has four barbels, used as feelers to search for food. It attains a weight of 50 lb. in the Danube. There are numerous species of *Barbus* in Africa and Asia, including the mahsee (*q.v.*).

BARBELLION, W.N.P., pen name of BRUCE FREDERICK CUMMINGS (1889–1919), English diarist and biologist, was born on Sept. 7, 1889, son of a journalist. He obtained a post at the Natural History Museum, South Kensington, and contributed articles on scientific subjects to scientific papers. He suffered from ill-health during his whole life in London, and after his marriage in 1915 with Miss Eleanor Benger, was told that his disease was disseminated sclerosis. He resigned his appointment in 1917, and died at Gerrard's Cross (Bucks.), on Oct. 22, 1919.

Barbellion's fame rests on the *Journal of a Disappointed Man* (1919), prepared by him from the entries in a diary which he had kept all his life. He himself describes his journal as "A self portrait in the nude;" and although it is possible that the circumstances of the author and his death six months after the publication had something to do with the great interest it excited, the book must be placed amongst the great autobiographical revelations in literature. His posthumous works were: *Enjoying Life, and Other Literary Remains* (1919); *A Last Diary* (1920).

BARBE-MARBOIS, FRANÇOIS, MARQUIS DE (1745–1837), French politician, was born at Metz. He began his public career as intendant of San Domingo under the old régime. At the close of 1789 he returned to France, and served the revolutionary government. He was twice arrested as a suspect and in 1797 was transported to French Guiana. Transferred to Oléron in 1799, he owed his liberty to Napoleon, after the 18th Brumaire. In 1801 he became councillor of state and director of the public treasury, and in 1802 a senator. In 1803 he negotiated the treaty by which Louisiana was ceded to the United States, and was rewarded by the First Consul with a gift of 152,000 fr. He changed his political colour with successive governments. Napoleon had made him president of the *cour des comptes*, and he retained his office under Louis XVIII.: he was minister of justice for a short time at the restoration after Waterloo, and then went into retirement. He was again president of the *cour des comptes* under Louis Philippe. He died on Feb. 12, 1837. He wrote: *Réflexions sur la colonie de Saint-Domingue* (1794), *De la Guyane, etc.* (1822), *Histoire de la Louisiane et la cession de cette colonie par la France aux États-Unis, etc.* (1828), and the story of his transportation after the 18th Fructidor in *Journal d'un déporté non jugé* (1834).

BARBER, one whose occupation it is to shave or trim beards, a hairdresser. In former times the barber's craft was dignified with the title of a profession, being conjoined with the art of surgery. In France the barber-surgeons were separated from the perruquiers, and incorporated as a distinct body in the reign of Louis XIV. In England barbers first received incorporation from Edward IV. in 1461. By 32 Henry VIII. c. 42, they were united with the company of surgeons, it being enacted that the barbers should confine themselves to the minor operations of blood-letting and drawing teeth, while the surgeons were prohibited from "barbery or shaving."

In 1745 barbers and surgeons were separated into distinct corporations by 18 George II. c. 15. The barber's shop was a favourite resort of idle persons; and in addition to its attraction as a focus of news, a lute, viol, or some such musical instrument was always kept for the entertainment of waiting customers. The barber's sign consisted of a striped pole, from which was suspended a basin, symbols the use of which is still preserved. The fillet round the pole indicated the ribbon for bandaging the arm in bleeding and the basin the vessel to receive the blood. Barber is from Lat. *barba*, beard.

See also BEARD, and *Annals of the Barber Surgeons of London* (1890).

BARBERINI, the name of a powerful Italian family, originally of Tuscan extraction, who settled in Florence during the

FIG. 3.—CUTTING THE BARBS
While the finger twists barbs, the cutters close on the wire to form the barb points

early part of the 11th century. They acquired great wealth and influence, and in 1623 Maffeo Barberini was raised to the papal throne as Urban VIII. He made his brother, Antonio, a distinguished soldier, and two nephews, cardinals, and gave to a third nephew, Taddeo, the principality of Palestrina. Great jealousy of their increasing power was excited amongst the neighbouring princes, and Odoardo Farnese, duke of Parma, made war upon Taddeo, and defeated the papal troops. After the death of Urban in 1644 his successor, Innocent X., showed hostility to the Barberini family. Taddeo fled to Paris, where he died in 1647, and with him the family became extinct in the male line. His daughter, Cornelia, married Prince Giulio Cesare Colonna di Sciarra in 1728, who added her name to his own. On the death of Prince Enrico Barberini-Colonna the name went to his daughter and heiress, Donna Maria, and her husband, Marquis Luigi Sacchetti, who received the title of prince of Palestrina and permission to bear the name of Barberini. The fine Barberini palace and library in Rome give evidence of their wealth and magnificence. The ruthless way in which they plundered ancient buildings to adorn their own palaces is the origin of the saying, "Quod non fecerunt barbari, fecerunt Barberini."

See A. von Reumont, *Geschichte der Stadt Rom* (1868), iii. b. 611-612, 615, 617, etc.; *Almanach de Gotha* (Gotha, 1902); J. H. Douglas, *The Principal Noble Families of Rome* (1905).

BARBERRY (*Berberis vulgaris*), a shrub with spiny-toothed leaves, which on the woody shoots are reduced to forked spines, and pale yellow flowers in hanging racemes, which are succeeded by orange-red berries. It is a member of the botanical family *Berberidaceae*, which contains about 190 species in the north temperate zone and in the Andes of South America extending into Patagonia. The berries of *Berberis* are edible; those of the native barberry are sometimes made into preserves. The alkaloid berberine (*q.v.*) occurs in the roots.

BARBER'S ITCH, known also as ringworm of the beard, is a communicable disease of the skin of the bearded region. The causes are molds (*Trichophyton cerebriforme* and *rosaceum*) which are usually transferred from person to person in the barber shop. The disease is characterized by nodules of varying sizes which occur on the jaw, chin and neck and which represent foci of inflammation in and about the hair follicles. The hair over them is stubby, and thin pus exudes from the follicles. In spite of the name, there is no itching. The skin is often reddened and sore, especially over the nodules. The diagnosis is confirmed by finding the fungus microscopically in the hairs. The disease is chronic and if it ends spontaneously there is considerable loss of hair. If treated it is curable and leaves no traces. Treatment consists in depilation, antiseptic ointments and X-ray. (See RINGWORM.)

BARBERTON, a district and a town in the Transvaal. The town, 25° 35' S and 31° 11' E., is situated on the slopes of the De Kaap Valley, and is overlooked by De Kaap, a peak of the Drakenberg. It is 2,825 ft. above sea-level and is 136 m. by rail from Lourenço Marques and 283 from Pretoria. The town grew as a consequence of the gold rush to the district, 1882-86, and quickly attracted a population of about 8,000. By 1887 the boom was past, and the town began to decline. Its present white population is 1,071. The town is lighted by electricity and has a good water supply. The district has developed along agricultural lines. It is one of the principal areas in South Africa for citrus fruit and cotton, and it produces considerable quantities of tobacco and of such subtropical fruit as pawpaws, mangoes and pineapples. Several thousand acres are under irrigation, and tomatoes are being grown for the winter markets of South Africa. The rainfall averages 31.7 in. per annum. Gold is still mined, the production for 1924 being 41,712 ounces. Talc and nickel are also worked. Malaria was formerly very severe and still occurs in the valleys.

BARBERTON, a manufacturing city of Summit county, Ohio, U.S.A., 6 m. S.W. of Akron, on the Tuscarawas river. It is served by the Baltimore and Ohio, the Erie and the Pennsylvania railroads, and by a belt line to Akron. The population increased from 4,354 in 1900 to 18,811 in 1920, of whom 4,476 were foreign-born white, and was estimated at 23,286 in 1925. The principal manufactures are automobile tyres, matches, high ten-

sion insulators and bailers. The output of its 39 establishments in 1925 was valued at \$36,443,790.

BARBET, the general name for birds of the family *Capitonidae*. They inhabit the warm regions of the world, but are absent from Australia. The plumage is usually predominantly green and the beak large and stout. They feed mainly on fruit and lay several white eggs in holes in trees. The blue-throated barbet (*Cyanops asiatica*), of eastern Asia, is the best known in captivity. The family also includes the coppersmith (*q.v.*) and the South African tinker (*Barbatula pusilla*), the latter a small black, yellow and white bird with a red cap.

BARBETTE, a platform inside a fortification raised sufficiently high for artillery placed thereon to be able to fire *en barbette*, viz., over the top of the parapet; also in warships a raised platform, protected by armour on the sides and top upon which guns are mounted *en barbette*. (Fr. diminutive of *barbe*, a beard).

BARBEY D'AUREVILLY, JULES AMÉDÉE (1808-1889), French man of letters, was born at Saint-Sauveur-le-Vicomte (Manche). His most famous novels are *Une Vieille Maîtresse* (1851), attacked at the time of its publication on the charge of immorality; *L'Ensorcelée* (1854), an episode of the royalist rising among the Norman peasants against the first republic; the *Chevalier Destouches* (1864); and a collection of extraordinary stories entitled *Les Diaboliques* (1874). Barbey d'Aureville is an extreme example of the eccentricities of which the Romantics were capable, and to read him is to understand the discredit that fell upon the manner. He was literary critic of the *Pays*, and a number of his essays, contributed to this and other journals, were collected as *Les Oeuvres et les hommes du XIX^e siècle* (1861-65). Other literary studies are *Les Romanciers* (1866) and *Goethe et Diderot* (1880).

See also Alcide Dusolier, *Jules Barbey d'Aureville* (1862), a collection of eulogies and interviews; Paul Bourget, preface to d'Aureville's *Memoranda* (1883); Jules Lemaitre, *Les Contemporains*; Eugène Gréllé, *Barbey d'Aureville, sa vie et son oeuvre* (1902); René Doumic, in the *Revue des deux mondes* (Sept. 1902).

BARBEYRAC, JEAN (1674-1744), French jurist, the nephew of Charles Barbeyrac, a physician of Montpellier, was born at Béziers in Lower Languedoc. Migrating with his family into Switzerland after the revocation of the edict of Nantes, he studied jurisprudence at Geneva and then at Frankfurt-on-Main, and became professor of belles-lettres in the French school of Berlin. Thence, in 1711, he was called to be professor of history and civil law at Lausanne, and finally settled as professor of public law at Groningen. His fame rests chiefly on the preface and notes to his translation of Pufendorf's treatise *De Jure Naturae et Gentium*. In theory he follows closely Locke and Pufendorf; but he works out with great skill the theory of moral obligation, referring it to the command or will of God. He indicates the distinction, developed more fully by Thomasius and Kant, between the legal and moral qualities of action. The principles of international law he reduces to those of the law of nature, and combats many of the positions taken up by Grotius. He rejects the notion that sovereignty resembles property, and makes even marriage a matter of civil contract.

Barbeyrac also trans. into French, Grotius's *De Jure Belli et Pacis* (1724) dedicated to "Sa majesté Britannique, George I."; Cumberland's *De Legibus Naturae*; and Pufendorf's small treatise, *De Officio Hominis pères*; a history of ancient treaties contained in the *Supplément au grand corps diplomatique*, and the curious *Traité du jeu* (1709), in which he defends the morality of games of chance.

BARBICAN, an outwork for the defence of a gate or drawbridge; also a sort of penthouse or construction of timber to shelter wardens or sentries from arrows or other missiles. The word is probably of Arabic or Persian origin.

BARBIER, ANTOINE ALEXANDRE (1765-1825), French librarian and bibliographer, became librarian successively to the Directory, to the Conseil d'État, and in 1807 to Napoleon, for whom he carried out a number of commissions. He had a share in the foundation of the libraries of the Louvre, of Fontainebleau, of Compiègne and Saint-Cloud; under Louis XVIII, he became administrator of the king's private libraries, but in 1822 he was deprived of all his offices. His *Dictionnaire des*

ouvrages anonymes et pseudonymes (1806-09; 3rd ed. 1872-79) is still an indispensable work of reference.

See also a notice by his son, Louis Barbier, and a list of his works prefixed to the 3rd ed. of the *Dict. des ouvrages anonymes et pseudonymes*.

BARBIER, HENRI AUGUSTE (1805-1882), French dramatist and poet, was born in Paris. Inspired by the revolution of July he poured forth a series of eager, vigorous poems, denouncing, crudely enough, the evils of the time. They are spoken of collectively as the *Iambes* (1831), though the designation is not strictly applicable to all. As the name suggests, they are modelled on the verse of André Chénier. The rest of Barbier's poems are forgotten, and when, in 1869, he received the long delayed honour of admission to the Academy, Montalembert expressed the general sentiment in his *Barbier? mais il est mort!*

See Sainte-Beuve, *Portraits contemporains*, vol. ii.

BARBIERI, GIOVANNI FRANCESCO (otherwise called GUERCINO, from his squinting) (1591-1666), Italian historical painter, was born at Cento, near Bologna. His artistic powers were developed very rapidly, and at the age of seventeen he was associated with Benedetto Gennari (1550-1610), a well-known painter of the Bolognese school. In 1615 he removed to Bologna. His first style was formed after that of the Caracci; but the strong colouring and shadows employed by Caravaggio deeply impressed him, and for a considerable period his productions showed that painter's influence. Some of his latest pieces approach rather to the manner of his great contemporary Guido. He completed no fewer than 106 large altar-pieces for churches, and his other paintings amount to about 144. His most famous piece is thought to be the St. Petronilla, which was painted at Rome for Gregory XV. and is now in the Capitol. In 1626 he began his frescoes in the Duomo at Piacenza.

His brother, PAOLO ANTONIO BARBIERI (1603-49), was a celebrated painter of still life and animals.

See J. A. Calvi, *Life of G. F. Barbieri* (1808).

BARBITON or **BARBITOS**, ancient stringed instrument known to us from the Greek and Roman classics, but derived from Persia. Although in use in Asia-Minor, Italy, Sicily, and Greece, it is evident that the barbiton never won for itself a place in the affections of the Greeks of Hellas; it was regarded as a barbarian instrument affected by only those whose tastes in matters of art were unorthodox.

In outline it resembled a large lute with a wide neck, and the seven or nine strings of the lyre. Although it probably underwent considerable modification at the hands of the Greeks, it retained until the end the characteristics of the lyre whose strings were plucked, whereas the rebab was sounded by means of the bow at the time of its introduction into Europe.

An instrument called barbiton was known in the early part of the 16th and during the 17th century. It was a kind of theorbo or bass-lute, but with one neck only, bent back at right angles to form the head. Robert Fludd gives a detailed description of it with an illustration. The people called it a theorbo, but the scholar having identified it with the instrument of classic Greece and Rome called it barbiton.

BARBITURIC ACID, a white, crystalline, organic chemical compound ($C_4H_4N_2O_3 \cdot 2H_2O$), prepared by condensing di-ethyl malonate and urea, is soluble in water, alcohol and ether. It forms salts (*q.v.*) with metals and these metal salts may be reacted with organic halogen compounds to form other compounds in which either one or two, as desired, of the hydrogen atoms of the original barbituric acid have been replaced by an organic radical. These same substituted compounds may be prepared directly by using a substituted derivative of di-ethyl malonate in the original

condensation. Barbituric acid finds little use except as a starting material for the preparation of derivatives. Barbitone is sparingly soluble in cold water while sodium barbitone is very soluble. The dose of either is 3 to 10 grains. These two drugs are quickly absorbed and act rapidly. Within an hour or so of the administration by mouth of a therapeutic dose drowsiness is induced, and a satisfactory period of natural sleep should ensue. The effect lasts from six to twelve hours and no unpleasant after-effects should follow the taking of a single clinical dose.

Many other derivatives of barbituric acid have been introduced: *Luminal* or diphenyl barbituric acid and its sodium salt "Sodium luminal," dose $1\frac{1}{2}$ to 5 grains. These drugs have also been used for warding off the convulsions of epilepsy and are given in doses of $\frac{1}{2}$ to 1 grain once or twice daily for this purpose; *Proponal* or dipropyl barbituric acid, dose 2 to 6 grains as hypnotic; *Soneryl* or butyl-ethyl barbituric acid, dose 1 to 3 grains; *Dial* or di-allyl barbituric acid, dose 1 to $4\frac{1}{2}$ grains; *Gardenal* or phenyl ethyl barbituric acid; *Phanodrom* or cyclo hexenyl barbituric acid.

Combinations of barbituric acid with other compounds are:—*Allonal*, a combination of allyl isopropyl barbituric acid with amidopyrin; *Veramon*, a combination of veronal and ethyl amido phenyl di-methyl pyrazolon; *Cibalgin*, a combination of dial and amidopyrin; *Beatol*, a combination of veronal with extracts of valerian and jusquiame; *Somnifene*, a mixture of veronal and allyl isopropyl barbituric acid.

The barbituric acid derivatives are powerful drugs, and it is most important that they should be taken only under medical advice. If these drugs are taken in doses exceeding the proper therapeutic dose poisonous effects may follow; thus, instead of sleep, deep loss of consciousness or coma may result. In this condition there is great danger of broncho-pneumonia (so called veronal pneumonia) which is a complication usually having a fatal termination.

The continued daily use of full therapeutic doses of barbituric acid compounds may be followed by symptoms of chronic poisoning such as headache, vertigo, severe mental depression and moral changes. The speech may become thick and articulation indistinct; the gait ataxic and reeling like that of alcoholic intoxication or cerebellar disease. Cerebral symptoms, such as drowsiness, visual hallucinations, delusions, squint, double vision, facial weakness, ptosis and nystagmus may occur. Skin rashes have been observed. Abnormal conditions of the urine such as the presence of albumen and casts have been described.

Drug Addiction (*q.v.*) may follow the continued daily therapeutic use of the barbituric acid group of drugs, and this is frequently accompanied by some of the symptoms above described.

The mental depression associated with persons addicted to the frequent use of barbituric acid compounds sometimes leads to the taking of a large overdose with fatal result. The returns of the registrar-general for England and Wales show from 1905 to 1925 a total of 257 cases of fatal poisoning from barbituric acid derivatives, most of these being cases of barbitone poisoning.

"Tolerance" to the barbituric acid group of drugs does not follow their continued use. It is therefore of great importance that the therapeutic dose should never be exceeded. In this respect these drugs differ from other addiction drugs, such as morphine and cocaine, where a remarkable tolerance may be established.

Fatal Dose.—In a healthy adult about 50 grains of barbitone probably represents the average minimum fatal dose. Cases of death have been recorded after taking much smaller doses, but in these other factors were usually present so that death was probably not entirely due to the drugs.

Regulations as to Sale.—On April 14, 1914, the barbituric acid group of drugs were placed under Part II. of the Schedule of Poisons. In 1918 they were placed under Part I. of the Poisons Schedule by order of the Privy Council.

(W. H. W1.)

BARBIZON, a village, near the forest of Fontainebleau, France, which gave its name to the "Barbizon school" of painters, whose leaders were Corot, Rousseau, Millet and Daubigny, together with Diaz, Dupré, Jacque, François, Harpignies and others. They put aside the conventional idea of "subject" in their pictures of landscape and peasant life, and went direct to the fields

FROM SCHLESINGER, "INSTRUMENTS OF THE ORCHESTRA AND PRECURSORS OF THE VIOLIN FAMILY"

THE BARBITON, A MUSICAL INSTRUMENT ONCE POPULAR AMONG ANCIENT MEDITERRANEAN PEOPLES

and woods for their inspiration. The distinctive note of the school is seen in the work of Rousseau and of Millet, each of whom, after spending his early years in Paris, made his home in Barbizon. Unappreciated, poor and neglected, it was not until after years of struggle that they attained recognition and success. They both died at Barbizon—Rousseau in 1867 and Millet in 1875. It is difficult now to realize that their work, so unaffected and beautiful, should have been so hardly received. To understand this, it is necessary to remember the conflicts that existed between the classic and romantic schools in the first half of the 19th century, when the classicists, followers of the tradition of David, were the predominant school. The romantic movement, with Géricault, Bonington and Delacroix, was gaining favour. In 1824 Constable's pictures were shown in the Salon, and confirmed the younger men in their resolution to abandon the lifeless pedantry of the schools and to seek inspiration from nature. In those troubled times Rousseau and Millet unburdened their souls to their friends, and their published lives contain many letters, some extracts from which will express the ideals which these artists held in common, and show clearly the true and firmly-based foundation on which their art stands. Rousseau wrote, "It is good composition when the objects represented are not there solely as they are, but when they contain under a natural appearance the sentiments which they have stirred in our souls. . . . For God's sake, and in recompense for the life He has given us, let us try in our works to make the manifestation of life our first thought: let us make a man breathe, a tree really vegetate." And Millet—"I try not to have things look as if chance had brought them together, but as if they had a necessary bond between themselves. I want the people I represent to look as if they really belonged to their station, so that imagination cannot conceive of their ever being anything else. People and things should always be there with an object. I want to put strongly and completely all that is necessary, for I think things weakly said might as well not be said at all, for they are, as it were, deflowered and spoiled—but I profess the greatest horror for uselessness (however brilliant) and filling up. These things can only weaken a picture by distracting the attention toward secondary things." In another letter he says—"Art began to decline from the moment that the artist did not lean directly and naively upon impressions made by nature. Cleverness naturally and rapidly took the place of nature, and decadence then began. . . . At bottom it always comes to this: a man must be moved himself in order to move others, and all that is done from theory, however clever, can never attain this end, for it is impossible that it should have the breath of life." The ideas of the "Barbizon school" only gradually obtained acceptance, but its chief members now rank among the greater artists of their time.

See D. Croal Thomson, *The Barbizon School* (1891), with a list of French authorities; Jules Breton, *Nos peintres du siècle*, Paris, 1900.

BARBON, NICHOLAS (c. 1640–1698), English economist, probably the son of Praise-God Barbon, was born in London, studied medicine at Leyden, graduated M.D. at Utrecht in 1661, and was admitted an honorary fellow of the College of Physicians in 1664. He took considerable part in the rebuilding of London after the great fire of 1666, and has a claim to be considered the institutor of fire-insurance in England, which he started somewhere about 1680. He was M.P. for Bramber in 1600 and 1605. He founded a land bank which, according to contemporaries, was fairly successful and was united with that of John Briscoe in 1690. He died in 1698, and appointed John Asgill his executor, with instructions that none of his debts should be paid. His writings are interesting as expressing views much in advance of his time and very near akin to those of modern times on such important topics as value, rent, and foreign trade. Barbon anticipated to some extent the conclusions of Adam Smith on the division of labour and the theory of currency as expounded by Ricardo. The more important of his works were *Apology for the Builder; or a Discourse showing the Cause and Effects of the Increase of Building* (1685), in which he discussed the theory of rent; *A Discourse of Trade* (1690), which insisted that exports could only be paid for by imports; and *A Discourse Concerning Coming the New Money Lighter* (1696).

See Stephan Bauer, "Ein Beitrag zur Vorgeschichte der Klassischen Oekonomik," in Conrad's *Jahrbücher für Nationalökonomie, und Statistik*, vol. xxi. (Jena, 1890).

BARBON, BAREBONE or BAREBONES, PRAISE-GOD (c. 1596–1680), English leather-seller and Fifth Monarchy man from whom the "Barebones" Parliament derived its nickname, was minister to a congregation which assembled at his own house, "The Lock and Key," in Fleet street, where his preaching attracted large audiences. He wrote two books in support of paedobaptism, and his congregation had separated from a larger one of Baptists on that point of controversy. Later he belonged to the sect of Fifth Monarchy men. On Dec. 20, 1641, his house was stormed by a mob, and he narrowly escaped with his life. Barbon, who was a man of substantial property, was summoned by Cromwell, on June 6, 1653, as a member for London, to the assembly of nominees called after him in derision "Barebone's Parliament." He appears to have taken no part in the debates. In 1660 he showed great activity in endeavouring to prevent the Restoration. On March 31 he was obliged to sign an engagement to the council not to disturb the peace, and on Nov. 26, 1661, he was arrested, together with John Wildman and James Harrington, and was imprisoned in the Tower till July 27, 1662, when he was released on bail.

BARBOUR, JOHN (1316?–1395), Scottish poet, was born perhaps in Aberdeenshire, early in the 14th century, approximately 1316. In a letter of safe-conduct dated 1357, allowing him to go to Oxford for study, he is described as archdeacon of Aberdeen. He is named in a similar letter in 1364 and in another in 1368 granting him permission to pass to France, probably for further study at the university of Paris. In 1372 he was one of the auditors of exchequer, and in 1373 a clerk of audit in the king's household. In 1375 (he gives the date, and his age as 60) he composed his best known poem *The Brus*, for which he received, in 1377, the gift of ten pounds, and, in 1378, a life-pension of 20 shillings. Additional rewards followed, including the renewal of his exchequer auditorship. According to the obit-book of the cathedral of Aberdeen, he died March 13, 1395.

Considerable controversy has arisen regarding Barbour's literary work. If he be the author of the five or six long poems which have been ascribed to him by different writers, he adds to his importance as the father of Scots poetry the reputation of being one of the most voluminous writers in Middle English, certainly the most voluminous of all Scots poets.

(1) *The Brus*, in 20 books, and running to over 13,500 four-accent lines, in couplets, is a narrative poem with a purpose partly historical, partly patriotic. It opens with a description of the state of Scotland at the death of Alexander III. (1286) and concludes with the death of Douglas and the burial of the Bruce's heart (1332). The central episode is the battle of Bannockburn. Patriotic as the sentiment is, it is in more general terms than is found in later Scots literature. The king is a hero of the chivalric type common in contemporary romance; freedom is a "noble thing" to be sought and won at all costs; the opponents of such freedom are shown in the dark colours which history and poetic propriety require; but there is none of the complacency of the merely provincial habit of mind. The lines do not lack vigour; and there are passages of high merit, notably of the oft-quoted section beginning "A! fredome is a noble thing." Despite a number of errors of fact, notably the confusion of the three Bruces in the person of the hero, the poem is historically trustworthy, as compared with contemporary verse-chronicle, and especially with the *Wallace* of the next century. No one has doubted Barbour's authorship of the *Brus*, but argument has been attempted to show that the text as we have it is an edited copy, perhaps by John Ramsay, a Perth scribe, who wrote out the two extant texts, one being preserved in the Advocates' Library (now the National Library of Scotland), Edinburgh, and the other in the library of St. John's College, Cambridge, England. Extensive portions of the poem have been incorporated by Wyntoun (q.v.) in his *Chronicle*. The first printed edition extant is Charteris's (Edinburgh, 1571); the second is Hart's (Edinburgh, 1616).

(2) Wyntoun speaks (Chronicle III. iii.) of a "Treteis" which Barbour made by way of "a genealogy" of "Brutus lynagis"; and elsewhere in that poem there are references to the archdeacon's "Stewartis Oryginale." This "Brut" is unknown; but the reference has been held by some to be to (3) a Troy-book, based on Guido da Colonna's *Historia Destructionis Troiae*. Two fragments of such a work have been preserved in texts of Lydgate's *Troy-book*, the first in ms. Camb. Univ. Lib. Kk. v. 30, the second in the same and in ms. Douce 148 in the Bodleian library, Oxford. This ascription was first made by Henry Bradshaw, the librarian of Cambridge University; but the consensus of critical opinion is now against it.

(3) Yet another work was added to the list of Barbour's works by the discovery, in the university library of Cambridge by Henry Bradshaw, of a long Scots poem of over 33,000 lines, dealing with *Legends of the Saints*, as told in the *Legenda Aurea* and other legends. The general likeness of this poem to Barbour's accepted work in verse-length, dialect and style, and the fact that the lives of English saints are excluded and those of St. Machar (the patron saint of Aberdeen) and St. Ninian are inserted, made the ascription plausible. Later criticism, though divided, has tended in the contrary direction, and has based its strongest negative judgment on the consideration of rhymes, assonance, and vocabulary (see Bibliography).

(4) If Barbour be the author of the *Legends*, then (so does one conclusion hang upon another) he is the author of a Gospel story with the later life of the Virgin, described in the prologue to the *Legends* and in other passages as a book "of the birth of Jhesu criste" and one "quhare-in I recordit the genology of our lady sanct Mary."

(5) In recent years an attempt has been made to name Barbour as the author of the *Buik of Alexander* (a translation of the *Roman d'Alexandre* and associated pieces, including the *Vœux du Paon*), as known in the unique edition, c. 1580, printed at the Edinburgh press of Alexander Arbuthnot. The "argument" as it stands is nothing more than an exaggerated inference from parallel passages in the *Bruce* and *Alexander*; and it makes no allowance for the tags, epithets, and general vocabulary common to all writers of the period. Should the assumption be proved to be correct, and should it be found that the "Troy fragments" were written first of all, followed by *Alexander* and *Bruce* or *Bruce* and *Alexander*, and that the *Legends* end the chapter, it will be by "evidence" other than that which has been produced.

For Barbour's life see *Exchequer Rolls of Scotland*, ii. and iii., *Registrum Episcopatus Aberdonensis* (Spalding Club); Rymer's *Foedera*.

BIBLIOGRAPHY—(1) *The Brus* mss. and early editions u.s. Modern editions: J. Pinkerton (1790) (called by the editor "the first genuine edition," because printed from the Advocates' Library text, but carelessly); Jamieson (1820); Cosmo Innes (Spalding Club, 1856); W. W. Skeat (Early English Text Society, 1870-89, reprinted, after revision by the editor, by the Scottish Text Society, 1893-95). On the question of the recension of Barbour's text, see J. T. T. Brown, *The Wallace and The Bruce restudied* (Bonn, 1900). (2 and 3) *Troy Fragments*. C. Horstmann has printed the text in his *Legendensammlung* (ut infra). See Bradshaw, *Transactions of the Cambridge Antiquarian Society* (1866); the prolegomena in Horstmann's edition; Skeat, *Brus* (S.T.S. edit. u.s. pp. xlv. et seq.); Köppel, "Die Fragmente von Barbour's Trojanerrieg," in *Englische Studien*, x. 373; Panton and Donaldson, *The Gest iistoriale of the Destruction of Troye* (E. E. T. S. pt. ii. Introd. pp. x. et seq.); G. Neilson (ut infra); and J. T. T. Brown (ut supra) passim. (4) *Legends of the Saints*. C. Horstmann, who upholds Barbour's authorship, has printed the text in his *Barbour's des schottischen Nationaldichters Legendensammlung nebst den Fragmenten seines Trojanerrieges* (Heilbronn, 1881-82), and that of the legend of St. Machor in his *Altenglische Legenden. Neue Folge* (Heilbronn, 1881) pp. 189-208. A later edition by W. M. Metcalfe, who disputes Barbour's claim, appeared in 1896 (*Legends of the Saints in the Scottish Dialect of the Fourteenth Century*, Scottish Text Society). See the introduction to these editions; also Skeat and Köppel u.s., and P. Buss, *Sind die von Horstmann herausgegebenen schottischen Legenden ein Werk Barbares?* (Halle, 1886) (cf. *Anglia* ix. 3, 1886). (5) For the Gospel-story evidence see Metcalfe, u.s. I. xxix. Brown u.s., "Postscript," pp. 156-171; and *Athenaeum*, Nov. 17, Dec. 1 and 8, 1900, and Feb. 9, 1901. (G. G. S.)

BARBUDA, an island in the British West Indies, 25m. north of Antigua, of which it is a dependency, in 17° 33' N. and 61° 43' W. Area 62 sq.m. Pop. 903. It is flat and well-wooded. On the western side is a large lagoon, separated from the sea by a reef of coral. The cultivated land is fertile, and the climate very healthy. The island was annexed by Great Britain in 1628 and granted to the Codrington family in 1680, who held it for more than 200 years. It is now Government property. Cotton is the leading product. Cattle, horses, mules and asses are bred, with the help of a Government stock farm. Salt, phosphate of lime and turtle are also exported. There are wild deer.

BARBUSSE, HENRI (1874-), French man of letters, was born in Paris, May 17, 1874. Educated at the Collège Rollin, he became a journalist. In 1910 he was editing the periodical *Je Sais Tout*, but found time to write novels, of which *Les Suppliants* (1903) and, in particular, *L'Enfer* (1908), an intense tragedy tinged with melodrama, won considerable success. He is known chiefly for a brutal piece of realism, *Le Feu* (1916), which won the Prix Goncourt in 1917 and remains one of the most unforgettable pictures of modern war. Later he became a correspondent of the socialist journal *L'Humanité* and devoted his time to preaching against war. Among his other works are *Clarté* (1919); *La lueur dans l'Abîme* (1920); and *Quelques coins du cœur* (1921); *Manifeste aux intellectuels* (1927).

BARCA (mod. EL MERG, pop. 3,000), in Cyrene, founded in the middle of the 6th century B.C. Rising quickly to importance it became a rival of Cyrene, and gave its name to the west of Cyrene's territory. Barca is said to have owed its origin to Greek refugees flying from the tyranny of Arcesilaus II. (see CYRENE), but it was rather Libyan than Greek at all times. A Persian force invited by Pheretima, mother of Arcesilaus III., in revenge for Barcan support of a rival faction, sacked it in 512 B.C. and deported a number of its inhabitants to Bactria. Under Ptolemaic rule it began to decline, like Cyrene, and its port Ptolemais (Tolmeta) took its place; but after the Arab conquest (A.D. 641) it became the chief place of the Cyrenaica for a time. Scanty remains of antiquity are visible. El Merg lies about ten miles from the coast on the crest of Jebel Akhdar, here sunk to a low and fertile downland. It is connected by rail with Bengasi (66m.).

BARCAROLLE or **BARCAROLE**, properly a musical term for the songs sung by the Venetian gondoliers, and hence for an instrumental or vocal composition, generally in 6-8 time, written in imitation of their characteristic rhythm. Famous examples are those of Chopin (one of his greatest works), Offenbach (the well-known number in *Les Contes d'Hoffmann*), and Mendelssohn (in his *Songs without Words*).

BARCELONA, a maritime province of north-eastern Spain, formed in 1833 out of districts belonging to the then province, and earlier principality, of Catalonia. Pop. (1920) 1,349,282; area 2,971sq.m. The axis of the province is the valley of the Llobregat, about which its small regions are more or less symmetrically arranged. From the Sierra del Cadi to Berga, the Bergadà is a region of mountainous pastures, and of industry and agriculture in the high valleys, which combine fertility with some degree of mineral wealth. Berga (pop. 1920, 5,673), with lignite mines and cement manufactures for which the Llobregat supplies water-power by canal, stands in front of the mountains, overlooking towards the south a monotonous zone of small plateaux and of truncated conical hills. The development of flat surfaces in this zone, which keeps the rainfall relatively low, is reflected in the regional names: *Plana de Vich*, the great stock-raising area in the east of the province, crossed by the river Ter, and *Plà de Bages*, in the west, the northern limit of viticulture in Barcelona. Between these regions is the *Llusanès*, while they are flanked in échelon by the mountainous *Guàrdies*, famous in the annals of banditry, which stretches into the neighbouring province of Gerona, and by the arid *Segarra* in the west, which, with its stunted woods, is an inlier of the Segre depression. Variety of line and delicacy of tint mark the topography of the saline area to which the salt hills of Cardona, exploited since Roman times, belong. The importance of this area has been very greatly

increased by the discovery in 1912 of extensive potash deposits (sylvine and carnallite). On the south the surface of the zone, which descends gradually from 750 metres at Berga, rises again more rapidly towards a mountain chain of which the culminating points are the Montsery (1,779 metres) and the Montserrat (1,236 metres). The scarped southern face of this chain forms the northern wall of the undulating lowlands of the Panadés and

THE "WAVE," A FEATURE OF MODERN BARCELONA APARTMENT HOUSES. IT IS AN ATTEMPT TO REFLECT THE TOWN'S SEAPORT ATMOSPHERE

Vallés, and is cut by the gorge of the Llobregat, followed by the railway. Martorell, standing where the river Noya joins the Llobregat, commands the exit from the Panadés towards the south-east, but Villafranca, in the centre of the lowland, is the principal town of this region of vineyards and of winter pastures, which communicates with the sea also at Villanueva, the port of export for its wines. The Vallés, the granary of the province, whence the name of the capital Granollers, on the Besós, is also important industrially. In front of these lowlands extends the Catalan coastal chain, cut in segments by the Tordera, Besós and Llobregat, and ending in the south-west in the cliffs of the Garraf coast. By these cliffs the continuity of the low coastal zone is broken; the plain of Mataró and Arenys del Mar, with alluvia derived from the granitic section of the coastal chain between the Tordera and the Besós, and the plain of Barcelona, to Castelldefels in the west of the Llobregat delta, are separated from the small western plain of Villanueva.

The predominance of light soils suitable for viticulture brings Barcelona into the second position among Spanish provinces in acreage devoted to the vine (290,000ac., replanted with American vines, 1924) and the yield per acre is exceptionally high. Variety is the characteristic of the products of the soil, which include the orange and peach, ripened in the warm coastal valleys, the carob and almond, and the vegetables, cereals and fruits grown on the extraordinarily fertile and intensively cultivated alluvial flats. But the cities are dependent on other provinces for their supply of meat and wheat. The economic conditions are not very favourable to stock, but the province is one of the chief swine-raising provinces of Spain (131,166; 1924). Over 50,000ac. are irrigated, and the *Acequia Condal*, drawing from the Besós, may be one of the oldest irrigation works in Spain; the standard of farming is very high in the minutely-subdivided and high-rented irrigated area. The wide extension of industry and the importance of the transit trade, both facilitated by the excellence of the means of communication, including the rural roads, give the province its chief character and are mainly responsible for the density of population, second only to that of Biscay. The rate of illiteracy, including the capital, is 24.8%, the eighth lowest in Spain.

BARCELONA, formerly capital of Catalonia, and since 1833 capital of the province of Barcelona in eastern Spain; the seat of a bishop. Pop. (1920) 710,335. The city and suburbs occupies an amphitheatre between the flood-plains of the rivers Llobregat and Besós, facing south-east to the Mediterranean and backed by a section of the Catalanian coastal chain which forms

a pyramid culminating in the Tibidabo (532 metres). In easy communication by the valleys of the above rivers both with the structural depressions of the Panadés and the Vallés, lying behind the coastal chain, and with the lowlands to the north of the inner mountain chain, Barcelona lies both on the coastal road and at the end of its connections with interior communications. The fortified hill of Montjuich (175 metres) rising from the sea to the south-west, separates the city from the mouth of the Llobregat. The entire amphitheatre is now urbanized. Country houses of wealthy merchants reach out to the slopes of the bounding hills from villages and townships which formerly lay in a ring round the city and have now been absorbed; the new quarter, *Ensanche*, with uniformly designed blocks of houses laid out in a rectangular scheme, welds these suburbs to the old city on the sea-front, which is now defined by the *Rondas*, occupying the ground where the fortifications once stood, and which is divided by the *Ramblas* into the older *Ciudad*, on the east, and the more modern *Arrabal*, on the west. The special character of Barcelona lies in the association within a clearly delimited area of gardens of luxuriant vegetation, factories and other apparatus of industrial life, and the merchant shipping of a busy port.

The *Ciudad* is the old Barcelona, built round the Roman *Barcino* which stood on the *Monte Taber*, a narrow tongue of rather higher ground near the present cathedral. In the interior of the *Ciudad* are the architectural treasures left to Barcelona—the Plaza del Rey; the Gothic cathedral, with the tomb of Santa Eulalia, the patron saint of the city, and with magnificent 15th century stained glass windows; the church of Santa Maria del Mar and many public buildings. The fine Plaza de Palacio, the centre of the city's maritime activities, and the Plaza Real, in the centre of the business area, lie inside, but near the edge of, the *Ciudad*; the Plaza de Catalonia, just outside and at the end of the *Ramblas*, is the chief centre of Greater Barcelona. The narrow, irregular streets of the old quarter were broken through in the 19th century by the Calle de Fernando VII. and its continuations, and more recently by the *Viá Layetana* and other avenues; it seems probable that the mediaeval ground-plan, so long conserved, will soon be unrecognizable. The stream-bed which formerly bounded the *Ciudad* on the west was covered over in the first half of the 19th century and the interior wall dividing the *Ciudad* and the *Arrabal* gradually demolished; thus the *Ramblas* came into existence, now the chief artery of social life.

The *Arrabal*, although it has lain within the city bounds since 1350, was not built over until the second half of the 18th century.

The *Ciudad* and *Arrabal* were formerly surrounded by a strong line of ramparts, and dominated by a citadel on the north-east, erected in 1715 by Philip V.; this restriction on development was removed by the destruction of the ramparts, authorized in 1854 and completed by 1868. In the later year, too, the citadel was destroyed during a revolt; the ground which it formerly covered was laid out in gardens on the occasion of the exhibition of 1888, and has now become the City park. To the east, on the tongue of land that helps to form the port, the suburb of Barceloneta was laid out between 1752 and 1775 in rectangular blocks of uniform, two-storied houses by order of the Marqués de la Mina, the commandant of the port. From 1864 onwards the rapidly increasing population of Barcelona poured out to the north-west, into the *Ensanche*, planned by the government engineer Cerdá. This quarter suffers, however, from the lack of organic connection both with the old town and with possible lay-outs for the outer areas. Beyond the *Ensanche*, the suburbs of Sans, Las Corts, San Gervasio, San Martín de Provensals and San Andrés de Palomar were added to the city between 1897 and 1904, the suburb of Horta, lying behind the projecting Montaña Pelada, before 1908, and that of San Vicente de Sarriá in 1922. The Pedralbes palace, built by public subscription as a royal residence on the lower slopes of the hills near Sarriá, was presented to King Alfonso on the occasion of his visit to Barcelona in 1924. Communications within the municipal area were improved by the opening in Dec. 1924 of a tube railway, and in Dec. 1925 of a line of the Metropolitan railway, linking up the suburbs of Gracia and San Gervasio. A series of improvements now being carried out, which

include the construction of a new terminal station of the M.Z.A. railway, intended to be one of the largest railway stations in Europe, are related to the long-postponed universal exhibition for which the buildings are now being erected on the lower slopes of Montjuich. Much of the hillside has now been converted into a fine park, with terraced gardens, an open air theatre and a stadium.

The educational institutions of Barcelona have from an early period been numerous and important. The university (*Universitat Literaria*), which was originally founded in 1430 by the magistracy of the city, and received a bull of confirmation from Pope Nicholas V. in 1450, possessed at that time four faculties and 31 chairs all endowed by the corporation. It was suppressed in 1714, but restored in 1841, and now occupies an extensive building in the new town; 3,575 students, including 403 women, attended the various faculties in 1923-24. There are, besides, an academy of natural sciences, a college of medicine and surgery—confirmed by a bull of Benedict XIII. in 1400—and an academy of fine arts. The principal charitable foundations are the Casa de Caridad or house of charity, the general hospital, dating from 1401, and the founding hospital. The principal civic and commercial buildings are the Casa Consistorial, a fine Gothic hall (1369-78), the Lonja or exchange (1383), and the Aduana or custom-house (1792). At the seaward end of the Ramblas are the picturesque Atarazanas or arsenals, finished about 1243, and now marked for total destruction. Remains of the former royal state of Barcelona are found in the Palacio Real of the kings of Aragon and the Palacio de la Reina.

Port.—The port of Barcelona, at first little more than an open roadstead, was improved in 1474 by the construction of a mole, the Moll de Santa Creu, but the harbour proper dates from the 17th century. It includes now an outer and inner harbour; the outer harbour is protected by two breakwaters of which the eastern is at present being greatly extended, and is entered by a channel 33ft. deep, the inner harbour can usually provide accommodation alongside the quays for vessels drawing 24 to 27ft. The floating dock will shortly be able to admit vessels of 10,000 tons. From 1873 the work of extension and improvement was carried on systematically, with the addition of new quays, greater storage room, and better means for handling cargo. After 30 years of steady development, further plans were approved in 1903. At this time the port included an inner harbour, with a depth of 18 to 30ft. at low tide, and an outer harbour with a depth of 20 to 35ft. In 1926, 3,187 steamers engaged in foreign trade, of a total net tonnage of 3,736,104, entered the port. Of these steamers 1,865 were Spanish, 324 Italian and 184 British; the respective tonnages were 1,428,530; 965,313; 339,933. A competition was opened in 1927 for the lay-out of a free zone in the triangular area, on the left bank of the Llobregat, south of the Barcelona-Villanueva railway; the zone will be entered by a channel inside the western breakwater. The air port of Barcelona, situated at present on the coast to the west of the mouth of the Llobregat, is an intermediate station on the French Latécoère line between Toulouse and Rabat, and on the Deutsche Lufthansa route from central Europe to Madrid. The port is now being transferred to a site farther inland and direct services with Valencia, Majorca and Italy are being established.

As a commercial city, Barcelona is the centre for the entire industrial area of Catalonia, which has its warehouses here. As an industrial city, it is characterized both by the great variety of its manufactures and by the amount of almost domestic manufacture, carried out in small workshops. The textile industry, especially the cotton industry, revived in 1746, is the most important, but the engineering works, including works for the construction of rolling stock for the railways, employ large numbers of people. Comestibles, raw materials and combustibles form the greater part of the imports, but this great manufactory also imports a considerable quantity of foreign manufactured goods. The principal exports are wine, olive oil, silk, cork, sandals, fertilizers, woollen and cotton goods, paper, etc.

History.—During the Roman period *Barcino*, a town of the Lacetani, raised to the rank of a colony under the name of *Julia Faventia* (afterwards *Augudi* and *Pia*), gradually replaced Tar-

racó (Tarragona) as a seaport. The *Bardjalu* of the Muslims, who captured it in 713, it became, after its reconquest by the Franks in 801, the chief town of the *Marca Hispanica* and, by the end of the 9th century, of the independent countship of Barcelona with recognized supremacy over its neighbours. The union in 1137 of Catalonia and Aragon was followed by the rise to political importance of the wealthy merchant class, from which were elected, at first exclusively, the members of the municipal council (*Conseil de Cent*) of Barcelona. Barcelona now became one of the foremost trading cities of the Mediterranean, the rival of Genoa and Venice, and its maritime code, *Libro del Consulado del Mar*, dating from the late 13th century, was for long widely recognized as authoritative. By 1479, the date of the union of Aragon with Castile, the city had extended its direct jurisdiction by the technical inclusion within the municipality of protected areas scattered over eastern Spain, and exercised a virtual hegemony over the rest of the seaboard of Aragon; in municipal politics a democratic tradition had been established by the entry to the council, and final predominance there, of representatives of the popular classes; marked independence of the central authority had already been shown by the successful resistance of the city to John II. of Aragon during the ten years ending in 1473. The relations of Barcelona with the new central government were prejudiced by the monopoly of the American trade granted to Andalusia, which persisted until 1778. In 1640 a flirtation with France and the revival in favour of Louis XIV. of the title of "Count of Barcelona" were illustrative of a tendency to play off a third party against Madrid rather than of any serious leanings towards France. During the War of the Succession Barcelona was taken in 1705 by the English under the earl of Peterborough, and the Archduke Charles was enthusiastically welcomed by the population, who paid the price of their enthusiasm when the *Conseil de Cent* was abolished by Philip V. after the recapture of the city in 1714. By this and by the suppression of the Catalan *fueros* in general, relations with Madrid were further embittered. No permanent traces were left of the French occupation of Barcelona between 1809 and 1813. In the modern period since 1815, the history of Barcelona has been marked by episodes indicative of social, industrial or political unrest, the combination of different forms of unrest in one complex movement being characteristic of the city. Specially serious were the uprisings of 1835, when 11 convents were destroyed and of the "tragic week" in 1909, when over 60 churches and religious buildings disappeared from the city's architectural inheritance. The infantry committees of defence had their headquarters here in 1916, and it was here that the movement began which led to the establishment of the military directory in 1923. The evolution of the labour movement from the earlier, pacific phase of the General Workers' Union (*Unión General de Trabajadores*), founded at the second Barcelona Congress in 1888, to the phase characterized by the terrorist action of the *Sinducato único* led to the revolutionary strikes of 1919 and 1920. Barcelona is also the headquarters of the Catalan separatist movement and of the movement for regional autonomy, partially satisfied by the creation of the semi-autonomous *Mancomunidad*, now suppressed, of which it was the head.

See F. Carreras y Candi, "La Ciutat de Barcelona," in *Geografia General de Catalunya* (1909); O. Jurgens, *Spanische Städte* (1926, Bibl.). For an authoritative description, geographical, historical and technical, of the port of Barcelona, see the *Dock and Harbour Authority*, May 1925, pp. 195 *et seq.* art. by José Aixelá.

BARCELONA, a town and port of Venezuela, capital of the State of Anzoátegui, on the Neveri river, 3m. from its mouth and 12m. by rail from the port of Guanta, which competes with the river port in the trade of this district. Pop. (1920) 10,883. Having a mean annual temperature of 80° F, the town has the reputation of being unhealthy. There are salt works and important coal deposits in its vicinity, the latter at Naricual and Capiricual, 12m. distant by rail. The adjacent country is fertile, and exports coffee, sugar, cattle and coal. The town dates from 1637, when it was situated at the foot of the Cerro Santo a few miles inland and was called Nueva Barcelona; it was moved to its present site in 1671. Its position at the point where the llanos come right to the sea makes it a natural outlet for a large district on the plains.

BARCELONNETTE, town, department of Basses-Alpes, south-east France. Pop. (1926) 1,947. Situated at a height of 3,717ft. on the right bank of the Ubaye river, it is in a fertile valley surrounded by villas, built by those who have made their fortune in Mexico, and are locally known as *les Américains*. The town itself is composed of a long street which is really the road from Grenoble to Cuneo over the Col de l'Argentière (6,545ft.). The town takes its name from the counts of Barcelona, to which family belonged Raymond Berenger IV., count of Provence, who refounded the town in 1231. It belonged to Savoy 1388–1713, since when it has belonged to France.

BARCLAY, ALEXANDER (c. 1476–1552), British poet, author of the *Ship of Fools*. His nationality is a matter of dispute, but William Bulleyn, who was a native of Ely, and probably knew him when he was in the monastery there, asserts that he was born "beyond the cold river of Twede." At some time between 1493 and 1507, he became chaplain of the college of St. Mary Ottery, Devonshire. Here he made his version of Sebastian Brant's *Ship of Fools*, and even introduced his neighbours into the satire:

For if one can flatter, and beare a Hauke on his list,
He shall be parson of Honington or Cist.

Later on he became a monk in the Benedictine monastery of Ely. In this retreat he probably wrote his eclogues, but in 1520, "Maistre Barkleie, the Blacke Monke and Poete" was desired to devise "histoires and convenient raisons to florisshe the buildings and banquet house withal" at the meeting between Henry VIII. and Francis I. at the Field of the Cloth of Gold. He at length became a Franciscan monk of Canterbury. It is presumed that he conformed with the change of religion, for he retained under Edward VI., the livings of Great Baddow, Essex, and of Wokey, Somerset, which he had received in 1546, and was presented in 1552 by the dean and chapter of Canterbury to the rectory of All Hallows, Lombard street, London. He died shortly after this last preferment, at Croydon, Surrey, where he was buried on June 10, 1552. All the evidence in Barclay's own work goes to prove that he was sincere in his reproof of contemporary follies and vice, and the gross accusations which John Bale brings against his moral character may be put down to his hatred of Barclay's cloth.

The *Ship of Fools* (*The Shyp of Fols of the Worlde*, first printed 1509) was the starting-point of a new satirical literature. It differs entirely from the allegorical satires of the preceding centuries. The figures are no longer abstractions; they are concrete examples of the folly of the bibliophile who collects books but learns nothing from them, of the evil judge who takes bribes to favour the guilty, of those eager to follow the fashions, of the priests who spend their time in church telling "gestes" of Robin Hood and so forth. The spirit of the book reflects the general transition between allegory and narrative, morality and drama. The poem is written in the ordinary Chaucerian stanza, and in language which is more modern than the common literary English of his day.

Certaine Ecloges of Alexander Barclay, Priest, written in his youth, were probably printed as early as 1513, although the earliest extant edition is that in John Cawood's reprint (1570) of the *Ship of Fools*. Barclay's pastorals contain many pictures of rustic life as he knew it. He describes, for instance, the Sunday games in the village, football, and the struggle for food at great feasts; but his eclogues were, like his Italian models, also satires on social evils.

His other works are: *The Castell of Laboure* (Wynkyn de Worde, 1506), from the French of Pierre Gringore; the *Introductory to write and to pronounce Frenche* (Robert Copland, 1521); *The Myrrour of*

Good Maners (Richard Pynson, not dated), a translation of the *De quatuor virtutibus* of Dominicus Mancinus; *Cronycle compyled in Latyn* by the renowned Sallust (Richard Pynson, no date), a translation of the *Bellum Jugurthinum*; *The Lyfe of the glorious Martyr Saynt George* (R. Pynson, c. 1530). *The Lyfe of Saynt Thomas*, and *Haythons Cronycle*, both printed by Pynson, are also attributed to Barclay, but on very doubtful grounds.

See T. H. Jamieson's edition of the *Ship of Fools* (1874), which contains an account of the author and a bibliography of his works; J. W. Fairholt's edition of *The Cytizen and Uplondyshman* (Percy Soc. 1847), which includes large extracts from the other eclogues; and Dr. Fedor Fraustadt, *Über das Verhältnis von Barclays Ship of Fools zu den lateinischen, französischen und deutschen Quellen* (1894).

BARCLAY, JOHN (1582–1621), Scottish satirist and Latin poet, was born at Pont-à-Mousson, where his father William Barclay held the chair of civil law. His mother was a Frenchwoman of good family. His early education was obtained at the Jesuit college. While there, at the age of 19, he wrote a commentary on the *Thebaid* of Statius. In 1603 he crossed with his father to London, but in 1605 he was again in Paris, where he married a French wife, Louise Debonaire. His *Sylvae*, however, was printed in London in 1606, and he remained in London until 1616. He then went to live in Rome, where he died.

His *Satyricon* (1603–14), a severe satire on the Jesuits, is modelled on Petronius. His best-known work is the *Argenis*, a long romance, with a monitory purpose, on the dangers of political intrigue. Most of the innumerable editions are supplied with a key to the characters and names of the story. It is of historical importance in the development of 17th century romance. Barclay's shorter poems, in two books, were printed in the *Delitiae Poetarum Scotorum* (Amsterdam, 1637, i. pp. 76–136). In the dedication to Prince Charles of England, he refers to his earlier publication, the *Sylvae*.

BIBLIOGRAPHY.—See, for the best account of Barclay, the preface by Jules Dukas in his bibliography of the *Satyricon* (1889). For the *Argenis*, see the dissertations by Léon Boucher (1874), and Dupond (1875). The *Icon Animorum* (the so-called 4th part of the *Satyricon*) was Englished by Thomas May in 1631 (*The Mirrour of Mindes, or Barclays Icon Animorum*).

BARCLAY, JOHN (1734–1798), Scottish divine, left the Scottish Church in 1772 and founded congregations at Sauchyburn, Edinburgh, and London. His followers were sometimes called Bercans, because they regulated their conduct by a diligent study of the Scriptures (Acts xvii. 11). They hold a modified form of Calvinism.

His works, which include many hymns and paraphrases of the psalms, and a book called *Without Faith, without God*, were edited by J. Thomson and D. Macmillan, with a memoir (1852).

BARCLAY, ROBERT (1648–1690), an apologist of the Society of Friends, was born at Gordonstown, near Elgin, Scotland, on Dec. 23 1648, the son of Col. David Barclay (1610–86), who had served under Gustavus Adolphus. Robert was educated at the Scots college in Paris, and after his return to Scotland joined the Society of Friends. A public discussion on his *Theses Theologicae*, printed in English, Latin, French and Dutch, was held at Aberdeen (March 14 1675). Barclay's great work, *An Apology for the True Christian Divinity held by the Quakers* (1678), was written in defence of his *Theses*, and is the first reasoned analysis of Quaker doctrine. Barclay himself experienced to some extent the persecutions inflicted on the new society, and was several times thrown into prison. He travelled extensively in Europe (once with Penn and George Fox), and had several interviews with Elizabeth, princess palatine. In later years he had much influence with James II., who as duke of York had given to 12 members of the society, under the leadership of Penn, a patent of the province of East New Jersey, Barclay being made nominal governor (1682–88). He is said to have visited James with a view to making terms of accommodation with William of Orange, whose arrival was then imminent. He died on his estate at Vry, near Aberdeen, on Oct. 3 1690. His wife, née CATHERINE GORDON, who was also a Friend, lived until Dec. 14 1722.

BIBLIOGRAPHY.—See Barclay's collected works under the title of *Truth Triumphant* (1692; 2nd ed. 1717–18); and M. C. Cadbury, *Life of Robert Barclay* (1912).

BARCLAY, SIR THOMAS (1853–), English lawyer, was born in Dunfermline, Scotland, and after studying at the

AFTER A WOODCUT IN SALLUST, PRINTED BY RICHARD PYN-ON, LONDON, 1520

BARCLAY PRESENTING HIS TRANSLATION OF SALLUST TO HIS PATRON, THE DUKE OF NORFOLK

universities of London, Paris and Jena, went to Paris as a correspondent of *The Times* in 1876. He was called to the bar (1881), and in 1882 resigned from *The Times* in order to study French law practice. From 1900 onwards he was constant in his advocacy of cordial Franco-British relations. In 1903 and 1904 he visited the United States and advocated an Anglo-American treaty of arbitration and conciliation, and in Feb. 1905 visited Berlin, at the invitation of the Associated Chambers of Germany, with a view to promoting improved relations with that country. He was elected to parliament as Liberal member for Blackburn in 1910. Amongst his numerous publications on international law and relations may be mentioned: *Problems of International Practice and Diplomacy* (1907); *International Law and Practice* (1917); *New Methods for Adjustment of International Disputes* (1918); *Le Président Wilson et l'évolution de la politique étrangère des États-Unis* (1918).

BARCLAY, WILLIAM (1546–1608), Scots jurist, born in Aberdeenshire in 1546. He was educated at Aberdeen university, went to France in 1573, and studied law under Cujas, at Bourges, where he took his doctor's degree. Charles III., duke of Lorraine, appointed him professor of civil law in the newly-founded University of Pont-à-Mousson, and also counsellor of state and master of requests. In 1603 he was obliged to quit France for England, having incurred the enmity of the Jesuits by his opposition to their proposal to admit his son John (*q.v.*) into their society. He was offered preferment by King James on condition of joining the Church of England. He refused, and returning to France in 1604, was appointed professor of civil law at Angers, where he died (1608). His principal works were *De Regno et Regali Potestate*, etc. (1600), a defence of the rights of kings, in which he refutes George Buchanan, "Junius Brutus" (Hubert Languet) and Jean Boucher; and *De Potestate Papae*, etc. (London, 1609), in opposition to the papal claim of temporal power which called forth a reply from Bellarmine; also commentaries on titles of the Pandects.

BARCLAY DE TOLLY, MICHAEL ANDREAS, called by the Russians MICHAEL, PRINCE BOGDANOVICH (1761–1818), Russian field-marshal, was born at Luhde-Grosshof, Livonia, on Dec. 27, 1761, of a Scottish family which had settled in Russia in the 17th century. He entered the Russian army at an early age. In the war of 1806 against Napoleon, Barclay took a distinguished part in the battle of Pultusk and was wounded at Eylau, where his conduct won him promotion to the rank of lieutenant-general. In 1808 he commanded against the Swedes in Finland, and in 1809 by a rapid and daring march over the frozen Gulf of Bothnia he surprised and seized Umeo. In 1810 he was made minister of war, and he retained the post until 1813. In 1812 Barclay was given command of one of the armies operating against Napoleon. After he was defeated at Smolensk he resigned his command and took a subordinate place under the veteran Kutusov. Barclay was present at Borodino, but left the army soon afterwards. In 1813 he was re-employed in the field and took part in the campaign in Germany. After the battle of Bautzen he was reinstated as commander-in-chief of the Russian forces, and in this capacity he served at Dresden, Kulm and Leipzig. After the last battle he was made a count. He took part in the invasion of France in 1814 and at Paris received the bâton of a field-marshal. In 1815 he was again commander-in-chief of the Russian army which invaded France, and he was made a prince at the close of the war. He died at Insternburg, in Prussia, on May 26, 1818.

BARCLAYS BANK LIMITED. The history of Barclays Bank as a British limited company dates from 1896, although the institutions now embodied in it were established at much earlier dates. The banking firms which took the lead in forming the limited company were Barclay, Bevan, Tritton, Ransom, Bouverie & Co., of London and Brighton (whose business was in existence prior to 1694), Gurney & Co. of Norwich (dating back to about 1650), and Jonathan Backhouse & Co. of Darlington (dating back to 1774). An agreement was entered into between these three firms for the formation of a joint stock company, while supplementary agreements were arranged with other firms, the combination, comprising 20 banks in all, being

registered as Barclay & Company, Limited, with the head office at 54, Lombard street, London, upon which site the business of Barclay, Bevan, Tritton & Co. and its predecessors had been conducted since 1728. The first published balance sheet (1896) showed a paid-up capital of £2,000,000, a reserve of £1,000,000 and deposits of £26,170,423.

Further amalgamations quickly followed, mainly owing to the desire to extend the Bank's operations to practically all areas in England and Wales and to the need for keeping in line with the large scale amalgamations among industrial units, which, partly as a result of the World War, have been constantly taking place. No fewer than 42 banking firms and companies have been, since 1896, merged in Barclays Bank, Limited, to which title the name of the undertaking was altered in 1917. The firms thus eventually combined included the names of many famous British bankers, notably those of Barclay, Bevan, Gurney and Backhouse.

The first reference to the name of Barclay in connection with the Bank occurs in 1736, when Joseph Freame, son of John Freame—a goldsmith and the founder of the London business—took into partnership his brother-in-law, James Barclay and the family has been connected with the business ever since. The Barclays are descended from Robert Barclay of Ury, Scotland. The Bevan family are of Welsh origin. Timothy Bevan married the daughter of David Barclay, son of Robert Barclay of Ury, and became the father of Silvanus Bevan, who joined the Bank in 1767. The Gurney family came to England with William the Conqueror. It is recorded that Francis Gurney acted as banker in the reign of James I., and in 1775, John and Henry Gurney, descendants of Francis Gurney, established the Norwich Bank as a separate business, while a later partner—Richard Gurney—became associated by marriage with the Barclays of Lombard street. The Backhouses were linen and worsted manufacturers, who were doing a banking business in conjunction with their regular trade, before they started the Bank as a separate and independent institution in 1774.

On the incorporation of Barclays Bank in 1896, Mr. Frederick Craufurd Goodenough was appointed secretary of the company, and became general manager in 1903; in 1917 he succeeded Mr. F. A. Bevan as chairman. At the end of 1927, the total deposits of Barclays Bank and its affiliations amounted to over £400,000,000.

BARCOCHEBA, BAR-COCHAB or **BAR KOKBA** ("son of a star"), the name given in Christian sources to the leader in the Jewish revolt against Rome in the time of Hadrian (A.D. 132–135). The name does not appear in the Roman histories. In Rabbinic sources he is called Bar (Ben) Kosiba (son of deceit). At first the insurgents were successful, although they did not succeed in capturing Jerusalem; they struck coins in the name of Simeon, prince of Israel, and Eleazar the priest, and persecuted the Christians, who refused to join the revolt. But, under the command of Julius Severus, the strongholds which they had captured were successively reduced. The end came with the fall of Beth-thar (Bethar), (A.D. 135), where Barcocheba was slain.

See articles **Jews and PALESTINE, History**; Eusebius *H.E.* iv. 6; Dio Cassius *xix.* 12–14; Schuerer, *Gesch. d. jud. Volkes*, 3rd ed. i. 682 *et seq.*; Derenbourg, *Hist. de la Palest.*, 423 *et seq.* (distinguishes Barcocheba from Simeon); Schlatter, *Gesch. Israels*, 2nd ed. 303 *et seq.*; also art. *s.v.* "Bar Kokba" in *Jewish Encyc.* (S. Krauss).

BARD, a word applied to the ancient Celtic poets. The name itself is not used by Caesar in his account of the manners and customs of Gaul and Britain, but he appears to ascribe the functions of the bards to a section of the Druids. Later Latin authors, such as Lucan (*Phar.* i. 449), used the term *Bardi* as the recognized title of the national poets or minstrels among the peoples of Gaul and Britain. In Gaul, however, the institution soon disappeared. The known relics belong almost entirely to Wales and Ireland. In Wales the bards formed an organized society, with hereditary rights and privileges. The whole society of bards was regulated by laws, said to have been first distinctly formulated by Hywell Dha, and to have been revised by Gruffydd ap Conan. At intervals great festivals were held, at which bards from the various districts met and contended in song, the umpires being generally the princes and nobles. Even after the conquest of Wales, these congresses or

Eisteddfodau continued to be summoned by royal commission, but from the reign of Elizabeth, the custom fell into abeyance. They have not been since summoned by royal authority, but were revived about 1822, and are held regularly at the present time. In modern Welsh, a bard is a poet whose vocation has been recognized at an *Eisteddfod*. In Ireland also the bards were a distinct class with peculiar and hereditary privileges. They appear to have been divided into three sections: the first celebrated victories and sang hymns of praise; the second chanted the laws of the nation; the third gave poetic genealogies and family histories.

See Ed. Jones, *Relics of the Welsh Bards* (1784); Walker, *Memoirs of the Irish Bards* (1786); Owen Jones, *Myvyrian Archaeology of Wales* (3 vols., 1801-07); W. F. Skene, *Four Ancient Books of Wales* (2 vols., 1868); P. W. Joyce, *Social History of Ancient Ireland* (2nd ed. 1913).

BARD-HORSES, horses covered with defensive armour as in mediaeval times (Fr. *Barde*): "occasionally the horses were covered all over with mail, or linen stuffed and quilted like the gambeson and adorned with rich embroidery" (Grose, *Military Antiquities*). In Spain the term refers to pack-animals.

BARDAIŞĀN (b. A.D. 154), an early teacher of Christianity in Mesopotamia, whose works, saving possibly the *Hymn of the Soul* in the *Acts of Thomas*, have perished. Bardaişān founded a school which was soon branded as heretical.

BARDOUX, AGÉNOR (1829-1897), French statesman, was a native of Bourges. In 1871 he was elected deputy of the National Assembly, and re-elected in 1876 and in 1877. In the chamber he was president of the group of the left centre, standing strongly for the republic but against anti-clericalism. After the *coup d'état* of May 16 1877, he was one of the leaders of the "363" (see FRANCE: History). In the republican chamber elected after May 16, he became minister of public instruction (Dec. 1877), and proposed various republican laws, notably on compulsory primary education. He resigned in 1879. He was not re-elected in 1881, but in Dec. 1882 was named senator for life. He wrote essays on *Les Légistes et leur influence sur la société française* (1878); *Le Comte de Montlosier et le Gallicanisme* (1881); and published in 1882 his *Dix Années de vie politique*.

BARDOWIEK, village, Prussian province of Hanover, Germany, 3m. N. of Lüneburg on the navigable Ilmenau. Founded (8th century) by Charlemagne as a bishop's see, it was the chief commercial city of North Germany till William the Lion destroyed it (1189). It derives its name from the Longobardi who came from the district. The Gothic church (c. 1400) includes remnants of a cathedral. The village is now purely agricultural.

BARDSEY, an island off the coast of Wales; area 444 acres, pop. (1921) 58. This continuation of the hills of Carnarvonshire has been separated from the mainland by a submergence of Pleistocene date whereby a famous tide race that endangers navigation has been formed. As a refuge in the far west of Wales the island has gathered many legends. It is associated with a supposed descent of Merlin with the 13 treasures of Britain, and there are remains of a monastery ascribed to the early Celtic Church and in particular to S. Cadvan; it is said that the remnant of the monks after the distribution of Bangor Iscoed fled hither. With these traditions, it became a goal of pilgrimage in the middle ages and the pilgrim roads in Carnarvonshire leading to Aberdaron, the port of embarkation, are dotted with sacred wells and other features. It has a lighthouse and a few houses of fisher-farmers and has been more or less patriarchally ruled by a "king." The island, nominally, has been counted in Pembrokeshire.

BAREBONE'S PARLIAMENT, in English history the name derisively given to the nominated parliament, summoned in the name of Cromwell after the expulsion of the Rump (April 20, 1653). At the fall of the "long parliament" some had advocated government through a nominated assembly, others through a smaller council. Cromwell inclined to the former view, and early in May letters were despatched in the name of the general and the council of the army to the Congregational Churches inviting suggestions of fit persons to sit in the new assembly. Answers had been received by the end of the month, and from the names submitted, the council of the army selected the final choice of 140

members—129 for England, 5 for Scotland, and 6 for Ireland. On July 4 the delegates met, assuming by a resolution of July 6 the name of parliament. The nick-name which has since tempered its dignity is derived from the name of one of its obscurer members—one Praise-God Barebone, or Barbon (*q.v.*).

From the first the members took a solemn view of their responsibilities, but their ardour for reform unhappily outran their ability for constructive thought. Sensible measures—such as the establishment of civil marriage before a justice of peace, the parochial registration of births, marriages and burials, and acts for the relief of creditors and the poor, and for the safe custody of lunatics—were countered by ill-advised attempts to abolish tithes, patronage, and the court of chancery, and, without any qualifications for the task, to codify the law. Cromwell was "more troubled now with the fool than with the knave." Reaction followed. The ideas afterwards embodied in "the Instrument of Government" had been first circulated at the time of the expulsion of the Rump. Revived privately in October, the plan was increasingly discussed in November. On Dec. 1, Cromwell rejected the draft containing the suggestion that he should take the title of king; his supporters, however, were determined to force his hand. On Dec. 12 a section of the parliament accused their opponents of destroying the clergy, the law and the property of the subject, and by a surprise motion resolved upon the abdication of the parliament. The majority thereupon waited on Cromwell and laid their resignation before him; while the recalcitrant minority was expelled from the house by the military. Next day Lambert produced "the Instrument of Government" (*q.v.*) which after two days' discussion established the system of Government which lasted until the Humble Petition and Advice (*q.v.*) of May 1657.

See H. A. Glass, *The Barbones Parliament* (1899); S. R. Gardiner, *History of the Commonwealth and Protectorate*, vol. ii. (1903).

BARÈGES, health resort of south-west France, department of Hautes-Pyrénées, in the valley of the Bastan, 25m. S.S.W. of Bagnères-de-Bigorre by road. Placed at a height of 4,100ft., it is a mere hamlet in the commune of Betspouey-Barèges, but is frequented from June-September for its nitrogenous waters and as a climbing-centre. The waters (90°-106°) first came into vogue after the visit of Mme de Maintenon in 1677. Barèges was formerly much exposed to avalanches, but embankments and plantations have partly averted the danger. The light silk and wool fabric called *barège* takes its name from the place, where it was first made.

BAREILLY or **BARELI**, a city and district of British India in the Rohilkhand division of the United Provinces. The city is situated on the Ramganga river, 812m. N.W. from Calcutta by rail. Pop. (1921) 129,459. The principal buildings are two mosques built in the 17th century; a modern fort overlooking the cantonments; the railway station, which is an important junction on the Oudh and Rohilkhand line; the palace of the nawab of Rampur, and the Government college. Bareilly is the headquarters of a brigade. The chief manufactures are furniture and upholstery.

The district of Bareilly has an area of 1,580 sq. miles. It is a level country, watered by many streams, the general slope being towards the south. The soil is fertile and highly cultivated, groves of noble trees abound, and the villages have a neat, prosperous look. A tract of forest jungle, called the *tarai*, stretches along the extreme north of the district, and teems with large game, such as tigers, bears, deer, wild pigs, etc. The river Sarda or Gogra forms the eastern boundary of the district and is the principal stream. Next in importance is the Ramganga, which receives as its tributaries most of the hill torrents of the Kumaon mountains; and after it come the Deoha and the Gumti. The population in 1921 was 1,013,875. Many of the Mohammedan families in the district claim descent from the Yusafzai Afghans, called the Rohilla Pathans, who settled in the country about the year 1720. During the Mutiny of 1857 the Rohillas took a very active part against the English; and they have frequently distinguished themselves by fanatical tumults against the Hindus. The district is irrigated from the Rohilkhand system of Government canals.

BARENTS, WILLEM (d. 1597). Dutch navigator, was born about the middle of the 16th century. In 1594 he left Amsterdam with two ships to search for a north-east passage to eastern Asia. He reached the west coast of Novaya Zemlya, and followed it northward, being finally forced to turn back when near its northern extremity. In the following year he commanded another expedition of seven ships, which made for the strait between the Asiatic coast and Vaygach island, but was too late to find open water; while his third journey equally failed of its object and resulted in his death. On this occasion he had two ships, and on the outward journey sighted Bear island and Spitsbergen, where the ships separated. Barents' vessel, after rounding the north of Novaya Zemlya, was beset by ice and he was compelled to winter in the north; and as his ship was not released early in 1597, his party left her in two open boats on June 13, and most of its members escaped. Barents himself, however, died on June 30 1597. In 1871 the house in which he wintered was discovered, with many relics, which are preserved at The Hague, and in 1875 part of his journal was found.

See *The Three Voyages of Barents*, by Gerrit de Veer, translated by the Hakluyt Society (1876) from de Veer's text (1598).

BARENTS SEA, the eastern portion of the northernmost Atlantic ocean, framed by north Norway, Finland and Russia on the south, by Novaya Zemlya on the east, by Franz Josef Land on the north, and by Spitsbergen and Bear island on the west. The English pioneer merchant-seamen, Willoughby and Chancellor (1553), sailed along the Murman coast of Russian Lapland and reached Kolguyef Island. The Dutch sailor Willem Barendsz (Barents) in 1594-97 crossed this sea several times, discovered Spitsbergen, and died on the east coast of Novaya Zemlya while wintering there. As the Barents Sea lies between lat. 70° and 80° N, the climate is very cold and only in the summer months and in the southern part of the sea can one sail without difficulty. Even in the height of summer the sea between Hope island (south-east of Spitsbergen) and Franz Josef Land is much encumbered with ice, which drifts southwards towards Bear island and westwards past South cape, Spitsbergen. The temperature of the air rarely goes far above 41° in summer, and in winter the cold is very severe with temperatures ranging from 14° to below zero. The water temperatures are more moderate and, even in winter, remain above 32° over considerable stretches of sea; this is true especially of the south side of the sea from North cape to the entrance into the White Sea, and here the water does not freeze, a fact which gives the Russian Murman coast special economic importance for Russia. Alexandrovsk, on Kola fjord, is an ice-free harbour because the last remnants of the Gulf Stream bring to this coast salt and relatively warm water of Atlantic origin from the west coast of Norway. In the northern part, however, the water is mostly Polar, relatively fresh and very cold. This cold water reaches to the neighbourhood of Bear island and, when south winds bring relatively warm air to this region, extensive fogs are formed over this cold water.

Every year the importance of the Barents sea in the matter of fisheries is increasing. In the southern parts with their warmer water a number of marketable fishes are found on the sea floor. There are Russian fisheries in territorial waters on the coast but in the open sea the catches are made mostly by English, Scottish and German trawlers; and these work even in winter in spite of great difficulties due to storms, and the long darkness. The development of the steam trawler industry in the Barents sea and in Icelandic waters is partly due to the diminished returns from the fishing of the North sea. When fishermen are going to the Barents sea they usually say that they are going to the White sea, but the actual White sea is reserved for Russian fisheries. The most important fish in the Barents sea are cod, haddock and plaice, also Norway haddock, and in 1925 the Barents sea yielded 5% of the total amount of these fish caught in the fisheries of north-west Europe. The average proceeds of a trawler's journey in 1925 gave 22,000kg. in the North sea, 45,000kg in the Iceland sea and 65,000kg. in the Barents sea. In view of their importance the fisheries of the Barents sea have been investigated scientifically along with survey of depths, bottom deposits, temperatures and cur-

rents and their biological relationships. A Norwegian (Nansen), Russians (Knipowitch and Breitfuss), and Germans (Mielck and Schulz) and others have led several expeditions, and there is a biological station at Alexandrovsk. The chief port for journeys to the Barents sea is the Norwegian harbour of Vardö.

Knipowitch, "Hydrologie des europäischen Eismeer" German in *Annalen der Hydrographie* (1905); B. Schulz and A. Wulfi, *Hydrograph. und planktol. Forschungen in der Barents Sea*, Deutsche Kommission für Meeresforschung, Band iv. (Berlin, 1928).

BARÈRE DE VIEUZAC, BERTRAND (1755-1841), French revolutionary, was born at Tarbes, in Gascony, Sept. 10 1755, and practised as an advocate before the *parlement* of Toulouse until he was sent by the estates of Bigorre to the states-general in May 1789. In the states-general he attached himself to the Constitutional Party. At this time he was less known as a speaker than as the author of the reports in a paper which he published, the *Point du Jour*. After the king's flight to Varennes Barère joined the Republican Party, though he kept in touch with the duke of Orleans, to whose natural daughter, Paméla, he was tutor. He was a judge in the new court of cassation from Oct. 1791 to Sept. 1792, and in the National Convention was deputy for Hautes Pyrénées. In the convention he at first voted with the Girondists, and attacked Robespierre, "a pygmy who should not be put on a pedestal"; but at the king's trial he voted with the Mountain for death "without appeal and without delay," closing his speech with a phrase which ran through Paris: "The tree of liberty could not grow were it not watered with the blood of kings." Barère was chosen a member of the Committee of Public Safety (April 7 1793). He joined the Robespierre Party, played an important part in the great Committee of Public Safety established on July 7, and voted for the death of the Girondists. Barère seems to have been animated throughout the Revolution by considerations of expediency. On the 9th Thermidor (July 27 1794) Barère hesitated; then he drew up the report outlawing Robespierre. Nevertheless, in Germinal of the year III. (March 21-April 4, 1795), the Thermidorians decreed the accusation of Barère and his colleagues of the Terror, Collot d'Herbois and Billaud-Varenne, and he was sent to the Isle of Oléron. He was removed to Saintes, and thence escaped to Bordeaux, where he lived in concealment for several years. Barère was a secret agent under Napoleon I., exiled as a regicide at the Restoration, and a pensioner under Louis Philippe. He died, the last survivor of the Committee of Public Safety, on Jan. 13, 1841 (see also FRENCH REVOLUTION).

BIBLIOGRAPHY.—The *Mémoires de B. Barère . . . publiés par MM. H. Carnot . . . et David (d'Angers) . . . précédés d'une notice historique* (1824-44) are false, but contain valuable information; Carnot's *Notice*, which is very good, was published separately in 1842. See F. A. Aulard, *Les Orateurs de la Constituante* (1882); *Les Orateurs de la Convention* (2nd ed., 1905). Macaulay's essay on Barère (*Edinburgh Review*, vol. lxxix.) is eloquent, but incorrect.

BARETTI, GIUSEPPE MARC' ANTONIO (1719-1789), Italian critic, a member of the Johnson-Thrales circle, was born in Turin, and settled in London in 1751. With the exception of some years spent abroad between 1770 and 1776 the rest of his life was spent in London. He became acquainted with Johnson, Garrick and their circle, and was a constant visitor at Thrales's house in Streatham. He was brought to trial for murder in 1769, having stabbed a man who attacked him in the street, but was acquitted, Johnson and others giving evidence in his favour. His works include a *Dictionary and Grammar of the Italian Language* (1760), and *Lettere famigliari* (Eng. trans. 1770), highly praised by Johnson.

BARFLEUR, port of north-west France, department of Manche, 22½m. N.N.E. of Valognes. Pop. (1926) 1,081. In the middle ages Barfleur was one of the chief ports of embarkation for England. In 1120 the "White Ship," carrying Prince William, only son of Henry I., went down outside the harbour. About 2m. to the north is Cape Barfleur, with a lighthouse 233ft. high.

BARFURUSH, a town in the Persian province of Mazandaran, 36° 32' N. and 52° 42' E., situated in a low-lying district

on the eastern side of the River Babil. It is on the high-road from Tehran to the coast and about 15m. distant from the roadstead of Meshed-i-Sar on the shore of the Caspian sea. The population is variously estimated at 35,000-40,000, of whom nearly 1,000 are Jews. The Babil is crossed at Barfurush by a fine masonry bridge. The town obtained importance during the reign of Fath Ali Shah, although Abbas I. had previously laid out a pleasure garden and summer palace south of the town the remains of which bear the name of Bagh-i-Shah. Barfurush is the most populous town of the province owing to its flourishing trade which, in normal times, is carried on all the year round. The bazaars, fully a mile in length, are crowded, but badly built, dark, and inferior to those in the great trading centres of Iran. Many streets are paved and the houses being built largely of burnt brick, give the town an unusual aspect of cleanliness.

The Babil is navigable for small craft up to Barfurush. At Meshed-i-Sar, the port of Barfurush and principal coast town of Mazandaran, steamers call weekly, anchoring in the roadstead and loading into river craft, as the bar is undredged. There is here a customs house, telegraph and post office, and a fishing station. The tonnage of trade in 1925-26 was 19,000, and the exports consisted mainly of raw cotton, dried fruits, oranges and lemons, rice, hemp and flax, and nuts.

BARGAIN AND SALE, in English law, a contract whereby property, real or personal, is transferred from one person—called the bargainor—to another—called the bargainee—for a valuable consideration; but the term is particularly used to describe a mode of conveyance of lands. The disabilities under which a feudal owner very frequently lay gave rise to the practice of conveying land by other methods than that of feoffment with livery of seisin, that is, a handing over of the feudal possession. That of "bargain and sale" was one. Where a man bargained and sold his land to another for pecuniary consideration, which might be merely nominal, and need not necessarily be actually paid, equity held the bargainor to be seised of the land to the use of the bargainee. The Statute of Uses (1535), by converting the bargainee's interest into a legal estate, had an effect contrary to the intention of its framers. For subsequent history and as to lease and release see CONVEYANCING.

BARGEBOARD, also **VERGEBOARD**, as sometimes written; in architecture, the exposed board running down the slopes of a projecting gable roof: a false rafter. Bargeboards are frequently decorated; in the Tudor period in England, and in the late Gothic period throughout Europe, they became extremely rich decorative features.

AN ORNAMENTED BARGEBOARD
A typical late English Gothic bargeboard, showing decoration by means of pierced tracery

BARGES and CANAL CRAFT. The name barge was originally applied to a small sailing vessel, but afterwards came into general use for a flat-bottomed boat used for carrying goods on inland waterways. On canals, barges are usually towed, but are sometimes fitted with some kind of engine; the men in charge of them are known as bargees. On tidal rivers barges are often provided with masts and sails ("sailing barges"), or in default of being towed they drift with the current, guided by a long oar or oars ("dumb-barges"). Barges used for unloading, or loading, the cargo of ships in harbours are sometimes called "lighters" (from the verb "to light," to relieve of a load). A State barge was a heavy, often highly ornamented vessel used for carrying passengers on occasions of State ceremonials. The college barges at Oxford are houseboats moored in the river for the use of members of the college rowing clubs.

Owing to the fact that there are over 40 different canals and rivers in the United Kingdom with locks of varying size, it is necessary to construct barges of many different shapes and sizes to navigate them, ranging, on the canals, from 20 to 160 tons. On the Continent of Europe, in France and Belgium, it is possible to

transport goods by canal at a much lower cost, for the locks are more or less standardized to enable barges of 260 to 280 tons to navigate nearly the whole of the waterways down to the principal sea ports.

Whereas most of the canal towing in bygone days was done by horses, the usual method now is either by steam or motor tug, or by barges fitted with semi-diesel engines, powerful enough to tow several other barges.

The common principle of all types of barges and lighters is to have as large a hatchway as possible and as small a deck area as possible, to save what is called "cupboard space" under deck in the hold, and to make for easy and quick handling, and therefore cheapness, in loading and discharging the cargoes.

The ordinary Thames river lighters range from 80 to 300 tons; in some instances they are 400 tons or more; on the Humber the craft carry from about 60 to 220 tons.

Barges worked in Antwerp and Rotterdam and the neighbouring rivers and docks are built up to 3,000 tons, which again makes for cheaper transport. These larger craft are built much lighter than English ones. As they are always afloat they need not be built so strongly as the barges that use English rivers, for the latter have to be strong enough to withstand loading and discharging whilst lying aground.

Thames lighters are a pattern to themselves, being "swim-ended" to assist the lighter's speed ("swim" meaning to glide). That is, the bottom of the lighter is turned up at both the forward and after ends to meet the deck at an angle of 35° to 40°, these ends are therefore called the forward swim and after swim, and the after swim has a "budget" (or what may be termed a "fixed rudder") worked down the centre, formed through the continuation of the keel plate to the extreme end of the swim; this is filled in up to the swim.

It is owing to this budget that these craft can navigate in a straight line whether being rowed (the lighterman's term is "to drive") or towed; a rudder becomes unnecessary. By a Thames regulation a tug must not tow more than six lighters, two abreast.

Many Types Needed.—The bargeowner, like the shipowner, has to fit his vessels to suit the trade of the times. Thus in the port of London we find barges fitted as insulator craft to load meat, butter, fruit, etc., out of the steamer that is fitted with refrigerators or chilling plant, while, again, there are tank barges fitted for the carriage of spirit. These craft have to be built and classed by Lloyds to pass the Port of London Authority rules. Then there are tank craft for vegetable oils, such as coconut or palm-kernel oil, which solidify when cold, these are fitted with steam coils to enable the oil to be heated for pumping when being discharged. The same applies to the tank craft used for heavy fuel oil and lubricating oil. Also special lighters are fitted with locking arrangements on their hatchways to protect dutiable goods; these have to be passed and licensed by the board of customs.

There is one point about the Thames-built wooden craft, both lighters and sailing barges, that is not found in other builds, the plank seams are always rabbited, that is, they have half lap joints fitted tight, which never need caulking. The steel barge, however, is rapidly displacing the wooden barge.

A large proportion of the craft on the Humber are rigged, and those fitted with the square sail are termed keels. Others, fitted with mainsail and foresail, are termed sloops. These are all fitted with leeboards the same as the Thames sailing barges. Prior to the World War quite a number of Humber craft, slightly larger than the sloops, and ketch rigged, used to work up and down to east coast sea ports and were called "billy boys," but these now seem to have been displaced by the Thames coasting barges.

Thames Sailing Barges.—The most interesting type of barge is no doubt the Thames sailing barge, which may be divided into two classes, the river sailing barge of say 80 to 180 tons, and the coasting sailing barge, which ranges up to 300 tons.

The river-craft ply in the Thames and estuary between Maidstone, Chatham, Faversham, Sittingbourne, and Southend to London. The coasting barges trade from London to the east and south coast ports, and all the near continental ports of Holland, Belgium, France and the Channel islands.

The coasting barges have replaced the schooner and ketch on the last-mentioned trade routes, as more economically worked vessels requiring fewer hands. A 300-ton barge requires only four hands against six or seven on a schooner of the same size. It is able to make a light passage without ballast, which a schooner cannot do, and draws three to four feet less water, which means that the coasting barge can get to a shallow berth, thus saving the cost of transshipment into smaller lighters and extra handling of goods.

The Thames coasting barge is sprit-sail rigged like the river barge, but whereas the river barges carry a mainsail, topsail, foresail, mizzen and flying jib, the coasting barge is rigged with a bowsprit to enable it to carry bowsprit jibs of various sizes to suit the weather conditions. Coasting barges also carry squaresails or balloon foresails, for running before the wind.

As will be seen from the pictures of the coasting barge, the sprit is a very long spar of about 60ft. or a trifle over, and about 13 to 14in. at the sling. It should also be noted that the main vang (the stays from the sprit end are called vangs) are worked from the sprit-end down to the quarter, and the rolling vangs are worked from the sprit-end to a chain plate on the side, at about the fore end of the fore hatch, so that when a barge is sailing in a seaway the lee rolling vang is always hove tight, and thus saves the sprit from rolling inboard when in a wind, or gybing when running dead before the wind. It is not often that a sprit is carried away at sea if the vangs are properly attended to; there are more accidents with gaff sails in a seaway than with sprit sails. Coasting barges are built with more sheer, higher coamings and bulwarks, and with other improvements to make them more seaworthy.

The leeboards on sailing barges are carried abreast of the main mast, which is about one-third of the barge's length from the stem, and answer the same purpose as the keel of a sailing yacht or other round-bottom sailing vessel, which is to stop the barge making leeway when sailing on a wind or reaching. The lee leeboard is kept down and the weather leeboard is hove up. When a barge is running before the wind both leeboards are hove up as they are not needed. A sailing barge captain gets used to his craft very quickly, and often improves her sailing qualities by shifting the leeboards a little forward or aft as needed. Should his craft be faint headed (*i.e.*, one that falls away too far on a wind) he shifts the leeboards slightly forward, or should his craft be hard headed

THE MOTOR-PROPELLED STEEL BARGE "LA CROSSE," THE FIRST IN THE UPPER MISSISSIPPI TO SUPERSEDE THE WOODEN BARGES THAT WERE TOWED, OR DRIFTED WITH THE CURRENT

(*i.e.*, if his vessel wants to come up into the wind when on a tight sheet) he shifts them slightly aft. Here again the design of the barge is a large factor in her sailing qualities.

The skill of sailing barge designing is to be able to work a flat bottom out to the bow and stern with a fair chine line to both fore and after runs. This chine in itself, if carried out properly, is a great assistance to the barge when sailing to windward. The Thames sailing barges all have a transome stern.

The Motor Barge.—The question has often been asked why English barge-owners have not adopted semi-Diesel engines to as great an extent as the Continental barge-owner. Perhaps the

greatest reason is that in the Thames and the Humber, such fine tidal rivers, under normal conditions the sailing barges or sloops can sail the journey in a tide, and lock in a dock or berth at a wharf by high water, whereas motor craft may do the journey two hours sooner but still have to wait until just before high water to dock or berth. In Holland, on the other hand, the canals are more suitable for the motor-barge and many small Dutch coasters are motor driven. Lighters lose a great deal of time waiting the convenience of ocean-going steamships.

American barge owners have followed the continental practice to some extent in the application of various motor drives, particularly in the use of the semi-Diesel engine. The most recent development is with the use of electric drives on barges operating in the Erie canal in New York State. Steel barges, with a cargo capacity of 2,800 tons, have been equipped with two 375 h.p., six-cylinder, four-cycle Diesel engines directly connected to a 250 k.w. generator operating at a speed of 250 revolutions per minute. An unusual feature is that both engines are installed with the axis of the crankshaft athwartships instead of longitudinally. The control of the barge, which can attain a speed of 10 m. per hour, is entirely in the hands of the captain in the pilot house. (W. J. E.)

BARGHEST, BARGUEST or BARGEST, the name given in the north of England, especially in Yorkshire, to a monstrous goblin-dog with huge teeth and claws. The Demon of Tedworth, the Black Dog of Winchester and the Padfoot of Wakefield all shared the characteristics of the Barghest of York. In Wales its counterpart was Gwyllgi, "the Dog of Darkness." In Lancashire the spectre-hound is called Trash or Striker; in Cambridgeshire and on the Norfolk coast, Shuck or Shock; in the Isle of Man Mauthe Doog. A Welsh variant is the *Cwn Annwn*, or "dogs of hell." The barghest was essentially a nocturnal spectre regarded as a portent of death. The derivation of the word barghest is disputed. "Ghost" in the north of England is pronounced "guest" and the name is thought to be *burh-ghest*, "town-ghost." Others explain it as Ger. *Berg-geist*, "mountain demon," or *Bar-geist*, "bear-demon," in allusion to its alleged appearance at times as a bear.

See Wirt Sikes, *British Goblins* (1880); *Notes and Queries*, first series, ii. 51; Joseph Ritson, *Fairy Tales* (1831), p. 58; *Lancashire Folklore* (1867); Joseph Lucas, *Studies in Nidderdale* (Pateley Bridge, 1882).

BARGIEL, WALDEMAR (1828–1897), German composer, was born in Berlin on Oct. 3, 1828, and died there on Feb. 23, 1897. He was a step-brother of Clara Schumann and studied at the Leipzig conservatoire. After teaching for some time in Berlin and Cologne he went to Rotterdam as conductor in 1865, and in 1874 returned to Berlin to teach at the high school for music there. As composer, Bargiel was a disciple of Schumann. He wrote a symphony in C, some choral music, and chamber music.

BAR GOLD, gold in the form of ingots. (See GOLD.)

BARHAM, RICHARD HARRIS (1788–1845), English humourist, better known by his *nom de plume* of THOMAS INGOLDSBY, was born at Canterbury on Dec. 6, 1788, and died in London on June 17, 1845. At seven years of age he lost his father, who left him a small estate, part of which was the manor of Tappington, so frequently mentioned in the *Legends*. At nine he was sent to St. Paul's school, but his studies were interrupted by an accident which shattered his arm and partially crippled it for life. In 1807 he entered Brasenose college, Oxford; in 1813 he was ordained and took a country curacy; he married in the following year, and in 1821 removed to London on obtaining the appointment of minor canon of St. Paul's cathedral. Three years later he became one of the priests in ordinary of the king's chapel royal, and was appointed to a city living. On the establishment of *Bentley's Miscellany* in 1837 he began to furnish the series of metrical tales known as *The Ingoldsby Legends*. In variety and whimsicality of rhymes these verses have hardly a rival since the days of *Hudibras*. But beneath this obvious popularity there lies a store of solid antiquarian learning, the fruit of patient, enthusiastic research, in out-of-the-way old books.

Barham's life was grave, dignified and highly honoured. His sound judgment and his kind heart made him the trusted counsellor, the valued friend and the frequent peacemaker; and he was intolerant of all that was mean and base and false.

A short memoir, by his son, was prefixed to a new edition of *Ingoldby* in 1847, and a fuller *Life and Letters*, from the same hand, was published in 1870.

BAR HARBOR, unincorporated village and township of same name in Hancock county, Maine, on Mount Desert island (*q.v.*), about 115m N.E. of Portland. The village is a port of entry. Steamers connect with various ports, and the Maine Central railroad operates a ferry from the mainland. The population of the town in 1920 was 3,662. It has been a famous and fashionable summer resort since about 1870, and is usually a summer rendezvous of the North Atlantic Squadron of the U.S. navy.

BAR-HEBRAEUS or ABU'L-FARAJ (1226-86), a maphriān or catholicus of the Jacobite (Monophysite) Church, he wrote in Syriac and Arabic numerous and elaborate treatises on theology, philosophy, science and history. The son of a physician of Jewish descent, Bar-Hebraeus was born at Malatiah on the upper Euphrates. In 1246 he was ordained at Tripolis as Jacobite bishop of Gūbās near Malatiah, and a year later was transferred to the neighbouring diocese of Lakabhin, whence in 1253 he passed to be bishop of Aleppo. In 1264 he was promoted by the patriarch Ignatius III. to be maphriān—the next rank below that of patriarch. It is mainly as an historian that Bar-Hebraeus interests the modern student. His great historical work—the *Syriac Chronicle*—is made up of three parts. The first¹ is a history of secular events from the creation to his own time, and in its later portions gives valuable information regarding the history of south-east Europe and western Asia. A compendium in Arabic of this secular history was made by Bar-Hebraeus under the title *al-Mukhtasar f'd-Duwal* (Compendious History of the Dynasties). The second and third parts² of the *Chronicle* deal with the history of the church, the second being mainly concerned with the patriarchate of Antioch, and the third with the eastern branch of the Syrian Church. Of special value to theologians is the *Aṣṣar Rāzē* (Storehouse of Secrets), a critical and doctrinal commentary on the text of the Scriptures, see J. Göttberger, *Bar-Hebräus und seine Schöhen zur heiligen Schrift* (Freiburg i. B. 1900).

See W. Wright's *Syriac Literature*, p. 268-281. Bar-Hebraeus's more important works are—(1) *Kēthābhā dhē-Bhābhāthā* (Book of the Pupils of the Eyes), a treatise on logic or dialectics, (2) *Hēwath Hēkhmēthā* (Butter of Wisdom), an exposition of the whole philosophy of Aristotle; (3) *Sullākā Haunānāyā* (Ascent of the Mind), a treatise on astronomy and cosmography, edited and translated by F. Nau (1899); (4) various medical works; (5) *Kēthābhā dhē-Ṣemhē* (Book of Rays), a treatise on grammar; (6) ethical works, (7) poems; (8) *Kēthābhā dhē-Thunnāyē Mēghāhēkhānē* (Book of Entertaining Stories), edited and translated by E. A. W. Budge (1897).

BARI (anc. **BARIVM**), an archiepiscopal see in Apulia, Italy, capital of province of Bari, on a small peninsula, 69m. N.W. of Brindisi by rail. Pop. (1815) about 15,000; (1901) 77,478, (1921) 109,990 (town), 114,754 (commune). The closely-built old town is on the peninsula to the north, and the new town to the south is laid out rectangularly. The former contains the cathedral of S. Sabino, begun in 1034, destroyed in 1156, and rebuilt in 1170-78: the exterior preserves in the main the fine original architecture, notably the dome and campanile; the church of S. Nicola was founded in 1087 to receive the relics of this saint, brought from Myra in Lycia, and now beneath the altar in the crypt. The façade is fine, and the interior, divided into three naves by columns, with galleries over the aisles, has fortunately not been restored. The church is one of the four Palatine churches of Apulia (the others being the cathedrals of Acquaviva and Altamura, and the church of Monte S. Angelo sul Gargano). The small church of S. Gregorio belongs also to the 11th century. The castle, built 1233-40 by Frederick II., and strengthened in the 16th century, lies on the west side of the old town. The old harbour lies on the east side of the peninsula, and the new (recently

enlarged) on the west. The imports in 1925 amounted to 309,652 tons and the exports to 65,105 tons. Trade for 1926 included 10,436 passengers, 371,297 tons of merchandise and 3,800 ships of total tonnage of 2,065,376. Bari is the home port of the Puglia line. In the new town is the Ateneo, containing the provincial museum, with pre-Hellenic collections, and a large theatre.

Bari is the seat of command of the IX. Army Corps, and the most important commercial town in Apulia. It manufactures olive-oil, soap, carbon sulphide, tiles, "oriental" carpets and playing-cards, and has a large iron foundry and important flour-mills. In Roman times Barium was the junction between the coast road and the Via Traiana. Its harbour, mentioned as early as 180 B.C., was the principal one of the district, as at present, and was the centre of a fishery. It became in 852 a seat of Saracen power, and in 885 the residence of the Byzantine governor of Apulia. In 1071 it was captured by Robert Guiscard. Some of the Norman crusaders crossed thence to Constantinople in 1096-97. In 1156 it was razed to the ground but acquired new prosperity under Frederick II. After this it was under various masters, last of all the Sforzas (1464-1557), and after the death of Bona Sforza, widow of Sigismund I. of Poland, it was assigned to Naples by arbitration of the Emperor. (See F. Carabellese, *Bari* [Arti grafiche, Bergamo, 1909]—well illustrated.)

BARIBA, a well-proportioned, long-headed people located in northern Dahomey (Parakou, Nikki, Kandi and the Atakora district of southern upper Volta). Their language is related to Kabre. They are independent and warlike, are cultivators and cattle-raisers, employing Fulani herdsmen. They live in extended family groups in walled villages, subject to a paramount chief.

See Delafosse, *Haut Sénégal Niger* (1912).

BARILI, a municipality (with administration centre and 21 barrios or districts) of the province and island of Cebu, Philippine Islands, on the Barili river, 2m. from its mouth and about 35m. S.W. of Cebu, the capital. Pop. (1918), 33,481, of whom 16,366 were males (no whites). Corn, sibucao, abacá (or Manila hemp) and various other products are raised. It is the commercial centre of the greatest corn-producing district of the Philippines. In 1918 it had 141 household industry establishments, with output valued at 43,000 pesos, and 12 schools, all public. The language is Cebu-Bisayan.

BARILLA, an impure soda, formerly used for the making of soda, soap and glass, but now employed very little. It was obtained from the ashes of the fleshy plant (*Salsola Soda*), called in Spanish *barrilla*, grown specially for this product along sea-shores in Mediterranean countries.

BARING, the name of a family of English financiers and bankers. The firm of Baring Brothers was founded by FRANCIS BARING (1740-1810), whose father, John Baring, son of a Lutheran minister at Bremen, had come to England and started a cloth manufactory at Larkbear, near Exeter. Francis Baring was born at Larkbear, April 18, 1740. In 1770, in conjunction with his brother John, Francis Baring established a banking-house in London, and before he died, in 1810, had so developed the business that he was regarded as the first merchant in Europe. He was for many years a director of the East India Company, and chairman in 1792-93, receiving a baronetcy for his services. From 1784-1806 he sat almost continuously in parliament as a Whig. He left five sons, of whom the eldest, SIR THOMAS BARING (1772-1848), was a well-known art-patron and collector. The control of the business passed to his second son, ALEXANDER (1774-1848), better known as Lord Ashburton (See ASHBURTON, ALEXANDER BARING.) After the death of Lord Ashburton in the year 1848 the affairs of the house were managed by THOMAS BARING (1799-1873), the son of Sir Thomas Baring. Thomas Baring represented Huntingdon in parliament from 1844 till his death. His elder brother, Sir FRANCIS THORNHILL BARING (1790-1866), sat for Portsmouth from 1826-65. From 1830-1841 he was chancellor of the exchequer, and from 1840-52 first lord of the Admiralty. In 1866 he was created Baron Northbrook, the barony being converted in 1876 into an earldom in favour of his eldest son, Thomas George Baring (1826-1904). The latter, the 1st earl of Northbrook, is best remembered as viceroy of India, which

¹Bedjan (Paris, 1890).

²Edited and translated by Abbeloos and Lamy (Louvain, 1872-77).

office he held from 1872-76, but his last public position was first lord of the Admiralty (1880-85). With the death of Thomas Baring, Edward Charles Baring (1828-97), son of Henry Baring, M.P., and grandson of Sir Francis Baring, became head of the firm of Baring Brothers, and in 1885 was raised to the peerage as Baron Revelstoke. The house of Baring then stood at the height of its prosperity. During the following years a large amount of English capital was advanced to the Argentine Republic, Barings undertaking the loans and guaranteeing the interest. Through the continued default of the Argentine government, Barings became seriously involved, their heavy obligations precipitating a general financial crisis. Towards the end of 1890 it became known that the firm was on the eve of suspending payment, with liabilities amounting to £21,000,000. The prompt action of the Bank of England, which in conjunction with the leading joint-stock banks of the United Kingdom took over these liabilities, averted further disaster, and the firm of Baring Brothers was subsequently reorganized as a limited company with a capital of £1,000,000. Besides those already referred to, various other members of the Baring family have achieved public distinction, notably Charles Baring (1807-79), bishop of Durham, and Evelyn Baring, 1st Earl of Cromer (q.v.).

See Sir B. Mallet, *The Earl of Northbrook, A Memoir* (1908); his *Correspondence* was edited by his son, the earl of Northbrook (1905).

BARING, MAURICE (1874-), English diplomat and author, the 4th son of the first Lord Revelstoke, was born in London, on April 27, 1874. Educated at Eton and Trinity college, Cambridge, he entered the diplomatic service in 1898, but resigned in 1904, and took to journalism. He acted as correspondent for the *Morning Post* in Manchuria (1904), Russia (1905-08), and Constantinople (1909); and for *The Times* in the Balkans (1912). During the World War he worked on the staff of the R.F.C. in France and at home, and his *R.F.C.H.Q., 1914-18* (1920) is an account of his experiences there. Besides various volumes of poems, parodies and critical essays, Baring wrote several novels, including *Cat's Cradle* (1925) and *Daphne Adecant* (1926), and published works on Russia, such as *The Russian People* (1911) and *The Mainsprings of Russia* (1914); in 1924 he edited the *Oxford Book of Russian Verse*. Other works by Baring are: *Gaston de Foix* (1903); *Letters from the Near East* (1909); *Diminutive Dramas* (1911); his *Poems* were published in two collections (1918 and 1920), and Messrs Heinemann published a uniform edition of his works (1925, etc.). See also L. Chaundy, *Bibliography of First Editions of the Works of Maurice Baring* (1925).

BARING-GOULD, SABINE (1834-1924), English novelist, was born at Exeter. After graduating at Clare college, Cambridge, he travelled, and later became in 1864 curate of Horbury, Yorkshire; then perpetual curate of Dalton, in the same county, in 1867; and in 1871 rector of East Mersea, Essex. On his father's death in 1872 he inherited the estate of Lew Trenchard, North Devon, where his family had been settled for nearly three centuries, and he exchanged his Essex living for the rectory of Lew Trenchard in 1881. He wrote books on many subjects—fiction, travel, history, folk-lore, religion, mythology, from 1854 onwards. His novel *Mchalah* (1880), the scene of which is laid on the east coast of England, was an excellent story.

Among others were *John Herring* (1883), a tale of the west country; *Court Royal* (1886); *Red Spider* (1887); *The Pennycomequicks* (1889); *Cheap Jack Zita* (1893); and *Broom Square* (1896), a Sussex tale. His popular contributions to the study of topography, antiquities and folk-lore included *Book of Were-wolves* (1895), *Curious Myths of the Middle Ages* (1866), *Curious Survivals* (1892). He produced many volumes of sermons and popular theology, and edited (1871-73) *The Sacristy*, a quarterly review of ecclesiastical art and literature. See his *Early Reminiscences* (1923).

BARINGO, a lake in Kenya Colony $0^{\circ} 46' N. 36^{\circ} 15' E$; situated 3,150 ft. above sea-level. It can best be reached from the railway at Nakuru, 78 miles away. The lake is about 18 miles long by 10 broad. It occupies a portion of the floor of the eastern branch of the Rift Valley, and has no outlet. To the north are the Karosi Hills; to the east the ground rises in terraces to the top of the Laikipia escarpment, while on the western

side of the valley are the Kamasia mountains. The lake is fed by several small streams from the neighbouring hills. The Tigrish and the Nyuki flow in from the south, through a low marshy country, which yields good crops of maize. The existence of the lake was first reported about 1850 by two German missionaries, Krapf and Rebmann. The first European to see it was Joseph Thomson in 1883. Native tradition says that the lake formerly occupied a much larger area.

BARISAL, a town of British India, headquarters of Backergunge district in Bengal, situated on a river of the same name. Pop. (1921) 26,744. It is an important centre of river trade, on the steamer route through the Sundarbans from Calcutta to the Brahmaputra. Barisal has given its name to a curious physical phenomenon, known as the "Barisal guns," the cause of which has not been satisfactorily explained. These are noises, like the report of cannon, frequently heard in the vicinity of Barisal and elsewhere which appear to come from the direction of the sea.

BARI-SPEAKING TRIBES. The territory of the Bari-speaking tribes lies to the south of the Dinka country, E. Africa, on both banks of the river and in form approaching a rectangle some 160m. in length extending southwards from lat. $6^{\circ} 5' N.$ and having a maximum breadth of some 90 miles. On the eastern bank it constitutes a relatively narrow strip, its southern extreme marching with the Madi, while eastward from north to south it borders upon the Beir and the Lotuko. The Bari-speaking tribes of this, the eastern, bank of the Nile are the Shir and the Bari proper, using the latter term in its restricted tribal sense. There are also Shir and Bari to the west of the Nile, and to the south of these the Kuku, while other Bari-speaking peoples lying west of these riverain tribes include, from north to south, the Mandari, the Nyambara, the Fajelu, the Nyefu and the Kakwa.

The true Bari of the eastern bank are dolichocephals, with a cephalic index averaging 73.5, and with a skin as dark as that of the Dinka. They are moderately tall, with an average stature of about 67½ in but "very tall" men are not uncommon. In contradistinction to these, the Bari-speaking tribes of the west bank are mesocephalic, and with the exception of the Mandari, who border on the Dinka and who have an average stature of nearly 69 in, they are some 3 in. shorter than the Bari of the eastern bank. The Bari dialects belong to the Bari-Masai sub-group of the Niloto-Hamitic group, their fellows within the sub-group being in the Sudan, Lotuko and in Kenya, Masai.

The social organization of the Bari is into a number of exogamous clans with male descent, and there are certain prohibitions, for the most part connected with animals or food, which each clan should observe. Knowledge with regard to the regulation of public life among the Bari is far from complete; there seems to be a rather complicated system, for besides chiefs and commoners there is a class that may provisionally be termed serfs. Chiefs are of two classes, rain-chiefs and "fathers of the land" (to translate literally the native term for the second class) who are specially concerned with cultivation and the safeguarding of the crops by magical means. The rainmaker is supreme in matters concerning rain, his office being hereditary and passing to his eldest son or in default to a sister's son. Generally each rainmaker and "father of the land" has a medicine-man attached to him, functions of the latter being those of the witch-doctor of the usual African type. (C. G. S.)

BARITONE or **BARYTONE**, a musical term for the male voice whose range lies between those of the tenor and of the bass (Ital. *baritono*, from Gr. *βαρύτρονος* deep sounding); also the name of an obsolete stringed instrument like the viola da gamba and of the small Bb or C saxhorn.

BARIUM, one of the metallic chemical elements included in the group of the alkaline earths (symbol, Ba, atomic number 56, atomic weight 137.37 [O=16]). It takes its name from the Greek *βαρύς* (heavy) on account of its presence in barytes or heavy spar which was first investigated in 1602 by V. Casciorolus, a shoemaker of Bologna, who found that after ignition with combustible substances it became phosphorescent, and on this account it was frequently called Bolognian phosphorus. In 1774 K. W. Scheele, in examining a specimen of pyrolusite, found a new

substance to be present in the mineral, for on treatment with sulphuric acid it gave an insoluble salt which was afterwards shown to be identical with that contained in heavy spar. Barium occurs chiefly in the form of barytes or heavy spar, BaSO_4 , and witherite, BaCO_3 , and to a less extent in baryto-calcite, baryto-celestine, and various complex silicates. The metal is difficult to isolate; Sir H. Davy tried to electrolyse baryta, but was unsuccessful; later attempts were made by him using barium chloride in the presence of mercury. In this way he obtained an amalgam, from which on distilling off the mercury the barium was obtained as a silver white residue. R. Bunsen in 1854 electrolysed a thick paste of barium chloride and dilute hydrochloric acid in the presence of mercury, at 100°C ., obtaining a barium amalgam, from which the mercury was separated by a process of distillation. A. N. Guntz reduced barium oxide by aluminium powder at 1200°C .; and C. Matignon reduced it in a vacuum at the same temperature by means of ferrosilicon (95% Si), barium of 98.5% purity distilling over. The metal when freshly cut possesses a silver white lustre, is a little harder than lead, and is extremely easily oxidized on exposure; it is soluble in liquid ammonia, and readily attacks both water and alcohol. Its specific gravity is 3.78.

Three oxides of barium are definitely known—the monoxide, BaO , the peroxide, BaO_2 , and a suboxide, obtained by heating BaO with magnesium in a vacuum to 1100°C . An oxide BaO_1 has also been described. The monoxide is formed when the metal burns in air, but is usually prepared by the ignition of the nitrate, oxygen and oxides of nitrogen being liberated. It can also be obtained by the ignition of an intimate mixture of the carbonate and carbon or barium carbide. It is a greyish coloured solid, which combines very energetically with water to form the hydroxide, much heat being evolved during the combination, on being heated in a current of oxygen it forms the peroxide, which at higher temperatures breaks up again into the monoxide and oxygen. The hydride, BaH_2 , is obtained by direct combination at high temperatures; it is volatile and less stable than calcium or strontium hydrides.

Barium hydroxide, Ba(OH)_2 , is a white powder that can be obtained by slaking the monoxide with the requisite quantity of water, but it is usually made on a large scale by heating heavy spar with small coal whereby a crude barium sulphide is obtained. This sulphide is then heated in a current of moist carbon dioxide, barium carbonate being formed, $\text{BaS} + \text{H}_2\text{O} + \text{CO}_2 = \text{BaCO}_3 + \text{H}_2\text{S}$, and finally the carbonate is decomposed by a current of superheated steam, $\text{BaCO}_3 + \text{H}_2\text{O} = \text{Ba(OH)}_2 + \text{CO}_2$, leaving a residue of the hydroxide. It is also made by electrolysis of a barium chloride solution, using a mercury cathode. Barium hydroxide is moderately soluble in cold water, readily soluble in hot water, the solution possessing an alkaline reaction and absorbing carbon dioxide readily. The solution, known as *baryta-water*, finds an extensive application in practical chemistry, being used in gas-analysis for the determination of the amount of carbon dioxide in the atmosphere; it is also used in organic chemistry as a mild hydrolysing agent. E. Fischer has used it as a condensing agent in the preparation of α - and β -acrolein dibromide. A saturated solution of the hydroxide deposits on cooling a hydrated form, $\text{Ba(OH)}_2 \cdot 8\text{H}_2\text{O}$, as colourless quadratic prisms, which on exposure to dry air lose seven molecules of water of crystallization. It is used as a depilatory in tanning.

Barium peroxide, BaO_2 , can be prepared as shown above, or in the hydrated condition by the addition of excess of baryta-water to hydrogen peroxide solution, when it is precipitated in the crystalline condition as $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$. These crystals on being heated to 130°C . lose water of crystallization and leave a residue of the anhydrous peroxide. In the Brin process for the manufacture of oxygen, barium dioxide was formed by heating barium monoxide with air at 700°C under pressure, and decomposed by lowering the pressure. (This process has been superseded by the fractionation of liquid air.) It is a white powder which is readily decomposed by dilute acids with the production of hydrogen peroxide.

Barium chloride, $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$, can be obtained by dissolving witherite in dilute hydrochloric acid, and also from heavy spar by ignition in a reverberatory furnace with a mixture of coal, limestone and calcium chloride, the barium chloride being extracted

from the fused mass by water, in which it is readily soluble; it is almost insoluble in concentrated hydrochloric acid and in absolute alcohol. It can be obtained in the anhydrous condition by heating it gently to about 120°C . It has a bitter taste and is a strong poison. Barium bromide is prepared by saturating baryta-water, or by decomposing barium carbonate, with hydrobromic acid. It crystallizes as $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$, isomorphous with barium chloride. Barium bromate, $\text{Ba(BrO}_3)_2$, can be prepared by the action of excess of bromine on baryta-water. It crystallizes in the monoclinic system, and separates from its aqueous solution as $\text{Ba(BrO}_3)_2 \cdot \text{H}_2\text{O}$. On being heated it begins to decompose at 260 – 265°C . Barium chlorate, $\text{Ba(ClO}_3)_2$, is obtained by adding barium chloride to sodium chlorate solution; on concentration of the solution sodium chloride separates first; after further evaporation barium chlorate crystallizes out and can be purified by recrystallization. It can also be obtained by suspending barium carbonate in boiling water and passing in chlorine. It crystallizes in monoclinic prisms of composition $\text{Ba(ClO}_3)_2 \cdot \text{H}_2\text{O}$, and begins to decompose on being heated to 250°C . Barium iodate, $\text{Ba(IO}_3)_2$, is obtained by the action of excess of iodic acid on hot caustic baryta solution or by adding sodium iodate to barium chloride solution. It crystallizes in monoclinic prisms of composition $\text{Ba(IO}_3)_2 \cdot \text{H}_2\text{O}$, and is only very sparingly soluble in cold water.

Barium carbide, BaC_2 , is prepared by a method similar to that in use for the preparation of calcium carbide (see ACETYLENE). Barium sulphide, BaS , is obtained by passing sulphuretted hydrogen over heated barium monoxide, or better by fusion of the sulphate with small coal. It is a white powder which is readily decomposed by water with the formation of the hydroxide and hydrosulphide. The phosphorescence of the sulphide obtained by heating the thiosulphate is much increased by adding traces of uranium, bismuth or thorium salts before ignition.

Barium sulphate, BaSO_4 , is the most abundant of the naturally occurring barium compounds (see BARYTES) and can be obtained artificially by the addition of sulphuric acid or any soluble sulphate to a solution of a soluble barium salt, when it is precipitated as an amorphous white powder of specific gravity 4.5. It is practically insoluble in water (about two parts per million at 15°C), and is only very slightly soluble in dilute acids, it is soluble to some extent, when freshly prepared, in hot concentrated sulphuric acid, and on being cooled the solution deposits crystals of composition $\text{BaSO}_4 \cdot \text{H}_2\text{SO}_4$. It is used as a pigment under the name of "permanent white" or *blanc fixe*, and with zinc sulphide in "lithopone." It is also used for weighting paper.

Barium nitride, Ba_3N_2 , is obtained as an orange-yellow mass by passing nitrogen over heated barium amalgam or over the metal at 260 – 600°C , or by heating the amide, $\text{Ba(NH}_2)_2$, in a vacuum at 400 – 450°C . It is decomposed by water, and on being heated in a current of carbonic oxide forms barium cyanide (L. Maquenne), giving ammonia and baryta. Barium amide, $\text{Ba(NH}_2)_2$, is obtained by heating the metal in a current of dry ammonia at 200°C . or from a solution of a barium salt and potassium amide in liquid ammonia. Barium dissolves in liquid ammonia to give a deep blue solution of $\text{Ba(NH}_3)_6$.

Barium nitrate, $\text{Ba(NO}_3)_2$, is prepared by dissolving either the carbonate or sulphide in dilute nitric acid, or by mixing hot saturated solutions of barium chloride and sodium nitrate. It crystallizes in octahedra, having a specific gravity of 3.2, and melts at 597°C . It is decomposed by heat, and is largely used in pyrotechny for the preparation of green fire. Barium carbonate, BaCO_3 , occurs rather widely distributed as witherite (*qv*), and may be prepared by the addition of barium chloride to a hot solution of ammonium carbonate, when it is precipitated as a dense white powder of specific gravity of 4.3, almost insoluble in water. It is much more stable towards heat than calcium or strontium carbonates.

Barium and its salts can be readily detected by the yellowish-green colour they give when moistened with hydrochloric acid and heated in the Bunsen flame, or by observation of their spectra, when two characteristic green lines are seen. In solution, barium salts may be detected by the immediate precipitate they give on the addition of calcium sulphate (this serves to distinguish barium

salts from calcium salts), and by the yellow precipitate of barium chromate formed on the addition of potassium chromate. Barium is estimated quantitatively by conversion into the sulphate. For the relation of barium to radium, see RADIUM.

BARK or **BARQUE**, also **BARQUENTINE**: see NAUTICAL TERMS.

BARK-CLOTH, essentially a tropical and sub-tropical material, its manufacture and use being found from the Congo across Africa (including Madagascar); from the Malay peninsula through Indonesia and Melanesia to Easter island, reaching its highest perfection in Polynesia; and in the tropical regions of Central and South America. It is being ousted everywhere by the introduction of native or imported cloth, and among many tribes the art of making it is already lost. There is evidence of a far wider distribution in former times. In India the Laws of Manu ordained that a Brahman purposing to end his life in religious meditation in the forests should clothe himself in skins or bark-cloth; it is still made in the Garo hills and before the introduction of imported cotton clothes it was the usual dress of the Vedda of Ceylon. A Kayan of Borneo reverts to a strip of bark-cloth when in mourning; and in the Belgian Congo, if a Bushongo woman has lost several children, she puts on a mourning robe of bark-cloth. Folk tales of the Bushongo fix the traditional date (about 780) when bark-cloth garments superseded complete nudity. Among the Yao of Nyassaland the girls are dressed in bark-cloth during their initiation ceremonies. It was once made in New Zealand where the paper mulberry, not being indigenous, was cultivated, but both trees and industry are now dead.

The making of bark-cloth depends on several factors—the need of clothing, the existence of trees with suitable fibrous inner bark, and the discovery that this could be beaten out into "cloth." In Central America bark-cloth is common on the Mosquito coast; it provides loin-cloths for the men, skirts for the women and long sleeveless mantles for both sexes as waterproofs. In Brazil the "shirt tree" (a *Lecythis* allied to the "monkey-pot") provides a bark which needs little or no preparation. A length of the stem four or five feet long is cut off, the bark is peeled off in one piece, soaked, and with two holes cut for the arms, the shirt is made. But the typical bark-cloth trees are absent from the South American forests; the less civilized natives wear no clothing, while among the more civilized cotton weaving is universal. In Africa there are numerous kinds of *Ficus* which have suitably fibrous bark. Bark-cloth was the natural clothing and an important industry in Uganda up to the middle of the 19th century. It was man's work to plant and cultivate the bark-cloth trees and make the cloth, which was used both for their ample garments and for draping the house walls, and for fines. A thick kind was also used for bed-clothes; several layers one on the top of the other two or three feet high made excellently springy beds for kings and chiefs. The "paper mulberry" (*Broussonetia papyrifera*), which is extensively cultivated in the East for paper making, grows wild in Burma, China and most of Oceania, and various kinds of *Ficus* (*F. prolixa*, *F. tinctoria*, *F. bengalensis*, the banyan tree, and *F. religiosa*, the "sacred fig tree") as well as the breadfruit tree (*Artocarpus incisa*) are used for making bark-cloth in the islands of the Indian and Pacific oceans.

The method of making bark-cloth differed very little in the various islands. A suitable length of branch or sapling was cut, the outer bark was scraped with a shell, and the inner strips, several feet long and an inch to a few inches wide, were left to soak in water. When thoroughly soaked the strips were beaten out on a flat, hollow log with a grooved wooden mallet, frequent wetting and continuous beating felting the fibres together (occasionally gum was used) until a piece of the required size was made. In Tahiti a bale was often 200yd. long, and a yard wide, and the wealth of a chief was estimated by the number of bales hanging from his palace roof. In Fiji a man would wind 200yd. round and round his body as a display of wealth. The cloth was variously coloured according to the bark used, *Ficus* becoming dark brown, breadfruit lighter brown, and paper mulberry beautifully white when dried and bleached. The common cloth was often dyed with casuarina bark, but the better kinds were decorated with patterns,

either sketched out and painted on by the artist, impressed by pressing leaves or flowers in the dye (Tahiti), or (in Samoa and Fiji) printed with printing boards, or by blocks made of strips of cane or midribs of palm leaves stitched on to the piece of leaf. Stencilling was found in Fiji alone. The making of *tapa* was woman's work, from princess to peasant.

In Uganda, the bark was peeled off the living tree, the third or fourth barks being usually the best, though a tree would continue to provide fresh barks for 30 or 40 peelings. There it was exclusively men's work, and though the beating on a hollow log was similar the beater was of a different shape. Moreover, the patterns so characteristic of Polynesian *tapa* do not occur in Africa, where any decoration is rare, though the women sometimes added patterns, the princesses of Toro tracing designs with their own blood. Different trees yielded differently coloured cloth, the common kind, when exposed to the sun, colouring light brown and better kinds terracotta. A special tree was grown to provide pure white bark-cloths to be used at the king's coronation.

BIBLIOGRAPHY.—P. Hambruch, *Oceanische Rindenstoffe* (Oldenburg, 1926) gives a summary of the Pacific industry. For a review of this and further references, as well as a description from the Garo hills, see *Man* 5, 6 (1927). For Uganda see J. Roscoe, *The Baganda* (1911) and *The Banyankole* (1924).

BARKER, EDMUND HENRY (1788–1839), English classical scholar, was born at Hollym, Yorkshire, England, and died in London on March 21 1839. He entered Trinity college, Cambridge, as a scholar in 1807, but left the university without a degree, being prevented by religious scruples from taking the oath then required. After acting as amanuensis to the famous Samuel Parr, he married and settled down at Thetford, Norfolk, where he lived for about 25 years. In later life he became involved in a law-suit which exhausted his means. In 1837–38 he was a prisoner for debt in the King's Bench and in the Fleet. Barker was one of the first commentators to write notes in English instead of Latin. He conceived the design of a new edition of Stephanus's *Thesaurus Graecae Linguae*. The work was undertaken by A. J. Valpy, and it was understood that Barker was the responsible editor. It was completed in 12 vols. (1816–28) without Barker's name. Severe criticisms of the earlier parts in the *Quarterly Review* (1820) were answered by Barker in his *Aristarchus Anti-Blomfieldianus*. He also published notes on the *Etymologicum Gudianum*, and collaborated with Prof. Dunbar, of Edinburgh, in a Greek and English Lexicon (1831). The *editio princeps* (1820) of the treatise attributed to Arcadius, *Περὶ ῥώων*, was published by him from a Paris ms. Continental scholars entertained a more favourable opinion of him than those of his own country. He expressed contempt for the minute verbal criticism of the Porsonian school, in which he was himself deficient.

An account of his life will be found in the *Gentleman's Magazine* for May 1839; see also *Notes and Queries* (6th series, xii. p. 443), where a full list of his works is given.

BARKER, SIR HERBERT ATKINSON (1869–), British manipulative surgeon, was born in Southport, Lancs., April 21, 1869. At an early age he showed an aptitude for manipulative surgery and in 1889 was placed under the tutorship of J. Atkinson. On the latter's death in 1904, Barker took over the practice, specializing in the correction of abnormalities of the joints by manipulation, and the cure of derangements of knee cartilages and flat-foot. Although he performed a large number of successful operations the medical profession refused to admit him officially to their ranks; Dr. Axham was struck off the English Medical Register for acting as his anaesthetist; and during the World War Barker's offer to give free treatment for joint and bone affections to officers and soldiers was rejected, owing to the opposition of the British army medical authorities. He was knighted, however, in 1922, as the result of a memorial to the prime minister signed by many distinguished surgeons. In 1925 he retired from his practice and went to live in Italy. His works consist principally of articles in various periodicals. In 1927 he published his memoirs, *Leaves from My Life*. (See MANIPULATIVE SURGERY.)

3. A wooden beater used by the natives of the Uganda region, in Africa, in making their bark cloth, a section of which is shown behind the beater
4. Tongan women, of the Samoan region, beating the strips of tapa on a log with rude implements
5. A native of New Guinea preparing a strip of bark cloth for a belt

a hollow vertical cylinder, provided with a number of horizontal arms fitted with lateral apertures; the contrivance was mounted so as to rotate about the vertical axis. By allowing water to enter the vertical tube, a rotation, due to the discharge through the lateral orifices, was set up.

BARKING, market town, Essex, England, on the river Roding near its junction with the Thames, 8m. E. of London on L.M.S.R. and Metropolitan District. Pop. of urban district of Barking town (1891) 14,301; (1901) 21,547; (1921) 35,523. Barking was celebrated for its nunnery, one of the oldest and richest in England, founded about 670 by Erkenwald, bishop of London, and restored in 970 by King Edgar, about 100 years after its destruction by the Danes. There remains a Perpendicular turreted gateway. There is also an ancient market-house, used as a town-hall. The Gaslight and Coke Company's works at Beckton are in the parish, also extensive rubber works. At the mouth of the Roding (Barking Creek) are great sewage works, receiving the Northern Outfall sewer from London. There are also chemical works, and some shipping trade, principally in timber.

BARKLA, CHARLES GLOVER (1877—), British scientist, was born June 7, 1877, at Widnes, Lancashire, the son of John Martin Barkla, secretary of the Atlas Chemical Co. He was educated at Liverpool institute; University college, Liverpool; and Trinity and King's colleges, Cambridge. In 1902 he became Oliver Lodge fellow of Liverpool university, and demonstrator and assistant lecturer in physics, 1905. In 1907 he was lecturer in advanced electricity, and from 1909-13 Wheatstone professor of physics in the University of London (King's college). He was then appointed (1913) professor of natural philosophy at the University of Edinburgh. He became Bakerian lecturer at the Royal Society 1916, and Hughes medallist of the same society in the following year. In 1917 he was awarded the Nobel prize for physics. He has written numerous papers on electric waves, X-rays, etc., for various scientific journals.

BARKLY EAST, a town in South Africa, 5,900ft. above sea-level; situated on the Kraai and Lange Kloof rivers, 82m. by road from Aliwal North. It is connected with railhead at New England (13m.) by post-cart. The white population in 1921 was 993. Barkly East, which is named after Sir Henry Barkly, Governor of the Cape 1870-77, is the centre of a district of the same name. The surrounding country is mountainous, and some of the neighbouring peaks of the Drakenberg reach about 10,000 feet. The climate is healthy, and local pasture is very suitable for sheep breeding.

BARKLY WEST, a town of the Cape province, South Africa, 21m. north of Kimberley, and chief town of a district of the same name in Griqualand West. It is built on the right bank of the Vaal river, here spanned by a bridge. Pop. (1921) 400 whites. Originally called Klipdrift, the town was first founded by the diggers after the discovery in 1867 of diamonds along the valley of the Vaal, and it had for some time a large floating population. On the discovery of the "dry diggings" at Kimberley the majority of the diggers went there. Barkly East remains, however, the centre of the river diggings, which are scattered along the river banks for about 70 miles. The diamonds are noted for their purity and lustre. The Barkly West electoral division is divided into the fiscal districts of Barkly West, Hay and Herbert. (See GRIQUALAND.)

BARLAAM AND JOSAPHAT. The life of Barlaam and Joasaph (or Josaphat) is a hagiographical legend, found among the writings of St. John of Damascus. It owes its interest and importance to the fact that parts of it correspond to the legend of the Buddha. It begins with the story of an Indian king Abenner, who was idolatrous and persecuted the Christians, especially the monks. A son was born to him and named Joasaph. At the birthday feast some 55 astrologers prophesied his greatness as a king, but one of them said he would be great not in his father's kingdom, and would accept the Christian religion. The king therefore had him enclosed in a beautiful palace, so that he should know nothing of the ills of life; but as the prince by being shut up was afflicted, he was at last allowed to go out, and in spite of precautions he saw a maimed man and a blind man. Later on he

saw an old man, and learned that nothing but death would relieve his misery. At this he was distressed, but disguised his grief from his father.

So far the story corresponds closely with the legend of the Buddha's youth, but at this point it diverges, and the rest of the narrative is quite different. The prince was visited by a disguised monk, Barlaam, who instructed him in the Christian doctrine, and finally baptized him. His father tried to reconvert him by holding a public dispute between idolaters and Christians, but failed, and then vainly employed Theudas, a magician, to convert the prince by means of evil spirits and women. Then in despair he divided the kingdom with his son, but after four years was converted and died. Thereupon Joasaph abdicated, made Barachias king, and went to the wilderness to find Barlaam. On the way the devil tempted him with memories of his former glory, and with visions of beasts and monsters. (Here is probably another reminiscence of a Buddhist incident, the temptation by Māra.) He found Barlaam after two years, and they lived the rest of their lives in the wilderness. After the death of Joasaph the bodies of both were removed with great pomp by the king to his own country.

The problem of the relationship of this legend to the Buddha's life has increased in complexity with successive discoveries. The resemblances were early noticed, but were brought into prominence by Liebrecht in 1860. Independent versions of the story have since been discovered, and make it probable that the Indian original was translated into some form of middle Persian and then into Greek as early as the 6th century A.D., and hence before the Mohammedan period. Still more recently fragments of a Manichaean version have been discovered by von Le Coq in Central Asia. It is held by P. Alfarc that the Christian story came through a Manichaean channel, but that there must have been still another intermediate link, which is now lost.

The exact Indian original has never been discovered. There are at least three lives of Buddha, the Sanskrit *Lalitavistara*, the Chinese version of a Sanskrit work translated into English by Beal as *The Romantic Legend of Sākya Buddha*, and the Pāli introduction to the *Jātaka* (see JĀTAKA). None of these can be put earlier than the 3rd century A.D. The form of the name Joasaph, which is a corruption of the youthful Buddha's title *Bodhisattva*, shows that the original was in Sanskrit, not Pāli, in which the *v* disappears. Yet the story of the prophecy at the birth of the prince corresponds more closely with the Pāli than with the Sanskrit. A peculiarity of the Greek is the insertion of parables related by characters in the tale. This is a distinctly Indian feature, but none of these tales is found in the existing lives of Buddha, and it is probable that the Indian original which reached Persia was a still earlier version which has disappeared. It is inexact to say that Barlaam and Josaphat have ever been canonized. They are recorded in the Roman Martyrology under Nov. 27 on the authority of John of Damascus, and Joasaph alone in a Synaxarion of the Greek Church under Aug. 26. The wide ramifications of the story in mediaeval European literature have been traced by Brauholtz and Jacobs.

The Greek text with English translation is given in *Barlaam and Joasaph*, by G. R. Woodward and H. Mattingly (1914); E. Kuhn, *Barlaam und Joasaph, eine bibliographisch-literargesch. Studie* (München, 1897); E. Brauholtz, *Die erste nichtchristliche Parabel des Barlaam und Josaphat* (Halle, 1884); J. Jacobs, *Barlaam und Josaphat* (1896); *Baralām and Yēwāsēf*, Ethiopic text. ed. and trans. by Sir E. A. W. Budge (1923); the latest results are summarized by P. Alfarc, "La vie chrétienne du Bouddha," in *Journal Asiatique* (Sept.-Oct., 1917). (E. J. T.)

BARLACH, ERNST (1870—), German artist and poet, was born at Wedel, Holstein, on Jan. 2, 1870. After distinguishing himself as a sculptor he attracted public notice with his dramatic works, *Der tote Tag* (1912), *Der arme Vetter* (1918), *Die echten Sedemunds* (1920), *Der Findling* (1922) and *Die Sündflut* (1924). He received the Kleist prize for the last named drama in 1924. He illustrated the majority of his pieces with woodcuts. He is an expressionist and his philosophical dramas represent the mythical struggles of mankind with the powers of darkness. Notwithstanding the massiveness of his forms, his drawing and sculpture reflect a delicate and sensitive understanding.

BAR-LE-DUC, a town, France, capital of the department of Meuse, 50m. E.S.E. of Châlons-sur-Marne, on the railway between that town and Nancy. Pop. (1926) 14,335. Bar-le-Duc was at one time the seat of the countship, later the duchy, of Bar. Though probably ancient, it was important only when it became the residence of the 10th century counts. The modern town extends along the narrow valley of the Ornain shut in by wooded or vine-clad hills. On the north-east is the canal from the Marne to the Rhine, on the south-west the Canal des Usines with the upper town (Ville Haute) on the left bank. The Ville Haute, reached by staircases and steep narrow thoroughfares, has houses of the 15th, 16th and 17th centuries, and the remains of the château of the dukes of Bar, dismantled in 1670, and of the church of St. Pierre (14th and 15th centuries). The lower town contains the official buildings. The town served as an important base for the southern quadrant of the western front during the World War (1914-18). Industries include iron-founding and manufacture of machinery, corsets, hosiery, flannel goods, jam, wallpaper and brewing, cotton-spinning, weaving various mixed fabrics, leather dressing and dyeing. Wine, brandy, beer, leather, timber and iron are important articles of commerce. Bar-le-Duc has tribunals of first instance and of commerce, a board of trade arbitrators, a chamber of commerce, and an art museum.

BARLETTA (anc. Barduli), episcopal see, Apulia, Italy, on the east-south-east coast, Province of Bari, 34½m. W.N.W. of Bari by rail. Pop. (1921) town 50,055, commune 51,205. It has a Romanesque cathedral begun about 1150, a Gothic church of S. Sepolcro (13th century), a castle (13th century), remodelled in 1532-37, and a 14ft. bronze statue of the emperor Valentinian I. It is a centre of the wine trade. In the neighbourhood (between Andria and Corato), during the siege of Barletta by the French in 1503, a combat took place between 13 picked knights of Italy and France, which resulted in favour of the former; it has been celebrated by Massimo d'Azeglio in his *Disfida di Barletta*.

BARLEY. The cultivated varieties of barley are grouped into three species or races, viz (1) six-rowed barley (*Hordeum hexastichon* L.); (2) Bere, Bigg or four-rowed barley (*H. vulgare* L.) and (3) two-rowed barley (*H. distichon* L.).

The axis of the ear of barley is notched on opposite sides throughout its length. At each notch there are three spikelets each containing a single flower, so that along the whole ear there are six longitudinal rows of flowers, three on one side and three on the other. In six-rowed barley all the flowers are fertile, the ear when ripe possessing six longitudinal rows of grains closely and regularly packed. The ears are short and grow erect, with comparatively long, thin grains, which are chiefly used as food for farm animals. This race is not widely grown.

In Bere all the flowers are fertile and the ears bear six rows of grain as in the previous race; these are, however, not so closely packed and are arranged less regularly along the axis. The central grains of each triplet form two longitudinal rows on opposite sides of the ear, the two lateral grains of the triplets forming two loosely constructed double rows, the ear appearing unsymmetrically four-rowed. Bere is widely cultivated and a form of it is frequently grown in the British Isles under the name Winter Barley.

In two-rowed barleys only the central flower of each spikelet is fertile, the lateral pair of flowers are either missing or imperfect, producing stamens only. The ripe ear, instead of being more or less hexagonal in cross section as in the preceding races, is compressed and has but two rows of grain. Three sub-races of two-rowed barley are recognized, viz (a) Battledore, Fan or Peacock barley (*H. Zeocriton* L.); (b) Broad erect-eared barley (*H. distichon* var. *erectum*); (c) Narrow bent-eared barley (*H. distichon* var. *nutans*).

Sub-race (a) is short-strawed with erect ears of closely set grains the awns of which spread out like an open fan when ripe. Fan Barley, now an uncommon kind, was grown extensively in the 17th and 18th centuries; it is suited to the stiffer class of soil on which it often gives a good yield of grain of fair quality.

The ears of sub-race (b) grow erect with closely packed grains which jut out from the axis at a somewhat wide angle, giving it a broad appearance. Barleys of this sub-race are suited to soils in

high condition, on which they give good yields of large plump grain; examples are the Goldthorpe and Plumage varieties.

In sub-race (c) the ears are long and narrow, with grains set on the axis at an acute angle and more widely separated from each other than in (b). When ripe they bend over, sometimes hanging downwards parallel to the straw. In this sub-race are the best malting barleys, of which Chevallier, Hanna, and Old Common are examples.

Various hybrids have been produced between representatives of the several two-rowed sub-races, with a view to securing varieties combining the high quality of one group with the stiff straw and good yield of another; examples of hybrid barleys are Sprat-Archer and Plumage-Archer.

Much evidence exists in support of the conclusion that barley was one of the first cereals cultivated by man. Grains of six-rowed barley have been discovered in Egypt dating from pre-dynastic and early dynastic periods; similar examples from pre-historic times have been found among the pile-dwellings of Switzerland. Two-rowed barleys are also of great antiquity.

There is little doubt that the cultivated two-rowed barleys have been derived from *Hordeum spontaneum* C. Koch, a wild annual species found in dry situations in Transcaucasia, Asia Minor, Syria, Palestine and Persia. The wild plant closely resembles the cultivated two-rowed race in most morphological characters but possesses a brittle rachis, the ear breaking up into separate spikelets when ripe. It is often assumed that the six-rowed races have also originated from the two-rowed wild plant. Regel, however, states that a wild six-rowed species is sometimes found with the two-rowed *H. spontaneum* and considers that it is from this that the six-rowed cultivated barleys have descended.

Barley is one of the most widely distributed cereals, being cultivated in all temperate regions of the world, as well as in Asia Minor, Egypt, North Africa and other sub-tropical countries. It is one of the hardiest of cereals and crops have been grown at the extreme northern limits of cultivation, near the Arctic Circle and often within it, reaching latitude 71°N. in Norway and 70°N. in Finland. These results are possible owing to the adaptability of the crop to a short vegetative period of 60-70 days, and to long duration of sunshine. On the high mountains of northern India and Tibet it is cultivated up to an elevation of 14,000ft.

The straw of barley is of little economic value and is used on the farm chiefly as food for stock or as litter. It is for the grain that the crop is grown, and large quantities are utilized in the preparation of malt for the manufacture of beer and spirits. For this purpose the grains should be plump, thin-skinned, of high germination capacity, and of uniform pale colour; they should be rich in starch and have a comparatively low protein-content (from 9-10%). Samples with thick husk, high protein-content, or those which have become discoloured and are otherwise unsuited for malting, are extensively employed in the feeding of farm animals.

Barley flour contains little or no gluten to which the bread-making qualities of wheat flour is due, and from it a porous loaf cannot be made; nevertheless, in many countries barley is an important article of human diet.

In all races of cultivated barley the true grain, or caryopsis, lies between two chaffy scales, the flowering glume and palea, and when ripe becomes fused with these so that it cannot be freed from them without a special milling operation. In all races, however, there are forms in which the grain is quite free and only loosely enclosed in the chaff, and on thrashing is as easily separated from the latter as a wheat grain. These are termed "naked" barleys, the grains of which are of brown or dark purple colour and superficially resemble large, somewhat flattened wheat grains, but are more pointed at both ends than the latter. In a rare form of naked barley, sometimes named "Himalayan barley" or "Nepal wheat" (*H. trifurcatum* Jacq) the flowering glume is terminated by a peculiar short, three-pronged structure instead of the single long beard met with in all other kinds of barley. In Japan the naked barleys take second place to rice as food, and in India, Tibet and some parts of Europe barley is also a valuable food. The term "pot barley" is applied to the grains from which the

husk has been removed by coarse grinding, the rounded grains of "pearl barley," used in soups, being obtained by continuing the grinding until the husk has been completely cleared away.

Cultivation.—The cultivation and management of the barley crop requires great skill. The best samples for malting purposes are grown on light calcareous and sandy loams in warm districts with a moderate rainfall. On alluvial soils and clays larger yields may be obtained, but these are of inferior quality and only suitable for feeding stock. In many districts barley follows roots or potatoes, but where the roots are fed off with sheep receiving cake there is a danger of the crop becoming rank, leading to the production of thick-skinned, dark-coloured grain of inferior malting quality. On soils in high condition on account of previous treatment, a crop of spring wheat or oats is often taken with advantage before the barley. Shallow ploughing to a depth of not more than 3 or 4 in., and the reduction of the soil to a fine tilth before sowing are important operations. The seed which should be of good germinating quality and true to varietal type, is drilled rather than broadcast in order to secure uniformity in depth of the seed and distance between the rows, both of which conditions conduce to that evenness of germination and growth which is essential to success. The amount of seed sown varies from 2-3 bushels per acre, according to the date of sowing, which is generally carried out in spring (Feb. to March), although autumn sowing has given good results.

Highly manured crops rarely give good malting barley, but phosphatic and potassic fertilisers are generally useful. The application of more than small dressings ($\frac{1}{2}$ -1 cwt. per acre) of nitrate of soda, sulphate of ammonia, or other nitrogenous manures is risky.

The crop is cut when the ears are thoroughly ripe. The average yield of grain is about 36 bushels per acre in the British Isles, with from 15-20 cwt. of straw per acre.

Various insect pests, such as wireworm, Hessian fly, and frit fly damage the barley crop, and several parasitic fungi attack it; of the latter perhaps the most prevalent are the covered and naked smut-fungi (species of *Ustilago*), which destroy the grain, and the leaf stripe fungus (*Helminthosporium*) which injures the leaves and often leads to so-called "blind" plants from which imperfectly formed or totally aborted ears are produced. See MALT.

(J P)

PRODUCTION AND TRADE

Next to wheat, barley is the most widely distributed of the cereal crops though the area devoted to its cultivation is very much less. Russia contains nearly one-third of the total acreage, and the countries which come next in order of comparative acreage are the United States, Spain, Rumania, Germany, Canada, Algeria, Poland, Morocco, Czechoslovakia, France, Argentina, Great Britain and Hungary.

Barley has been grown in Great Britain from the earliest days of settled agriculture. Under the common-field system of the middle ages it was one of the regular corn crops, being then, as now, usually sown in the spring. It was the last of the regular cereals to be sown. It was essentially the "drink-corn" and from it ale was made, although sometimes wheat and honey were mixed with it to make the traditional English beverage. Hops were not introduced until the early part of the 16th century. The two-rowed barley is stated to have been used only for brewing, the coarser four-rowed variety, known as "drage," being used partly for brewing, partly for feeding pigs and poultry. For feed corn barley and oats were often sown together. Barley is sometimes termed "bere," especially in Scotland, but the term is properly applied to the common or four-rowed variety, which in modern practice is grown only on the poorer soils.

Nearly all the barley grown in Great Britain is in England and Wales, Scotland having less than 10% of the total acreage. Fifty years ago there were about 2½ million acres in Great Britain but this has been reduced to 1½ million. The reduction, however, has been considerably less, both absolutely and relatively, than that of wheat. The crop now occupies about 12% of the arable area of England and Wales. The total annual production is about one

million tons, of which three-fifths are grown in the eastern and north-eastern counties.

The importation of barley into Great Britain and Northern Ireland in 1926 amounted to 578,000 tons as compared with 780,000 tons in the previous year and 108,000 tons in 1924. The chief sources of supply are the United States, Canada and Chile. Russia which before the War sent large quantities has only recently begun to come back into the trade. Barley is still, as in the middle ages, the chief "drink-corn," being largely used for the manufacture of beer and whiskey.

Regarded either from the agricultural or the economic point of view there are two classes of barley, one described as "malting" and the other as "feeding." No definite line can be drawn between the two classes.

The demand for barley for malting purposes is mainly dependent on the continuance of the taste for beer and whiskey. The adoption of Prohibition in the United States reacted on the cultivation of the crop in that country.

(R. H. R.)

BARLEY-BREAK, an old English country game frequently mentioned by the poets of the 17th and 18th centuries. It was played by three pairs composed of one of each sex, who were stationed in three bases or plots, contiguous to each other. The couple occupying the middle base, called *hell* or *prison*, endeavoured to catch the other two, who, when chased, might *break* to avoid being caught. If one was overtaken, he and his companion were condemned to *hell*. From this game was taken the expression "the last couple in hell," often used in old plays.

BARLEY-CORN, a grain of barley, and thus a measure taken from the length of a grain of barley, three of which (sometimes four) were considered to make up an inch. The barley-corn has been personified as representing the malt liquor made from barley, as in Burns's song "John Barleycorn."

BARLOW, JOEL (1754-1812), American poet and politician, was born in Redding, Conn., on March 24, 1754. He graduated at Yale in 1778, did post-graduate work there, and was for three years a chaplain in the Revolutionary army. In July 1784 he established at Hartford, Conn., a weekly paper, the *American Mercury*, with which he was connected for a year. In 1786 he was admitted to the bar. At Hartford he was a member of the group of young writers known as the "Hartford Wits." He contributed to the *Anarchiad*, a series of satirico-political papers, and in 1787 published a long and ambitious poem, *The Vision of Columbus*, which gave him a considerable literary reputation. In 1788 he went to France as the agent of the Scioto Land Company, which later failed, and in 1789 he induced the company of Frenchmen who ultimately founded Gallipolis, O., to emigrate to America. In Paris he became a liberal in religion and an advanced republican in politics. He was a member of the London "Society for Constitutional Information"; published various radical essays, including a volume entitled *Advice to the Privileged Orders* (1792), which was proscribed by the British Government; and was made a citizen of France in 1792. On a mission to Algiers in 1795-97 he secured the release of American prisoners held for ransom and negotiated a treaty with Tripoli. He returned to America in 1805, with a fortune which he had made abroad, and lived near Washington, D.C., until 1811, when he became American plenipotentiary to France, charged with negotiating a commercial treaty with Napoleon and with securing the restitution of confiscated American property or indemnity therefor. In this capacity he became involved in the retreat of the French army from Russia; and, overcome by exposure, died at the Polish village of Zarnowiec on Dec. 24, 1812.

In 1807 Barlow had published in a sumptuous volume the *Columbiad*, an enlarged edition of his *Vision of Columbus*, more pompous even than the original. The poem for which he is now best known is his mock-heroic *Hasty Pudding* (1793), a graceful, pleasantly humorous pastoral poem. He published also religious verse, *The Conspiracy of Kings: A Poem Addressed to the Inhabitants of Europe from Another Quarter of the Globe* (1792), and *A View of the Public Debt, Receipts and Expenditures of the United States* (1800). His political writings in collected form went through several editions in his lifetime. See C. B. Todd's *Life and Letters of Joel Barlow* (1886); and "The Literary Strivings of Mr Joel Barlow," in M. C. Tyler's *Three Men of Letters* (1895).

BARLOW, PETER (1776–1862), English writer on pure and applied mathematics, was born at Norwich. In 1806 he was appointed mathematical master in the Woolwich Academy, and filled that post for 41 years. In 1823 he was made a fellow of the Royal Society, and two years later received the Copley medal. He studied especially steam locomotion, and sat on the railway commissions of 1836, 1839, 1842, 1845. He received many distinctions from British and foreign scientific societies. Barlow's principal works are: *Elementary Investigation of the Theory of Numbers* (1811); *New Mathematical and Philosophical Dictionary* (1814); *Essay on Magnetic Attractions* (1820). The investigations on magnetism led to the important practical discovery of a means of rectifying or compensating compass errors in ships.

BARM, the scum formed on the top of malt liquor when fermenting; yeast used to leaven bread, or to set up fermentation in liquor. See YEAST, FERMENTATION, BREWING.

BARMECIDES, better, **BARMAKIDS**, a noble Persian family which attained great power under the Abbasid caliphs. Barmak, the founder of the family, was a Parsi. According to tradition, his wife was taken for a time into the harem of Abdallah, brother of Kotalba, the conqueror of Balkh, and became the mother of Khalid b. Barmak the Barmecide. Barmak subsequently (about A.D. 736) rebuilt and adorned his native city of Balkh after the rebellion of Harith. The family prospered, and his grandson Yahyā b. Khalid was the vizier of the caliph Mahdo and tutor of Harūn al-Rashid. His sons Fadl and Ja'far (the Giafar of the *Arabian Nights*) both occupied high offices under Harūn. See further CALIPHATE, section C. §§ 4, 5.

The expression "Barmecide feast," to denote an imaginary banquet, is drawn from one of the tales ("The Barber's Tale of his Sixth Brother") in the *Arabian Nights*, in which a series of empty dishes is served up by one of the Barmecides to a hungry man, to test his sense of humour (see edition by L. C. Smithers, 1894, vol. i. 317).

BARMEN, town, Rhenish Prussia, Germany. Pop. (1816), 19,030; (1890), 116,144; (1925), 187,239. It lies on the main Aachen-Berlin railway, east of Elberfeld, with which it virtually forms one town, stretching for some 4m. along the narrow valley of the Wupper. High wooded hills surround it. It is divided into three main districts, Upper, Middle and Lower Barmen. Public buildings include the *Ruhmeshalle* which contains the town library, a picture-gallery, an ethnographical museum, and an exchange. There are several high-grade schools. Barmen is one of the most important manufacturing centres of Germany. The development of its commercial activity dates from the beginning of the 19th century. Ribbon-weaving is the chief industry; cotton and cloth goods, lace, braids, steel wares, chemicals and buttons are also made. The print-fields and dyeworks were long famous (since 1784) for their Turkey-red, but it has been superseded by the chemical alizarin dye since 1870. Its export trade, particularly to the United States, is considerable. The hills lying south of the town are laid out in public grounds. Barmen, although mentioned in chronicles in the 11th century, did not attain civic rights until 1808, when it was formed into a municipality by the grand duke of Berg.

BARMOTE COURT (also BERGHMOTTE, BARGHMOTTE, BARGEMOTTE, BARMOOT), a court held in the lead-mining districts of Derbyshire, England, for the purpose of determining the customs peculiar to the industry and for the settlement of disputes arising in connection therewith. Barmote courts are of very ancient origin, having been in existence in the reign of Edward I. Their jurisdiction extends both to the crown lands in the duchy of Lancaster and to those under individual ownership, comprising seven clearly defined districts. Owing to the progress in modern mining, many of the customs and much of the procedure became obsolete, and their powers were regulated by the High Peak Mining Customs and Mineral Courts Act 1851. An appeal from the jurisdiction of the courts lies by way of *certiorari*.

BARMOUTH (Abermaw, mouth of the Maw, or Mawddach) is a sea-side town on the north bank of the Mawddach estuary, Merionethshire, north Wales. Pop. U.D. (1921) 3,553. Until the advent of the railway it was secluded. It is on the coast route

of the old Cambrian (now G.W.R.) line, with connections via Dolgelly to the Welsh border. The railway facilities, together with the fine mountain and river scenery of the neighbourhood, have made it a well-known summer resort.

BARNABAS, the surname given by the apostles (Acts iv. 36, possibly in distinction from Joseph Barsabbas, Acts i. 23) to Joseph, "a Levite, a man of Cyprus by birth," who, though not of the Twelve, came to rank as an apostle (Acts xiv. 4, 14, I Cor. ix. 6; see APOSTLE). The Greek rendering of this Semitic sobriquet means "son of consolation" (A.V.) or "son of exhortation" (R.V.), the latter best suiting his "prophetic" or inspired manner of speaking (Acts xiii. 1). Its etymology is not yet cleared up. But it seems best to assume some Aramaic form equivalent to the Greek. That Barnabas's "exhortation" was of the inspiring and cheering kind, and so "built up" faith (cf. Acts ix. 31, xv. 32, I Cor. xiv. 3, Phil. ii. 1), is most probable (see Acts xi. 22 seq.). His power lay in a loving heart ("a good man," xi. 24), with divinely sympathetic insight into persons (ix. 27) and true religion (xi. 23 seq.). His generous nature took effect also in meeting the bodily needs of his fellows (iv. 36 seq.).

Yet we must beware of regarding Barnabas merely as a fine character; he plays too big a part in the early Church for any such limitation. Only a man of insight and authority would have been sent by the Jerusalem Church to inspect and judge of the new departure at Antioch (Acts xi. 22), where momentous issues were involved. Ere long he called in the aid of his friend Saul to cope with the new and expanding situation (25 seq.). Next, after their joint visit or visits to Judaea and Jerusalem (Gal. ii. 1 seq.; Acts xi. 30, xii. 25) (see PAUL), we get a glimpse of him as still chief among the "prophets and teachers" of the Antiochene Church, and as called by the Spirit, along with Saul, to initiate a yet wider mission of the Gospel, in regions beyond Syria (xiii. 1–3). He led the way to his native Cyprus; but in the struggle with the magician, Bar-Jesus (xiii. 7 seq.), Saul came so decisively to the front, that henceforth he takes the lead (see xiii. 13, "Paul and his company," and note the turning back of Mark, the kinsman of Barnabas). Barnabas's vacillation at Antioch (Gal. ii. 11 seq.), whether it preceded or followed the mission in Acts xiii.–xiv.), shows that, while gifted with true intuitions, he was less strong in thinking out his position to all its issues on principle. But what he did see with full conviction, he was staunch in upholding; witness his support of Gentile freedom from the obligation of circumcision at the Jerusalem conference (Acts xv.).

When Barnabas sails away with Mark to resume work in Cyprus, the mists of history close about him. Only now and again do we catch fugitive glimpses of him and his work (I Cor. ix. 6, Col. iv. 10). Tradition, which early regards him as one of the Seventy (Clem. Alex.), carries him, plausibly enough, to Alexandria (Clem. Hom. i. 8, ii. 4; cf. the ascription to him of the Alexandrine *Epistle of Barnabas*), and even to Rome (Actus Petri Vercell. c. 4, Clem. Recog. i. 7, cf. Hom. i. 7) not to say Milan. The date of his death is uncertain, but probably fell before Acts was written (c. A.D. 75–80).

See W. Cunningham, *Epistle of Barnabas*, pp. xlvi.–lxii.; O. Braunsberger, *Der Apostel Barnabas, sein Leben* . . . (Mainz, 1876); articles s.v. in *Ency. Biblica* and *Hastings' Dictionary of the Bible*.

(J. V. B.)

BARNABAS, EPISTLE OF. The epistle is one of "The Apostolic Fathers." It stands at the end of the 4th century *Codex Sinaiticus* of the New Testament, in a sort of appendix. This means that it once enjoyed quasicanonial authority, a fact borne out by Clement, Origen and Eusebius (*H.E.* iii. 25). Internal evidence refutes its ascription to Barnabas; nor does the epistle itself make any such claim.

"That Alexandria, the place of its earliest reception, was also the place of its birth, is borne out by the internal evidence of style and interpretation, which is Alexandrian throughout." So wrote Lightfoot. But neither its "Alexandrianism" nor its "astounding familiarity with the Jewish rites" (Kohler in the *Jewish Encycl.*) proves this; still less that "the writer seems to have been a converted Jew." For, apart from seeming blunders in Jewish matters, he classes himself with his readers as formerly

idolaters (xvi. 7, *seq.*). It is enough, then, to regard him as in close contact with Judaism. He seems also to have just visited his readers as a stranger, probably from Alexandria, or (i. 2-4) from Syria, the older home of Christianity, where also "the Two Ways" which he cites probably originated. He used his greater experience on the subject to warn his readers against all compromise between Judaism and the Gospel. He goes so far as to deny any historical connection between the two. The Divine oracles had ever pointed to the Christian Covenant, and had been so understood by the men of God in Israel, whereas the apostate people had turned aside to keep the ceremonial letter of the law at the instigation of an evil angel (ix. 4). He takes in succession the typical Jewish institutions—Circumcision, Foods, Ablutions, Covenant, Sabbath, Temple—showing their spiritual counterpart in the New People and its ordinances, and that the Cross was pre-figured from the first. Such insight (*gnosis*) he regards as the mark of mature Christian faith. The burden of his epistle is, "Let us become spiritual, a perfect temple unto God" (iv. 11); and that not only by theoretic insight, but also by practical wisdom of life. To enforce this he passes to "another sort of *gnosis* and instruction" (xviii. 1) *viz.*, the precepts of the "Two Ways," cited in a slightly different form from that in the first part of the *Didaché* or *Teaching of the Apostles*. The modifications are all in a more spiritual direction, in keeping with the evangelic spirit which pervades even the allegorical ingenuities of the epistle.

Its date has been much debated. But Lightfoot's reading of the apocalyptic passage in ch. iv.—as modified by Sir W. M. Ramsay—points clearly to the reign of Vespasian (A.D. 70-79). Thus it is the earliest of the Apostolic Fathers

BIBLIOGRAPHY.—Besides collected editions of the Apostolic Fathers, e.g., that of Gebhardt and Harnack and of F. X. Funk (2nd ed., 1901), see O. Braunsberger, *Der Apostel Barnabas, u. der ihm beigelegte Brief* (Mainz, 1876); W. Cunningham, *Epistle of Barnabas* (1877); E. Reuss, *Théologie chrétienne*, vol. ii., also Lightfoot's fragmentary essay in his *Clement of Rome*, ii. 503-512. See also APOCRYPHAL LITERATURE, section "New Testament." (J. V. B.)

BARNABAS, GOSPEL OF. We read in antiquity (e.g., in the *Decretum Gelasii*) of an apocryphal Gospel of Barnabas (See APOCRYPHAL LITERATURE) Traces of it may survive in a later book with this title, probably embodying materials partly Gnostic in character and origin (trans by L. Ragg, Oxford, 1907). It seems "a forgery of the 15th century at earliest, written in Italian by a renegade from Christianity to Islam" (M. R. James, *The Apoc. N.T.*, p. xxvi).

BARNABITES, a religious order ecclesiastically known by the name of "Clerics Regular of St. Paul," founded in 1530 by Antonio Maria Zaccaria (1502-1539, canonized 1897) and confirmed as an order by the Vatican in 1535 and 1579. In addition to monastic devotion, their vocation included education and missionary work among the multitudes reduced to material and moral misery by the contemporary wars. They were also committed to special study of the Pauline Epistles. In 1538 the order acquired the ancient church of St. Barnabas in Milan (hence the name by which it is commonly known). It has never spread widely. There are 20 monasteries in Italy and a few in Austria, Belgium and Spain.

BARNABY, SIR NATHANIEL (1820-1915), English naval architect, was born at Chatham on Feb. 25, 1829, and died at Lewisham on June 15, 1915. From 1854 to 1885 Barnaby was employed in the constructive department of the Admiralty, during which time he took an active part in the great changes in naval construction, iron taking the place of wood, and steel of iron, as the material for shipbuilding, in his time. In 1864 he was appointed Assistant Naval Constructor, and in 1870, on the resignation of Sir Edward Reed, chief Constructor, Barnaby was made President of a Council of Construction, and in 1872 definitely received the title of Chief Naval Architect, afterwards changed to that of Director of Naval Construction. In 1885 he was made a K.C.B., but in that year he was obliged to retire from public service, on account of ill health. Barnaby contributed articles on the *Navy* and *Shipbuilding* to the 9th edition of the *Encyclopædia Britannica*. He was one of the founders of the Institution of Naval Architects, and contributed to its *Transac-*

tions, besides writing, among other works, *Abridgments of Specifications Relating to Shipbuilding, etc., from 1618 to the Present Time* (1862), and *Naval Development in the 19th Century* (1902).

BARNACLE, a name applied to Crustacea of the division *Cirripedia*. Originally, the name was given to the stalked barnacles (*Lepadidae* of C. Darwin), which attach themselves in great numbers to drift-wood and other objects floating in the sea and are one of the chief agents in the fouling of ships' bottoms during long voyages. The sessile barnacles (*Balanidae* of Darwin) or "acorn-shells" are found in myriads, encrusting the rocks between tide-marks on all coasts. One of the most extraordinary and persistent myths of mediaeval natural history was the cause of transferring to these organisms the name of the barnack or bernacle goose (*Branta leucopsis*). This bird is a winter visitor to Britain and, its Arctic nesting-places being then unknown, it was fabled to originate within the shell-like fruit of a tree growing by the sea-shore, usually represented in the guise of a barnacle of the genus *Lepas*. Even after the scientific study of zoology had replaced the fabulous tales of mediaeval writers, the barnacles were classed with the Mollusca, some of which they resemble in external appearance. It was not till J. Vaughan Thompson demonstrated, in 1830, their development from a free-swimming and typically Crustacean larva that it came to be recognized that, in Huxley's graphic phrase, "a barnacle may be said to be a Crustacean fixed by its head and kicking the food into its mouth with its legs." For a systematic account of the barnacles and their allies, see CIRRIPIEDIA. (W. T. C.)

BARNACLE PAINT or **ANTI-FOULING MARINE PAINT**: see PAINT.

BARNARD, LADY ANNE (1750-1825), author of the ballad "Auld Robin Gray," the eldest daughter of James Lindsay, 5th earl of Balcarres, married in 1793 Andrew Barnard, who became colonial secretary at the Cape of Good Hope. Thither the Barnards went in March 1797, Lady Anne remaining at the Cape until Jan. 1802. A series of letters written by Lady Anne to Henry Dundas, then secretary for war and the colonies, was published in 1901 under the title *South Africa a Century Ago*. "Auld Robin Gray" was written by her in 1772 to music by the Rev. William Levees (1748-1828).

See the memoir by W. H. Wilkins, together with the original text of "Auld Robin Gray," prefixed to *South Africa a Century Ago*.

BARNARD, EDWARD EMERSON (1857-1923), American astronomer, was born in Nashville, Tenn., on Dec. 16, 1857. He began his studies alone in boyhood. In 1887 he graduated at Vanderbilt university, after having charge of the observatory there for four years. In 1887 he was appointed astronomer at Lick Observatory, and from 1895 until his death he was professor of practical astronomy and astronomer of Yerkes Observatory, at the University of Chicago. He accompanied the U.S. Naval Observatory Eclipse Expedition to Sumatra (1901). His contributions to observational astronomy were numerous and important. In celestial photography he obtained excellent results and discovered 16 comets, Jupiter's fifth satellite and the star with the greatest known motion (1916). He was associate editor of the *Astronomical Journal* and the author of *Micrometrical Observations of Eros Made During Opposition of 1900-1901*.

A bibliography may be found in J. A. Parkhurst's "Edward Emerson Barnard," in *National Academy of Sciences—Report*, pp. 49-53 (1923). For further biographical material consult: *Royal Astronomical Society, Monthly Notices*, vol. lxxv., pp. 221-225; Robert G. Aiken's "Edward Emerson Barnard (1857-1923)" in *Astronomical Society of the Pacific*, vol. xxxv., pp. 87-94.

BARNARD, FREDERICK AUGUSTUS PORTER (1809-1889), American scientist and educator, was born in Sheffield (Mass.), on May 5, 1809. In 1828 he graduated at Yale. He was then in turn a tutor at Yale, a teacher (1831-32) in the American asylum for the deaf and dumb, Hartford (Conn.), and a teacher (1832-38) in the New York Institute for the Instruction of the Deaf and Dumb. From 1838 to 1848 he was professor of mathematics and natural philosophy, and from 1848-54 was professor of chemistry and natural history in the University of Alabama, also filling for two years the chair of English literature. In 1854 he was ordained as deacon in the Protestant Episcopal

Church. In the same year he became professor of mathematics and natural philosophy in the University of Mississippi, of which institution he was chancellor from 1856 until the outbreak of the Civil War, when, his sympathies being with the North, he resigned and went to Washington. There for some time he was in charge of the map and chart department of the U.S. coast survey. In 1864 he became the tenth president of Columbia college (now Columbia university) in New York city, which position he held until the year before his death, his service thus being longer than that of any of his predecessors. During this period the growth of the college was rapid; new departments were established; the elective system was greatly extended; more adequate provision was made for graduate study and original research, and the enrolment was increased from about 150 to more than 1,000 students. Barnard strove to have educational privileges extended by the university to women as well as to men, and Barnard college, for women (see COLUMBIA UNIVERSITY), established immediately after his death, was named in his honour. He died in New York city on April 27, 1889. Barnard was a versatile man, of catholic training, a classical and English scholar, a mathematician, a physicist and a chemist, a good public speaker, and a vigorous but somewhat prolix writer on various subjects, his annual reports to the board of trustees of Columbia being particularly valuable as discussions of educational problems. Barnard was the editor-in-chief in 1872 of *Johnson's Universal Cyclopaedia*. He published a *Treatise on Arithmetic* (1830); an *Analytical Grammar with Symbolic Illustrations* (1836); *Letters on College Government* (1855); *History of American Coast Survey* (1857); *Recent Progress of Science* (1869); and *Metric System of Weights and Measures* (1871).

For biography see John Fulton's *Memoirs of Frederick A. P. Barnard* (1896); "Frederick A. P. Barnard," *Science*, new series, vol. x. (1899); and "Frederick A. P. Barnard," *A History of the First Half-century of the National Academy of Sciences, 1863-1913* (1913).

BARNARD, GEORGE GREY (1863–), American sculptor, was born at Bellefonte (Pa.), on May 24, 1863. He first studied at the Art institute, Chicago, and in 1883-87 worked in P. T. Cavelier's atelier at Paris. He lived in Paris for 12 years, returning to America in 1896; and with his first exhibit at the Salon of 1894 he scored a great success. His early works include "The Boy" (1885); "Brotherly Love," sometimes called "Two Friends" (1887); the allegorical "Two Natures" (1894, in the Metropolitan museum, New York city); "The Hower" (1902, at Cairo, Ill.); and "Great God Pan" (in Central park, New York city). In 1912 he completed his two groups of 31 statues for the Pennsylvania capitol at Harrisburg. His bronze statue of Lincoln, heroic in size and the subject of bitter controversy, was unveiled in Lytle park, Cincinnati, in 1917. Prominent critics denounced it, Robert T. Lincoln, son of Abraham Lincoln, objected to the placing of replicas in London and Paris, and the National Academy of Design issued a formal protest. On the other hand, many admirers of Lincoln, including Miss Tarbell, his biographer, and Theodore Roosevelt, warmly praised it. Most notable among Barnard's later works are "Rising Woman" (1918) and "Adam and Eve" (1923), both in marble and purchased by J. D. Rockefeller, Jr.; "A Monument to Democracy" (1920), containing 400 figures in plaster; and "Let There Be Light," a bronze statue of heroic size, for Louisville (Ky.) (1925).

BARNARD, HENRY (1811-1900), American educationist, was born in Hartford, Conn., Jan. 24, 1811. He graduated at Yale in 1836, and in 1835 was admitted to the Connecticut bar. In 1837-39 he became a member of the Connecticut legislature, effecting in 1838 the passage of a bill, framed and introduced by himself, which established a board of "commissioners of common schools" in the State, as secretary of which he worked indefatigably till its abolition in 1842. In 1843 he was appointed by the governor of Rhode Island agent to examine the public schools of the State, his work resulting in the reorganization of the school system two years later. He was the first commissioner of public schools there (1845-49), and then returned to Connecticut, where he was for some years "superintendent of common schools" and principal of the State normal school at New Britain. From 1859

to 1860 he was chancellor of the university of Wisconsin and agent of the board of regents of the normal school fund: in 1866-67 he was president of St. John's college, Annapolis, Md., and from 1867 to 1870 he was the first U.S. commissioner of education, in which position he laid the foundation for the subsequent useful work of the bureau of education. His chief service to the cause of education, however, was rendered as the editor of the *American Journal of Education*. He also edited the *Connecticut Common School Journal* and the *Journal of the Rhode Island Institute of Instruction*. He died at Hartford, Conn., on July 5, 1900. Among American educational reformers Barnard is entitled to be classed with Horace Mann of Massachusetts.

See a biographical sketch by A. D. Mayo in the *Report of the Commissioner of Education for 1896-97*, further tributes in the *Report for 1902*, W. S. Monroe's *Educational Labours of Henry Barnard* (1893) and his *Bibliography of Henry Barnard* (1897); also the article in the *Cyclopedia of Education* and B. C. Steiner's *Life of Henry Barnard* in the *Bulletin of the Bureau of Education*, No. 8 (1919).

BARNARD, JOHN, English musician, was a minor canon of St. Paul's in the reign of Charles I. He was the first to publish a collection of English cathedral music—*The First Book of Selected Church Music* (1641). It contains some of the finest 16th-century masterpieces by Tallis, Gibbons, Byrd, Morley and others. The only known complete copy of the book is in the British Museum.

BARNARD, JOSEPH EDWIN (1870–), British physicist, born in London, achieved considerable success in the science of microscopy. He carried out valuable work at the National Institute for Medical Research, Hampstead, London, where he was in charge of the department of applied optics, by co-operating with Dr. Gye in the demonstration in 1925 of the existence of the cancer virus. He held in addition the post of lecturer at King's college, London, and was president and honorary secretary of the Royal Microscopical Society, London. He was elected F.R.S. in 1924.

BARNARD CASTLE, urban district, Durham, England, 17m. W. of Darlington by a branch of the London and North-Eastern railway. Population (1921) 4,738. It is beautifully situated on the steep left bank of the Tees. There are a few picturesque old houses, and a fragment of an Augustinian convent, but the building of chief interest is the castle, which gives the town its name, and is the principal scene of Sir Walter Scott's *Rokeby*. As part of the lordship of Gainford, Barnard Castle is said to have been granted by William Rufus to Guy Baliol Barnard, son of Guy Baliol, who built the castle, and called it after himself, Castle Barnard. To the men of the town which grew up outside the castle walls he gave a charter making them burgesses. Other confirmation charters were granted to the town by Hugh, John, and Alexander Baliol. After forfeiture by John Baliol (1296) it was claimed by the bishop of Durham but the claim was denied by the Crown which granted it to the Beauchamps, from whom it passed to the Crown by marriage of Anne Nevill with Richard III.

Tanning leather was formerly one of the chief industries of the town. In the vicinity are Egglestone abbey, beautifully situated on the Yorkshire bank of the river, and the massive 14th century castle of Raby to the north-east. The corn-market and the manufacture of shoe thread were formerly important but now many of the inhabitants find work in the foundries and metal works of the adjoining coal-field.

BARNARDO, THOMAS JOHN (1845-1905), English philanthropist, and founder and director of homes for destitute children, was born at Dublin, Ireland. His father was of Spanish origin, his mother being an Englishwoman. He studied medicine at the London hospital, and later at Paris and Edinburgh. His medical work in the east end of London during the epidemic of cholera in 1865 so impressed him with the great numbers of homeless and destitute children in the cities of England that he gave up his early ambition of foreign missionary labour, and began what was to prove his life's work. The first of the "Dr. Barnardo's Homes" was opened in 1867 in Stepney Causeway, London, where are still the headquarters of the institution. From

that time the work steadily increased until, at the time of the founder's death, there were established 112 district "Homes," besides mission branches, throughout Great Britain. The object for which these institutions were started was to search for and to receive waifs and strays, to feed, clothe, educate, and, where possible, to give an industrial training suitable to each child. In 1872 was founded the girls' village home at Barking-side with its own church where Barnardo himself was buried and in 1901, through the generosity of E. H. Watts, a naval school was started at North Elmham, near Norwich, to which boys are drafted from the homes to be trained for the navy and the mercantile marine. Perhaps the most useful of all the varied work instituted by Barnardo is the emigration system and the fact that in Canada less than 2% of the many thousands of children sent out proved failures confirmed Barnardo's conviction that "if the children of the slums can be removed from their surroundings early enough, and can be kept sufficiently long under training, heredity counts for little, environment for almost everything." In 1899 the various institutions and organizations were legally incorporated under the title of "The National Association for the Reclamation of Destitute Waif Children," but the institution has always been familiarly known as "Dr. Barnardo's Homes." Barnardo laid great stress on the religious teaching of the children under his care. Each child is brought up under the influence and teaching of the denomination of the parents, but the children of Jewish and Roman Catholic parentage are, where possible, handed over to the care of the Jewish Board of Guardians in London, and to Roman Catholic institutions, respectively. From the foundation of the homes in 1867 to the date of Barnardo's death, nearly 60,000 children had been rescued, trained and placed out in life. Barnardo died of angina pectoris in London, and was succeeded by Dr. William Baker, formerly the chairman of the council. Barnardo was the author of many books dealing with the charitable work to which he devoted his life.

His biography (1907) was written by his wife (the daughter of William Elmslie) and J. Marchant. The periodicals and leaflets describing the activities of the homes are published at the central office of the Chantry at Stepney Causeway.

BARNATO, BARNETT (1852-1897), English speculator, the son of a Jewish shop-keeper, Isaac Isaacs, was born in Aldgate, London, in 1852. In 1873 he joined his elder brother, Henry, in Kimberley, where the latter had gone, to trade in diamonds. When Isaacs arrived there he changed his name to Barnato, and set up a small store, but soon joined his brother's business; by 1876 he had saved enough to buy his first claim in the Kimberley Diamond Mine, and in 1881 he floated his first company. His ambition to unite all the companies in Kimberley under a single organization led at first to rivalry and finally to amalgamation (1888) with Cecil Rhodes, who had succeeded in consolidating the De Beers Mining companies. In the same year "Barney Barnato"—as he was called—was elected by Kimberley to a seat in the Cape Colony House of Assembly. In 1889 he established a gold mining company on the Rand, and, soon after, floated the Barnato Consolidated Mines Company and the Barnato Bank, while in 1895, he organized the last great boom in gold mines in the Rand. On June 14, 1897, he committed suicide by jumping from a vessel at sea.

See H. Raymond, *B. I. Barnato; A Memoir* (1897)

BARNAUL, a town in the Siberian area of the Russian Republic, on the railway from Novo-Sibirsk to Semipalatinsk, at the junction of the river Barnaulka and the river Ob. Lat. 53° 23' N., long. 83° 40' E., alt. 480ft. Pop. (1926) 73,798, and increase of 33,948 in 26 years. Av. rainfall p.a. 10 ins., with a maximum in July and August. Av. temp. Jan. -22° F, July 67.1° F. A Demidov, to whom there is a monument, founded the city in 1730. Barnaul is the administrative centre of the Altai mining district: the first Russian mine was opened at Kolyvan in 1727, and the second at Barnaul in 1739. The Altai mines produce coal, gold and iron (especially in the Kuznetsk area) and silver, copper, lead and zinc in the Altai proper. The town is also an agricultural centre and has a storage plant for Siberian butter and eggs: it exports wax and honey from the numerous bee-keeping centres

and has a goods exchange. Barnaul, with its navigable river (the Ob) and its railway, is a collecting point for the wheat, oats, barley, buckwheat and potatoes grown in the province, and for cattle, sheep, goats and swine. It has smelting, glass-making, bell founding and other manufactures. In 1841 a meteorological observatory was established; there are also a mining school, and geological and zoological museums. Many of the Russian inhabitants are descendants of religious and political exiles.

BARNAVE, ANTOINE PIERRE JOSEPH MARIE (1761-1793), one of the greatest orators of the first French Revolution, was born at Grenoble in Dauphiné, Oct. 22 1761. Dauphiné was one of the first of the provinces to feel the excitement of the coming revolution; and Barnave was foremost to give voice to the general feeling, in a pamphlet entitled *Esprit des édits enregistrés militairement le 20 mai 1788*. He was immediately elected deputy, with his father, to the states of Dauphiné, and took a prominent part in their debates. A few months later he was chosen deputy of the *tiers état* for his native province. He soon made an impression on the Assembly, became the friend of most of the leaders of the popular party, and formed with Adrien Duport and Alexandre Lameth (*q.v.*) the group known during the Constituent Assembly as "the triumvirate." He took part in the conference on the claims of the three orders, drew up the first address to the king, and supported the proposal of Sieyès that the Assembly should declare itself National. Until 1791 he was one of the principal members of the club known later as the Jacobins, of which he drew up the manifesto and first rules (*see* JACOBINS).

Though a passionate lover of liberty, he hoped to secure the freedom of France and her monarchy at the same time. With the one exception of Mirabeau, Barnave was the most powerful orator of the Assembly. He advocated the suspensory veto, and the establishment of trial by jury in civil causes, but voted with the Left against the system of two chambers. His conflict with Mirabeau on the question of assigning to the king the right to make peace or war (May 16-23 1791) was one of the most striking scenes in the Assembly. In Aug. 1790, after a vehement debate, he fought a duel with J. A. M. de Cazalès, in which the latter was slightly wounded. About the close of Oct. 1790 Barnave was called to the presidency of the Assembly. On the arrest of the king and the royal family at Varennes, while attempting to escape from France, Barnave was one of the three appointed to conduct them back to Paris. On the journey he was affected by the mournful fate of Marie Antoinette, and in one of his most powerful speeches he maintained the inviolability of the king's person. His public career ended with the close of the Constituent Assembly, and he returned to Grenoble at the beginning of 1792. His sympathy and relations with the royal family, to whom he had submitted a plan for a counter-revolution, brought on him suspicion of treason. Denounced (Aug. 15, 1792) in the Legislative Assembly, he was arrested and imprisoned for ten months at Grenoble, then transferred to Fort Barraux, and in Nov. 1793 to Paris. The nobility of his character was proof against the assaults of suffering. "Better to suffer and to die," he said, "than lose one shade of my moral and political character." On Nov. 28 he appeared before the Revolutionary Tribunal. He was condemned on the evidence of papers found at the Tuileries and executed the next day.

Barnave's *Oeuvres posthumes* were published in 1842 by Béranger (de la Drôme). See F. A. Aulard, *Les Orateurs de l'Assemblée constituante* (1882).

BARNBY, SIR JOSEPH (1838-1896), English musical composer and conductor, son of Thomas Barnby, an organist, was born at York Aug. 12, 1838. He was a chorister at York minster from the age of seven, was educated at the Royal Academy of Music under Cipriani Potter and Charles Lucas, and was appointed in 1862 organist of St. Andrew's, Wells street, London. In 1871 he was appointed, in succession to Gounod, conductor of the Albert Hall Choral Society, a post which he held till his death. In 1875 he was precentor and director of music at Eton, and in 1892 became principal of the Guildhall School of Music and was knighted. His works include 246 hymn-tunes, as well as some part-songs (among them the popular "Sweet and Low"), and some pieces for the organ. He died in London Jan. 28, 1896.

BARNES, BARNABE (c. 1568–1609), English poet, fourth son of Dr. Richard Barnes, bishop of Durham, was entered in 1586 at Brasenose college, Oxford, where Giovanni Florio was his servitor, and in 1591 went to France with the earl of Essex, who was then serving against the prince of Parma. On his return he published *Parthenophil and Parthenophe, Sonnettes, Madrigals, Elegies, and Odes* (ent. on Stationers' Register, 1593), dedicated to his "dearest friend," William Percy, who contributed a sonnet to the eulogies prefixed to a later work, *Offices*. *Parthenophil* was possibly printed for private circulation, and the copy in the duke of Devonshire's library is believed to be unique. Barnes was well acquainted with the work of contemporary French sonneteers, to whom he is largely indebted, and he borrows his title, apparently, from a Neapolitan writer of Latin verse, Hieronymus Angerianus. *Parthenophil* abounds in passages of great freshness and beauty, although its elaborate conceits are sometimes over-ingenious and strained. Barnes took the part of Gabriel Harvey and even experimented in classical metres. He has been claimed by some scholars as the "rival poet" of Shakespeare's sonnets, and even as the author of some of them.

Other works by Barnes are: *A Divine Centurie of Spirituall Sonnetts* (1595); two plays: *The Devil's Charter* (1607), and *The Battle of Evesham* (or Hexham), now lost; and a prose treatise, *Offices enabling privat Persons for the speciall service of all good Princes and Pokcies* (1606). His *Parthenophil and Spirituall Sonnetts* were edited by Dr. A. B. Grosart in a limited issue in 1875; *Parthenophil* was included by Prof. E. Arber in vol. v. of *An English Garner*; see also the new edition of *An English Garner (Elizabethan Sonnets*, ed. S. Lee, 1904, pp. lxxv. et seq.). Prof. E. Dowden contributed a sympathetic criticism of Barnes to *The Academy* of Sept. 2, 1876.

BARNES, ERNEST WILLIAM (1874–), British divine, was born on April 1, 1874, and was educated at King Edward's school, Birmingham, and at Trinity college, Cambridge, where he had a brilliant career, being bracketed second wrangler in 1896 and elected in 1898 to a fellowship of his college. Ordained deacon in 1902 and priest in 1903, he held various appointments at Trinity college, Cambridge, becoming tutor in 1908. He wrote many valuable papers on mathematics and in 1909 was elected F.R.S. In 1915 he was appointed Master of the Temple and in 1918 canon of Westminster. He rapidly acquired a reputation as a vigorous and broadminded preacher and in his sermons discussed either evolution and science, or the more homely aspects of Christianity, with equal candour and individuality. In 1924, on the recommendation of Mr. Ramsay MacDonald, Canon Barnes was appointed bishop of Birmingham. In this capacity his "advanced" views, and in particular his refusal to sanction the practice of the reservation of the Sacrament which he considered contrary to the spirit of the Prayer Book and likely to foster "superstition" rather than "mysticism" led to sharp controversy with the Anglo-Catholic elements of his diocese and to wide discussion. The controversy was revived in an acute form in 1927 when a procession entered St. Paul's cathedral, where the bishop was preaching, to make a public protest against his views.

BARNES, JOSHUA (1654–1712), English scholar, was born in London on Jan. 10, 1654. Educated at Christ's Hospital and at Emmanuel College, Cambridge, he was in 1695 chosen regius professor of Greek. One of his first publications was entitled *Gerania; a New Discovery of a Little Sort of People, anciently discoursed of, called Pygmies* (1675), a whimsical sketch to which Swift's *Voyage to Lilliput* possibly owes something. Among his other works are a *History of that Most Victorious Monarch Edward III.* (1688), in which he introduces long and elaborate speeches into the narrative; editions of Euripides (1694) and of Homer (1711), also one of Anacreon (1705) which contains titles of Greek verses of his own which he hoped to publish. He died on Aug. 3, 1712, at Hemingford, near St. Ives, Hunts.

BARNES, ROBERT (1495?–1540), English reformer and martyr, born about 1495, was educated at Cambridge, where he was a member, and afterwards prior of the convent of Austin Friars, and graduated D.D. In the year 1526, he was brought before the vice-chancellor for preaching a heterodox sermon, and was subsequently examined by Wolsey and four other bishops. He was condemned to abjure or be burnt; and preferring the

former alternative, was committed to the Fleet prison and afterwards to the Austin Friars in London. He escaped thence to Antwerp in 1528, and also visited Wittenberg, where he made Luther's acquaintance. He also came across Stephen Vaughan, an agent of Thomas Cromwell and an advanced reformer, who recommended him to Cromwell: "Look well" he wrote, "upon Dr. Barnes' book. It is such a piece of work as I have not yet seen any like it. I think he shall seal it with his blood" (*Letters and Papers of Henry VIII.* v. 593). In 1531 Barnes returned to England, and became one of the chief intermediaries between the English Government and Lutheran Germany. In 1535, he was sent to Germany, in the hope of inducing Lutheran divines to approve of Henry's divorce from Catherine of Aragon, and four years later he was employed in negotiations connected with Anne of Cleves' marriage. The policy was Cromwell's, but Henry VIII. had already, in 1538, refused to adopt Lutheran theology, and the statute of Six Articles (1539), followed by the king's disgust with Anne of Cleves (1540), brought the agents of that policy to ruin. An attack upon Bishop Gardiner by Barnes in a sermon at St. Paul's Cross was the signal for a bitter struggle between the Protestant and reactionary parties in Henry's council, which raged during the spring of 1540. Barnes was forced to apologize and recant; and Gardiner delivered a series of sermons at St. Paul's Cross to counteract Barnes' invective. But a month or so later Cromwell was made earl of Essex, Gardiner's friend, Bishop Sampson, was sent to the Tower, and Barnes reverted to Lutheranism. It was a delusive victory. In July, Cromwell was attainted, Anne of Cleves was divorced, and Barnes was burnt (July 30, 1540). He also had an act of attainder passed against him, a somewhat novel distinction for a heretic, which illustrates the way in which Henry VIII. employed secular machinery for ecclesiastical purposes, and regarded heresy as an offence against the State rather than against the Church. Barnes was one of six executed on the same day: two, William Jerome and Thomas Gerrard, were, like himself, burnt for heresy under the Six Articles; three, Thomas Abel, Richard Fetherstone and Edward Powell, were hanged for treason in denying the royal supremacy. Both Lutherans and Catholics on the Continent were shocked. Luther published Barnes' confession with a preface of his own as *Bekenntnis des Glaubens* (1540), which is included in Walch's edition of Luther's *Werke*, xxi. 186.

See *Letters and Papers of Henry VIII.*, vols. iv.–xv., *passim*; Wriothesley's *Chronicle*; Foxe's *Acts and Monuments* (ed. G. Townsend); Burnet's *Hist. of the Ref.* (ed. Pocock); Dixon's *Hist. of the Church*; Gardiner's *Church in the XVIth Century*; Pollard's *Henry VIII. and Cranmer*; Herzog-Hauck, *Realencyklopädie*, 3rd edition.

BARNES, THOMAS (1785–1841), British journalist. Educated at Christ's hospital and Pembroke college, Cambridge, he was appointed (1817) editor of *The Times*, a position which he held until his death, when he was succeeded by Delane.

BARNES, WILLIAM (1800–1886), the Dorsetshire poet, was born on Feb. 22 1800, at Rushay, near Pentridge, in Dorsetshire, the son of John Barnes and Grace Scott, of the farmer class. He was a delicate child, in direct contrast to a strong race of forbears, and inherited from his mother a refined, retiring disposition and a love for books. He went to school at Sturminster Newton, where he was considered the clever boy of the school; and when a solicitor named Dashwood applied to the master for a quick-witted boy to join him as pupil Barnes was selected for the post. He worked with the village parson in his spare hours at classics and studied music under the organist. In 1818 he left Sturminster for the office of one Coombs at Dorchester, where he continued his evening education with another kindly clergyman. He also made great progress in the art of wood-engraving, and with the money he received for a series of blocks for a work called *Walks about Dorchester* he printed and published his first book, *Orra, a Lapland Tale*, in 1822. In the same year he became engaged to Julia Miles, the daughter of an excise officer. In 1823 he took a school at Mere in Wiltshire, and four years later married and settled in Chantry House, a fine old Tudor mansion in that town. He moved his school to Dorchester in 1835 and continued to conduct it until 1862, although he had become vicar of Whitcombe in 1847. From 1862 onwards he was rector of

Winterborne Came, where he died on Oct. 7 1886. In 1833 he began his poems in the Dorsetshire dialect, among them the two eclogues "The Lotments" and "A Bit o'Sly Coorten," in the pages of the local paper. His volumes of verse are *Poems of Rural Life in the Dorset Dialect*, two series 1844 and 1862; *Humely Rhymes* (1859), and *Poems of Rural Life in Common English* (1868). They were collected in a single volume in 1879. His poetry is essentially English in character; no other writer has given quite so simple and sincere a picture of the homely life and labour of rural England. His work is full of humour, and its rusticity is allied to a literary sense and to high technical finish.

Barnes was a lifelong student of philology and published in 1854 a *Philological Grammar*, in which he drew examples from more than 60 languages. His original and suggestive books on the English language, which are valuable in spite of their eccentricities, include *Se Gefylsta: an Anglo-Saxon Delectus* (1849); *Tiw* (1862); *A Grammar and Glossary of the Dorset Dialect* (1864); *An Outline of English Speech-Craft* (1878); and *A Glossary of the Dorset Dialect* (Dorchester, 1886).

BIBLIOGRAPHY.—See *The Life of William Barnes, Poet and Philologist* (1887), by his daughter, Lucy E. Baxter, who is known as a writer on art by the pseudonym of Leader Scott, and a notice by Thomas Hardy in the *Athenaeum* (Oct. 16, 1886).

BARNESVILLE, an incorporated village of Belmont county, Ohio, U.S.A., in the eastern part of the State, 20m. from the Ohio river, on the Baltimore and Ohio railroad. The population was 4,965 in 1920 (96% native white). Coal is mined near by, and the raising of Jersey cattle is one of the industries in which the region specializes. Among the many manufactures of the village are window glass, cut glass, car wheels, overalls, berry boxes, woollen goods and hosiery.

BARNET, residential district, Hertfordshire, England; 10m. north of London, served by the L.N.E. railway. The three chief divisions are as follows:—(1) CHIPPING or HIGH BARNET, a market town and urban district (Barnet). Pop. (1921) 11,772. The second epithet denotes its position on a hill; the first derives from the market ("cheaping") granted to the abbots of St. Albans by Henry II. An obelisk marks the field of a battle fought during the Wars of the Roses. There are paper works and metal works in the neighbourhood. The town is on the Great North road on which it was formerly an important coaching station; a large annual horse fair is still held. The Barnet By-Pass road (1927) runs near the town. (2) EAST BARNET 2m. south of Chipping Barnet has a church containing specimens of Norman architecture. This region is a residential area for London. Pop. of urban district (1921) 13,514. (3) NEW BARNET lies 1m. east by south from Chipping Barnet. FRIERN BARNET, urban district, Middlesex, lies 3m. south of Chipping Barnet. Pop. (1921) 17,375. The prefix recalls the former lordship of the manor held by the friary of St. John of Jerusalem in Clerkenwell, London. Friern Barnet adjoins Finchley on the north and Whetstone on the south. The district is residential for London, and has many workers in wood and metal. (X.)

Battle of Barnet.—The battle fought at Barnet between Yorkists and Lancastrians on April 14, 1471, actually decided the issue of the long-protracted English Wars of the Roses, though it was not until Tewkesbury, three weeks later, that the last effort of the Lancastrian forces was crushed. After Barnet the Yorkist Edward IV. entered the capital as king, leaving his powerful enemy, Warwick the kingmaker, dead upon the field, and the subsequent murder in the Tower of London of the rightful sovereign, Henry VI., made his throne secure. Edward had been driven from the country the previous year. He landed with a small expedition on the Yorkshire coast, whereupon it became between Yorkists and Lancastrians a contest of march and manoeuvre to reach London first. Edward arrived before the city walls on April 11, and by treachery within the gates were opened to him. He stayed only two days, to pray at St. Paul's for victory and to take out the feeble Henry VI. as a hostage in his camp, after which he doubled back to find the Lancastrian army, led by Warwick, drawn up for battle facing London, upon a plain "half

a mile from Barnet" (*Paston Letters*). The battlefield can be accurately identified as Hadley Green.

The battle took place on the morning of Easter Day, in dense mist, the armies closely confronting one another. Edward had moved his troops forward at nightfall, determined that his enemy should not escape. Fortune at the outset favoured the Lancastrians. The Earl of Oxford and Lord Montagu, commanding a strong body of horse, crushed the Yorkist left wing, driving the force before them off the field and back through Barnet town towards Enfield Chase. The first news received in London was that the Yorkist cause was lost. The pursuit was carried too far, and the soldiers stayed to plunder. Oxford, guided by the noise of battle, led his troops back, and wheeling in the fog after having reissued from the houses of Barnet, he suddenly found himself brought up against a strong body of archers, who shot into his ranks. It was the Lancastrian centre, largely composed of the Duke of Somerset's retainers. Much execution was done before the mistake was realized, and when at length recognition was made each party suspected treacherous desertion to the Yorkists in the other, and the fratricidal killing continued. Edward, informed of the cause of the mêlée on his front, launched his reserves in full strength against the Lancastrians' confused ranks, which were pierced and broken. Somerset, now convinced of treachery, fled with the Lancastrian centre in one direction, Oxford in another, leaving the Earl of Warwick and the left wing to be surrounded and cut down by the exultant Yorkists. Edward hurriedly made for London, having ordered that no quarter should be given to the common soldiers in the pursuit. An obelisk on Hadley Green marks the traditional spot where Warwick fell. Sir John Paston, who fought with the Lancastrians, computed the killed on both sides at "more than a thousand." (W. G. B.)

BARNETT, JOHN (1802–1890), English musical composer, son of a Prussian named Bernhard Beer, who changed his name on settling in England as a jeweller, was born at Bedford, July 15, 1802, and at the age of 11 sang on the Lyceum stage in London. In 1834 he published a collection of his songs, *Lyrical Illustrations of the Modern Poets*. His *Mountain Sylph*—the musical drama with which his name is chiefly connected—was well received at the Lyceum on Aug. 25, 1834; it was followed by *Fair Rosamund* in 1837, and, after an interval spent in study at Frankfurt, by *Farinelli* in 1839. After an unsuccessful attempt to establish opera at the St. James's theatre (1839) Barnett settled as a singing-master at Cheltenham. He died on April 16, 1890.

His nephew, JOHN FRANCIS BARNETT (1837–1916), son of John's brother, Joseph Alfred, also a professor of music, was an accomplished pianist, and also a composer. His most important work, an oratorio, *The Raising of Lazarus*, was written in 1873, and produced at Hereford in 1876.

BARNETT, SAMUEL AUGUSTUS (1844–1913), English clergyman and social reformer, born at Bristol on Feb. 8, 1844, the son of Francis Augustus Barnett, an iron manufacturer, visited, after leaving Wadham college in 1866, the United States. Next year he became curate of St. Mary's, Bryanston Square, and in 1872 vicar of St. Jude's, Whitechapel. In the next year he married Henrietta Octavia Rowland, a co-worker with Miss Octavia Hill. Mr. and Mrs. Barnett toiled for the poor of their parish, opening evening schools for adults, providing music and other entertainment, serving on the board of guardians and the school committees, and discouraging outdoor relief, as tending to pauperization; the conditions of indoor relief were improved, and various charities co-ordinated, with the help of the Charity Organization Society and the board of guardians. In 1875 Arnold Toynbee paid a visit, the first of many, to Whitechapel, and Mr. Barnett, who kept in touch with Oxford, formed in 1877 a committee to organize university extension in London, his assistants being Leonard Montefiore, a young Oxford man, and Frederick Rogers, a member of the vellum binders' trade union. The committee received much support, and in October four courses of lectures, one by Dr. S. R. Gardiner on English history, were given. The Barnetts also furthered the building of model dwellings, the establishment of the children's country holiday fund and annual loan exhibitions of fine art at the Whitechapel gallery. In 1884 an article by Mr. Bar-

nett in the *Nineteenth Century* on University Settlements, led in July to the formation of the University Settlements Association; Toynbee Hall was founded at a meeting in Balliol college (1884): Mr Barnett was its first warden. He was select preacher at Oxford (1895-97) and at Cambridge (1900); he became canon of Bristol in 1893, but retained his wardenship of Toynbee Hall. In June 1906 he was made a canon of Westminster and when in December he resigned the wardenship of Toynbee Hall the position of president was created for him. He died on June 17, 1913. Among Canon Barnett's works is *Practicable Socialism* (1888, 2nd ed. 1894), written with the aid of his wife, who after his death was created for her great public services, a D.B.E. Dame Henrietta has written her husband's life (2 vols. 1918).

BARNFIELD, RICHARD (1574-1627), English poet, was born at Norbury, Staffs, and baptized on June 13, 1574. In 1589 he went to Brasenose college, Oxford, where he graduated in 1592, but he seems to have left the university abruptly without proceeding to the M.A. His first work, *The Affectionate Shepherd*, was published in Nov. 1594, dedicated to Penelope, Lady Rich; and a second volume, *Cynthia, with certain Sonnets*, dedicated to William Stanley, earl of Derby, followed it two months later. "Cynthia" itself, a panegyric on Queen Elizabeth, claimed to be "the first imitation of the verse of that excellent poet Maister Spenser in his Fayrie Queene." In 1598 Barnfield published his third and last volume, *The Encomion of Lady Pecunia*, of which a second edition appeared in 1605. Henceforward he seems to have broken off all commerce with the Muse, and lived as a country gentleman on his estate of Dorlestone, Staffs, where he died.

The most interesting fact about Barnfield is his connection with Shakespeare, whose earliest imitator he may be said to have been. The sonnets published in his second volume are closer to Shakespeare's sonnets in manner than any others of the Elizabethan age, while two of the poems in his third volume—the sonnet "If Music and sweet Poetry agree" and the ode beginning "As it fell upon a day," both of which appeared in *The Passionate Pilgrim* in 1599—were long believed to be Shakespeare's work. If only by virtue of these two pieces, Barnfield deserves to be remembered as one of the most interesting minor Elizabethans.

BIBLIOGRAPHY.—Barnfield's complete poems were first edited by Grosart in 1876 for the Roxburgh club. An edition by Edward Arber was published in 1883.

BARNIM, the name of thirteen dukes who ruled over divisions of the duchy of Pomerania. The following are the most important:

BARNIM I. (c. 1209-1278), called the *Good*, was the son of Bogislaus II., duke of Pomerania-Stettin, and succeeded to this duchy on his father's death in 1220. In 1250 he was compelled to recognize the supremacy of the margrave of Brandenburg. Barnim introduced German settlers and customs into the duchy, founded many towns, and was extremely generous towards ecclesiastical foundations.

BARNIM III. (c. 1303-1368), called the *Great*, was the son of Otto I., duke of Pomerania-Stettin, and took a prominent part in the defence and government of the duchy before his father's death in 1344. A victory gained by him in August 1332 freed Pomerania for a time from the vexatious claim of Brandenburg to supremacy over the duchy, which, moreover, he extended by conquest. Barnim assisted the emperor Charles IV. in his struggle with the family of Wittelsbach.

BARNIM XI. (1501-1573), son of Bogislaus X., duke of Pomerania, became duke on his father's death in 1523. He ruled for a time in common with his elder brother George; and after George's death in 1531 he shared the duchy with his nephew Philip I., retaining for himself the duchy of Pomerania-Stettin. In 1529 a treaty was made which freed Pomerania from the supremacy of Brandenburg on condition that if the ducal family became extinct the duchy should revert to Brandenburg. Barnim adopted the Lutheran doctrine and joined the league of Schmalkalden, but took no part in the subsequent war. But he was compelled to accept the *Interim*, issued from Augsburg in May 1548. In 1569 Barnim handed over his duchy to his grand-nephew, John Frederick.

'BARNIM, a district in Germany, between the Spree, the Oder and the Havel, which was added to the mark of Brandenburg during the 13th century.

BARN MACHINERY: see FARM MACHINERY.

BARNLEY (BLACK or properly BLEAK BARNLEY), parliamentary and county borough, West Riding of Yorkshire, England, 15m. N. of Sheffield. Pop. (1891) 35,427; (1921) 53,661; of the extended county borough (estimated 1924) 70,170. It is served by the L.M.S. and L.N.E. railways, and situated on rising ground west of the river Dearne and in the old parish of Silkstone, which has become an important local name. In Domesday Ilbert de Lacy held Barnley by gift of William the Conqueror as part of the honour of Pontefract, and the overlordship remained in his family has become an important local name. In Domesday Ilbert de Lacy to the monks of Pontefract. Henry III. granted the prior and convent of Pontefract a market every Wednesday at Barnley, and a fair on the vigil and feast of St. Michael and two following days, and Henry VIII. granted them a new fair on the day of the Conversion of St. Paul and two following days. The monastery evidently also held another fair there called St. Ellen's fair, for in 1583 Queen Elizabeth granted this fair and St. Paul's fair and the market "lately belonging to the dissolved monastery of Pontefract" to one Henry Burdett and his sons. Before 1744 the chief industry had been wire-drawing, but this trade began to decrease about the end of the 18th century just as the linen trade was becoming important. With the development of the coalfield in the vicinity the importance of Barnley grew enormously. The coal was used locally in textile mills and much exported, with coke, to London. The majority of workers in Barnley are still employed in the coal mines. Iron, steel, and glass are important subsidiary industries, and there are also bleachfields, printfields and sawmills. The town has connections with the Aire and Calder Navigation-system of canals. The parish church of St. Mary was built in 1821 on an early site; the free grammar-school dates from 1605, and a philosophical society was founded in 1828. The park was presented in 1862 by the widow of Joseph Locke, M.P. Near the town is Monk Bretton Priory, a Cluniac foundation of 1157 retaining a Perpendicular gatehouse, some Decorated domestic remains, and fragments of the church. Barnley was incorporated in 1809 and made a county borough in 1913. It is governed by a mayor and council of 36 members. Since 1918 Barnley together with some outlying urban districts has returned one member to parliament. Area of county borough (1921) 2,385 acres, after extension (1924) 6,032 acres.

BARNSTABLE, a seaport town and the county seat of Barnstable county, Mass., U.S.A., extending across Cape Cod. It is served by the New York, New Haven and Hartford railroad. The population in 1925 was 5,774.

Cranberries are cultivated extensively, and the fishing industry, including the raising of Cotuit oysters, is important. The principal economic interests, however, centre around the entertainment of summer visitors. Hyannis, the largest village and general business centre for the whole cape, is the seat of a State normal school (established 1897) and of the Cape Cod hospital (1920). Each of the 14 villages has its own public library and public hall.

Barnstable was settled and incorporated in 1639. It was the birthplace of James Otis and Lemuel Shaw.

BARNSTAPLE, seaport and municipal borough, near the north coast of Devonshire, England. Pop. (1921) 14,409. It stands on the estuary of the Taw, here crossed by a stone bridge of 16 arches said to date from the 12th or 13th century. Barnstaple (Berdestaple, Barnstapol, Barstaple, also Barum) ranks among the most ancient of royal boroughs. As early as Domesday, where it is several times mentioned, there were 40 burgesses within the town and nine without, who rendered 40s. Tradition claims that King Athelstan threw up defensive earth-works here, but the existing castle is attributed to Joel of Totnes, who held the manor during the reign of William the Conqueror, and also founded a Cluniac priory, dedicated to St. Mary Magdalene. From this date the borough and priory grew up side by side, but each preserved its independent privileges and rights of government until the dissolution of the latter in 1535. The earliest authenticated charter

is that of Henry I., which was confirmed in a charter of Henry II. stating that the burgesses should have customs similar to those granted to London. A charter of 1556 added some new privileges, one of 1610 increased the number of chief burgesses to 25, and this charter held force until the Municipal Corporation Act of 1835. Barnstaple was once famous for its woollen trade, now entirely declined, and as early as the reign of Edward III. it was an important naval port. The Friday market and the annual four days' fair in September are held by immemorial prescription. The grammar school was founded in the 14th century. There are also some curious Jacobean almshouses. The harbour admits only small coasting vessels. The town manufactures lace and gloves, and has extensive potteries and foundries. Cabinet making and some boatbuilding are carried on. The town is served by the G.W.R. and the S.R.; Barnstaple junction is a considerable station on the latter. The borough is under a mayor, six aldermen and 18 councillors. Area 2,235 acres. It is in the Barnstaple parliamentary county division.

BARNUM, PHINEAS TAYLOR (1810-1891), American showman, was born in Bethel, Conn., on July 5, 1810, his father being an innkeeper and storekeeper. Barnum first started as a storekeeper, and was also concerned in the lottery mania then prevailing in the United States. After failing in business, he started in 1829 a weekly paper, *The Herald of Freedom*, in Danbury. In 1835 he began his career as a showman, with his purchase and exploitation of a coloured woman, Joyce Heth, reputed to have been the nurse of George Washington, and to be more than 160 years old. With this woman and a small company he made well advertised and successful tours in America till 1839, though Joyce Heth died in 1836, when her age was proved to be not more than 70. After a period of failure, he purchased Scudder's American Museum, New York, in 1841. Here he made a special hit by the exhibition, in 1842, of Charles Stratton, the celebrated "General Tom Thumb" (see DWARF). In 1850 he toured America with Jenny Lind, who was engaged to sing at \$1,000 a night for 150 nights, all expenses being paid by the *entrepreneur*. In 1871 he established the "Greatest Show on Earth," a travelling amalgamation of circus, menagerie and museum of "freaks," etc. This show, incorporated in the name

ELEPHANTINE AGRICULTURE, A BARNUM METHOD OF ADVERTISING

In order that his circus might not be forgotten while it was in winter quarters at Bridgeport, Conn., Barnum had a man dressed in oriental costume daily to plough a field by elephant power. The field was within sight of a railroad and the ploughing was done only when a train went past.

of "Barnum, Bailey and Hutchinson," and later as "Barnum and Bailey's" toured all over the world. In 1907 the business was sold to Ringling Brothers. Barnum wrote several books, such as *The Humbugs of the World* (1865), *Struggles and Triumphs* (1869), and his *Autobiography* (1854, and later editions). He died on April 7, 1891.

BIBLIOGRAPHY—Morris R. Weiner, *Barnum* (1923); Harvey W. Roat, *The Unknown Barnum* (1927).

BAROCCHIO or **BAROZZI, GIACOMO**, called DA VIGNOLA (1507-1573), Italian architect, was born at Vignola in the Modenese territory on Oct. 1, 1507, and died in Rome on July 7, 1573. In 1564 he succeeded Michelangelo as the architect of St. Peter's, and executed various portions of that fabric, besides

a variety of works in Rome. The designs for the Escorial were also supplied by him. He is the author of a work on the *Five Orders of Architecture* (Rome, 1563), and another on *Practical Perspective* (Rome, 1583).

BAROCCI or **BAROCCIO, FEDERIGO** (1528-1612), Italian painter, was born and died at Urbino. He studied under Battista Franco at Urbino, copied some works by Titian at Pesaro, and in 1548 went to Rome, where he came under the influence of Raphael. The greater part of his life was spent at Urbino, but he spent several periods in Rome. His best works are "The Visitation of the Virgin Mary to Elizabeth" and the "Presentation in the Temple," painted for the Chiesa Nuova in Rome.

BAROCCO, a variant spelling of the word baroque (see BAROQUE ARCHITECTURE) indicating generally the late and luxurious Renaissance styles.

BARODA, one of the five most important Indian States, within the Gujarat province of Bombay, but in direct relations with the governor-general. It consists of four isolated divisions interlaced with British territory or with other Indian States. Three of these divisions—Kadi, Baroda and Nausariare in Gujarat proper; the fourth, Amreli with Okhamandal, is in the peninsula of Kathiawar. The total area covers 8,127 square miles. In 1921 the population was 2,126,522.

The princes of Baroda were one of the chief branches of the 18th century Mahratta confederacy. About 1721 one Pilaji gaekwar carved a fertile slice of territory out of Gujarat, and afterwards received the title of "Leader of the Royal Troops" from the peshwa. In 1800 the inheritance descended to a prince feeble in body and almost idiotic in mind. British troops were sent in defence of the hereditary ruler against all claimants; a treaty was signed in 1802, by which his independence of the peshwa and his dependence on British Government was secured. For some time the history of the gaekwars was very much the same as that of most territorial houses in India: an occasional able minister, more rarely an able prince; but, on the other hand, a long dreary list of incompetent heads, venal advisers and taskmasters oppressive to the people. In 1874 an attempt at poisoning the British resident led to the gaekwar Malhar Rao being formally accused of the crime and tried by a mixed commission. The result of the trial (1875) was a failure to obtain an unanimous verdict on the charge of poisoning; the viceroy, Lord Northbrook, however, decided to depose Malhar Rao on the ground of gross misgovernment, the widow of his brother and predecessor, Khande Rao, being permitted to adopt an heir from among the descendants of the founder of the family. During the boy's minority the state was for eight years under the charge of Sir T. Madhava Rao, formerly diwan of Travancore, one of the ablest and most enlightened of Indian statesmen. The result was a conspicuous success. The present gaekwar has repeatedly visited Europe in company with his wife. In 1887 Queen Victoria conferred upon him at Windsor the insignia of G.C.S.I., and in 1892 upon his wife the Imperial order of the crown of India.

The gross revenue of the State is nearly one and a quarter million sterling. In 1901 the State currency of Babashai rupees was withdrawn, and the British rupee was introduced. The regular military force consists of a field battery, with several regiments of cavalry and battalions of infantry. In addition, there is an irregular force of horse and foot. Compulsory education has been carried on experimentally since 1893 in the Amreli division with apparent success, the compulsory age being 7 to 12 for boys and 7 to 10 for girls. Special measures are also adopted for the education of low castes and aboriginal tribes. There is a female training college under a Christian lady superintendent. The Kala Bhavan, or technical school, has departments for drawing, carpentry, dyeing, weaving and agriculture. There is also a State museum under a European director and a State library.

The city of Baroda is situated on the river Viswamitri, a station on the Bombay and Baroda railway, 245m N of Bombay by rail. Pop. (1921) 94,712. The whole aspect of the city has been changed by the construction of handsome public buildings, the laying-out of parks and the widening of the streets. An excellent water-supply is provided from the Ajwa lake. The canton-

ments, garrisoned by a native infantry regiment, are under British jurisdiction, and have a population of 4,000. The city contains a college and many schools. The chief hospitals are called after the countess of Dufferin, Sayaji Rao and Jamnabai, the widow of Khande Rao.

BAROJA, PÍO (1872—), Spanish novelist, was born at San Sebastian. Impersonal, pessimistic and chillingly intellectual, Baroja deals by preference with the rebels and pariahs of the world. He attempts no idealization: his works are even, at times, reminiscent of the picaresque novel. His style is direct and unpolished: his matter rarely fails to interest. Among his best known works are *La Lucha por la Vida* (1904), *La Tierra Vasca* (1909), and *Las Ciudades* (1920). Latterly he has been engaged upon a long series of historical episodes, entitled *Memorias de un hombre de acción*, whose hero is the historical personage Eugenio de Aviraneta.

BAROMETER. The earliest forms of barometer were developed from the well known experiment performed in 1643, by Torricelli, who, conceiving the idea that the atmosphere had weight, used a mercury column long known, after him, as the "Torricelli tube," for the purpose of demonstrating the existence and magnitude of the atmospheric pressure.

Fundamental Principles.—In the measurement of pressure differences the fundamental idea is to balance this difference against a column of liquid whose weight is known in terms of its height, density and the value of gravity acting upon it. The principle is familiar, and sufficiently well indicated in the diagrams, figs. 1, 2 and 3, in which the weight of the liquid column between the levels A and B balances the differences of air pressures on the two liquid surfaces A and B. By closing the end of the tube above A in fig. 1, and completely exhausting the space in the tube above A of all gas and vapour (except the vapour of the liquid), the liquid column can be used to measure the pressure of the air at the level B, and the manometer of fig. 1 becomes the barometer of fig. 2. The present forms of liquid barometer for measuring atmospheric pressures are based on the principle of fig. 2 or fig. 3.

Mercury is practically the only liquid that can be used conveniently in barometers which measure atmospheric pressures. Owing to its high specific gravity the barometric column is not unduly long. The vapour pressure of mercury is so small that its effect can ordinarily be neglected in the measurement of atmospheric pressures.

There is an alternative type of barometer, called the aneroid (or non-liquid) barometer, which is dependent on the elastic properties of a thin flexible-walled evacuated capsule in combination with a stiff spring. The credit for the invention of the aneroid is usually given to Vidi, who patented his instrument in 1845, but similar instruments were in use much earlier. This instrument is not susceptible of the same high order of accuracy as a mercurial barometer, but it offers the advantage of considerably greater portability.

Units of Measurement of Pressure.—Until comparatively recently it was the usual practice to graduate barometers in inches or millimetres, or in both units. There is, however, a third unit which is now frequently employed in the case of barometers used for meteorological work. This unit is the *bar*, defined as the pressure of one million dynes per sq. cm. The *bar* is a unit of pressure, but it appears on the scale of a meteorological barometer as a pseudo-unit of length, in such a way that the barometric height, when measured in this unit and corrected to suitable standard conditions, is ultimately expressed in true units of pressure.

It sometimes becomes necessary, e.g., in gasometry, to reduce experimental results so as to relate to some standard pressure, and for this purpose the pressure of a *standard atmosphere* has been defined as the pressure due to the weight of 760 mm. of mercury at 0°C. under standard gravity.

The expression "standard atmosphere" is to some extent ambiguous. While this definition holds good generally for physical and chemical purposes, the meteorologist is inclined, at least for some purposes, to regard his standard atmosphere as 1 *bar*, which is approximately 750 mm. of mercury. However, among American chemists and physicists the *bar* is defined as 1,000,000 times smaller than this value.

Chief Types of Mercurial Barometer.—The different types of mercurial barometer vary largely with the method employed to measure the difference in height between the levels, A and B, shown in figs. 2 and 3. Both these levels change with variation of pressure. One of the earliest ideas was to make the level B (fig. 3) in the reservoir adjustable to the zero of a fixed scale which is used to give a direct reading of the level of A above B. A serviceable barometer of this type was devised early in the 19th century and is known as Fortin's barometer. It is still in ordinary use. Alternatively the scale itself may be made adjustable so that its zero is raised or lowered to the level B of the mercury in the reservoir, the final reading of the barometric height being taken at A as before. This type, an example of which is Newman's barometer, introduced in 1840, is not very extensively used.

A third type of instrument, introduced at a somewhat later date, avoids the direct use of a scale zero and gives a reading of the barometric height by means of a single setting. This type is known as a Kew pattern barometer, and makes use of the fact that changes in pressure produce proportionate changes in the level A. By using a scale with an appropriate contracted spacing, the instrument can be compensated so as to allow for the changes in level B of the mercury in the reservoir. This general type of instrument was originally devised for use at sea, but it is now also in frequent service on land.

The Fortin Barometer.—A general view of a modern Fortin barometer is given in fig. 4. The distinctive features of this type of instrument is Fortin's arrangement for controlling the lower level of the mercury by means of a leather bag which forms the lower part of the reservoir of the barometer. Incidentally by this means, the mercury can be made to fill the tube and cistern of the instrument if desired, thus making the barometer easily portable. Fig. 5 illustrates the present form of design of a Fortin cistern, from which the mercury has been removed. The normal procedure in reading this instrument is to use the adjusting screw at the lower end of the barometer in order to raise the mercury in the reservoir so as just to touch an ivory point which is fixed to the ceiling of the cistern and serves as the zero of the barometer. The barometric height is then determined by reading the level of the highest part of the mercury column by means of the scale and vernier. The temperature of the barometer should also be recorded. Provision is made for ensuring a complete and quick communication of the external atmosphere with the interior of the cistern. The glass barometer tube, necessarily closed at the upper end, which is usually about 33 in. above the fiducial point, is in England usually made of lead glass. It is surrounded by a metal sheath, suitably slotted in order to admit of viewing the summit of the mercury column in the glass tube. On this sheath is engraved the scale used for reading the barometer. The slots in the sheath provide a run for the vernier

FIGS. 1-3.—FUNDAMENTAL HYDROSTATIC PRINCIPLE OF MEASURING PRESSURE

FIG. 4.—MERCURY BAROMETER (FORTIN TYPE)

slide used in reading the top of the barometric column. The bore of the tube may vary from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. in different instruments. The length of the graduated scale on the sheath depends on the station at which the barometer is to be used. At sea-level the maximum range of variation in atmospheric pressure is from 31.1 to 27.3 in. of mercury. Consequently for use at stations near sea-level a nominal working range of about 31 to 27 in. (790 to 690 mm., or 1,050 to 920 millibars) is sufficient. The scale, however, must be subdivided above the upper limit to a distance dependent on the length of the vernier used in reading fractions of a scale division. If the barometer is to be used in a mine, the upper limit must be increased, following the increase of atmospheric pressure with the depth of the mine. The lower limit of the scale is governed by the maximum altitude at which the instrument is to be used. Fortin type barometers are rarely made to read lower than 20 in. unless designed specifically for use in mountaineering or high-altitude surveying.

FIG. 5—CISTERN OF MERCURY BAROMETER (FORTIN TYPE)

curry in the cistern corresponding to a given pressure change is a definite fraction of the change in level of the summit of the mercury column, the value of this fraction depending on the dimensions of the instrument.

It will readily be seen that the movement in the tube is always smaller than that which would be obtained if the mercury in the cistern were brought to a fiducial point. Accordingly the scale of the Kew barometer is contracted, but the amount of this contraction is not large, and a nominal pressure-inch of scale rarely measures less than 0.95 true inch. The cistern is usually of cast iron, but stainless steel has recently been tried for this purpose. The lower end of the glass barometer tube is situated as nearly as possible at the centre of the cistern in order that it may be effectively sealed by the mercury in all positions of the instrument, whether erect, horizontal or inverted.

A Kew barometer, unless of exceptional size or design, is usually made portable by carefully tilting it until the mercury fills the tube completely. It may then be transported either horizontally, or cistern upward, the latter condition being preferred.

Mercurial barometers have to be specially constructed for use on board ship. As the oscillation of the mercury is a serious obstacle to reading the barometer, the glass tube is constricted so as to oppose the flow of mercury through it. The amount of constriction is arranged to compromise between the error due to oscillation, or "pumping" as it is technically called, and the error due to the lag of the mercury column in following the variations of atmospheric pressure.

FIG. 6—CISTERN OF MERCURY BAROMETER (KEW PATTERN)

Mercurial marine barometers are usually of the Kew pattern. The glass barometer tube shown in fig. 7 may be regarded as illustrating both a Kew barometer and a marine barometer. In Kew barometers, there is usually a funnel-shaped air-trap A designed so as to collect at A any air that may rise into the barometer tube from the cistern, and to prevent it from reaching the vacuum space above the mercury column. The central portion S of the glass tube is usually of diminished bore in all Kew barometers, whether used on land or at sea. In marine barometers the bore is so diminished as to constitute a constriction. In land barometers this diminution is made in order to economize mercury, and should

FIG. 7—TUBE OF A KEW PATTERN BAROMETER

not be such as to impede the flow of the mercury considerably, or render the barometric column sluggish in taking up equilibrium with the atmospheric pressure.

Reduction of Barometric Readings to Standard Conditions.—Since the indications of a mercury barometer are influenced by changes of temperature of the instrument, and of gravity acting on the mercury, corrections are normally made for these changes in order to obtain absolute values of the pressure

Owing to the relatively high thermal expansibility of mercury the correction for temperature is important, being approximately $\frac{1}{10}$ in. for a barometer reading 30 in. of mercury, corresponding to a change in temperature of 33°F. There is further a small difference between the temperature corrections to the Kew and Fortin types of barometer

It is usual, in the case of inch and metric barometers, to correct the readings so as to refer to mercury at 32°F (0°C.) and at standard gravity, the latter being regarded as the value of gravity at mean sea-level in latitude 45°. If the pressure and temperature are constant, the height of the barometric column varies inversely as the value of gravity at the station where the barometer is read. Full particulars and instructions for the correction of barometer readings to standard conditions will be found in the books of meteorological tables referred to in the bibliography.

A useful variation in the procedure of correction has been made in the case of mercury barometers with scales graduated in millibars. The gravity correction is expressed in terms of temperature in such a way that corresponding to any given station the temperature is found at which the instrument reads absolute pressures in true millibars. This temperature is called the fiducial temperature, and in practice it is only necessary to apply a correction for the departure of the temperature of the barometer at the time of reading from the fiducial temperature.

A mercurial barometer indicates the pressure of the air at the level of its cistern. In meteorological work, such as the mapping of isobars for weather forecasting, it is not the pressure at cistern level that is finally required, but the corresponding atmospheric pressure at mean sea-level at a point vertically below the barometer. Consequently a correction has to be made for the difference in atmospheric pressure between station-level and sea-level.

Accuracy of Mercurial Barometers.—It is not possible within the limits of this article to discuss in detail the different sources of error which may affect the accuracy of a mercury barometer. Much depends on the dimensions and type of barometer used. Increased accuracy is usually obtained by increasing the diameter of the glass barometer tube up to certain limits depending on the purpose for which the instrument is required. Barometers with a narrow tube (e.g., less than $\frac{1}{16}$ in. in internal diameter) can scarcely be called precision instruments, as the amount of capillary depression of the barometric column due to the forces of surface tension acting at the mercury meniscus varies considerably. Even in tubes of the size ordinarily used some variation in accuracy may be attributable to variation in capillary depression.

In general the Fortin type of barometer has a slight advantage over the Kew pattern in accuracy and permanence. This is especially the case with instruments having a tube of small internal diameter. With suitable precautions the Kew barometer can be made to yield an accuracy as great as that of a Fortin instrument of similar dimensions. In many classes of work it is preferable to use a Kew barometer and gain the advantage which this type offers in giving the barometric height by means of a single setting. If continuous accuracy over a period of several years is important, preference should be given to the Fortin type.

The following table indicates the general degree of consistency obtainable from a mercury barometer under good conditions of use.

Internal diameter of barometer tube.	Degree of consistency obtainable from the barometer in the measurement of pressure.		
inches.	inches.	millimetres.	millibars.
0.25	0.005	0.12	0.16
0.4	0.002	0.05	0.07
0.5-0.6	0.0015	0.03	0.04

Special accuracy may be obtained by taking particular precautions in methods of measurement and in the design of the barometer, particularly in the use of a tube of large diameter. A fundamental standard barometer has recently been constructed at the National Physical Laboratory, Teddington, Middlesex, to measure atmospheric pressures to within 0.01mm. of mercury.

Aneroid Barometers.—The aneroid barometer is often used as a substitute for a mercurial barometer under conditions in which the use of the latter is not admissible.

Fig 8 shows the general arrangements of the mechanism of an aneroid. A corrugated chamber, formed by two thin metal diaphragms, is the fundamental element of an aneroid, and is technically called the vacuum box, since it is usually thoroughly exhausted of air. It is bolted to the base-plate of the instrument (see the sectional view in fig. 9), and connected to a steel spring which controls the stiffness of the combination. This spring is mounted so that it tends to open the box by pulling strongly upwards. A decrease in the atmospheric pressure causes the diaphragm box to expand. Consequently the point at which the box is anchored to the spring will move upwards (fig. 9), relatively to the base-plate of the instrument. The amount of this elastic movement caused by a change in air pressure is relatively small. It is of the order 0.005in. (linear) in an average diaphragm box,

BY COURTESY OF MESSRS. SHORT AND MASON, LTD.

FIG 8.—GENERAL VIEW SHOWING THE MECHANISM OF AN ANEROID BAROMETER

corresponding to a change in pressure equal to 1in. of mercury. The instrument, however, gives a considerably magnified indication of this movement, which is linked up by a system of levers connected with a fine metallic chain which rotates the spindle on which the indicating needle is mounted. Nickel-silver alloy is most frequently employed for the diaphragms of vacuum boxes, but steel has also been used with considerable success.

Aneroid barometers are usually designed to read pressures with a precision which varies from 0.01in. to 0.05in. of mercury ac-

cording to the size and range of the movement. A nominal inch of mercury, as shown on the average aneroid scale, usually measures at least a linear inch (sometimes more), and corresponds to a magnification of about 200 times the movement of the vacuum box. The aneroid form of barometer can readily be made self-registering, and fig 10 illustrates one of the usual types of barograph. It is a general practice in making barographs to insert a suitable control spring inside each vacuum box, instead of using the external type of spring fitted to indicating aneroids. The main

FIG. 9.—SECTIONAL VIEW OF VACUUM-BOX AND CONTROL SPRING OF AN ANEROID

features of the mechanism of the indicating aneroid are retained, except that the metallic chain operating the indicating needle is replaced by a long pen lever, which traces out the record on a uniformly revolving drum driven by clockwork.

The different effects of temperature changes on the reading of an aneroid barometer are sufficiently marked to necessitate compensation in aneroids generally. They are twofold in character, for in addition to the thermal expansion of the aneroid mechanism, particularly the diaphragms and main spring, there is a thermal change in the elasticity of the material of these parts.

Commercially, an aneroid is called "compensated" if it has some device in it which will make the reading independent of the temperature at such pressures as occur at sea-level (i.e., at about 30in.).

Although an aneroid is sensitive to small changes of pressure, its reading cannot be relied upon to give the absolute value of the

FIG 10.—A COMMON TYPE OF ANEROID BAROGRAPH, THE SELF-REGISTERING ANEROID BAROMETER

pressure to a precision corresponding to one subdivision of the scale of the instrument (0.01in. for short ranges to 0.05in. for long ranges).

The utility of the aneroid as an absolute pressure indicator is limited by gradual and appreciable changes in the internal structure of the metal of the vacuum box, and for this reason it is highly advisable to compare the reading of an aneroid with that of a reliable mercury barometer at suitable intervals of time in order to avoid errors due to temporary or secular changes in the mechanism. Most important of all the defects to which an aneroid is susceptible is that generally known as "creep," which occurs when an aneroid, which has reached a steady condition at one pressure, is submitted to a different one. Although an aneroid

responds readily to a change in pressure, the diaphragms do not remain steady at the new pressure, but show a further small but gradual change in the same direction, in the course of time, while the same pressure is maintained.

Practical Uses of the Barometer.—A good mercurial barometer is an essential part of the equipment of most laboratories owing to the number of different scientific measurements which are dependent on a knowledge of the atmospheric pressure. Systematic use of barometers and other instruments is made on a wide scale by the Meteorological Office, which is responsible for the collection of information required for weather forecasting. Barometric readings are regularly taken on land and at sea over a wide area of the earth's surface in order to map the distribution of atmospheric pressure near the earth's surface.

A considerable amount of work has been done with aneroid barometers in the investigation of the meteorology of the upper atmosphere. Apart from the measurement of pressure, there is also a wide field for the use of a barometer in the determination of heights. Barometers are very sensitive to a change in height.

A change in altitude of 1,000ft., measured from sea-level corresponds approximately to a pressure change of one inch of mercury. The relation between height and pressure depends to a considerable extent on the temperature of the atmosphere, and although barometers are furnished with scales of altitude for the direct measurement of differences of height, such scales cannot be regarded as accurate under widely different atmospheric conditions. In general they represent some conventional relation between height and pressure, which needs further correction if accurate heights are to be obtained. There are a number of different conventional scales in use in England and other countries. Altimeter aneroids, adjustable so as to measure height above a convenient starting level, are in general use in aircraft.

The following table represents approximate average values of the atmospheric pressure at the respective heights above sea-level:—

Height (feet) above sea-level.	Corresponding pressure (inches of mercury reduced to standard conditions).	Height (feet).	Corresponding pressure (inches of mercury reduced to standard conditions).
—1,000*	31.02	14,000	17.58
0	29.92	15,000	16.80
1,000†	28.86	16,000	16.22
2,000	27.82	17,000	15.57
3,000	26.82	18,000	14.94
4,000	25.84	19,000	14.34
5,000	24.90	20,000	13.75
6,000	23.98	22,000	12.64
7,000	23.09	24,000	11.60
8,000	22.22	26,000	10.63
9,000	21.39	28,000	9.73
10,000	20.58	30,000	8.89
11,000	19.79	35,000	7.04
12,000	19.03	40,000	5.54
13,000	18.29	50,000	3.42

*Below sea-level. †Ascent

Aneroid barometers are used quite extensively in certain branches of survey work. A justifiable use of the aneroid for this purpose lies in the measurement of heights intermediate between two given contours which have been accurately determined by other methods; e.g., by means of a theodolite.

This requires relative measures of height only, and for such interpolation work the surveying aneroid is usually provided with a uniformly spaced scale of heights in addition to its pressure scale.

BIBLIOGRAPHY.—An article on this subject will be found in the *Dictionary of Applied Physics*, ed. by Sir Richard Glazebrook, vol. iii. (1922–23). Many detailed references are given in this article; also Kaye, *High Vacua*; and Dunoyer, *Vacuum Practice*, translated by Smith.

The following publications should be consulted. They also contain tables of numerical data for the reduction of barometer readings to standard conditions:—*The Observer's Handbook* (ed. by the London Meteorological Office); *Barometers and the Measurement of Atmos-*

pheric Pressure (ed. by the United States Weather Bureau); *The Smithsonian Meteorological Tables*; and *Bul. Sm. Meteorological Soc.* for March, 1923.

BAROMETRIC LIGHT, the luminous glow which appears in the vacuous space above the mercury in a barometer tube when the tube is shaken. It is a special case of the general effect that, if a sealed tube containing mercury and a rarified gas be shaken, flashes of light are produced. With the gas neon bright flashes of red light can be excited by shaking it with mercury, even when the pressure of the gas is atmospheric.

The barometric light was first observed in 1675 by Jean Picard, a scholar of Gassendi's, who noticed flashes of light in the Torricellian vacuum when his barometer was moved about. It was made the subject of many experiments by Francis Hauksbee, who published an account of his work in 1709. He proved that the phenomenon was produced by the motion of mercury in either a glass or a varnished vessel, so that the glass was not a necessary factor, and that a very low pressure of the air was not necessary, as the light was strong when the air in contact with the mercury was at a pressure of an inch or two of mercury. He recognized that the rarefaction of the air was one of the conditions of the phenomenon, and he further stated that the light was electrical in origin, a conclusion suggested by the similarity in appearance of the light to that which he produced in exhausted vessels by the help of his electrical machine. The phenomenon roused much interest among his contemporaries. In 1745 Ludolf the younger clearly demonstrated that the agitation of the mercury produced an electrification of the barometer tube, by showing that the tube attracted, and then repelled, bits of paper in the familiar way. A little later Aepinus and Deluc brought the phenomenon again into notice, and further emphasized its electrical nature.

The barometric light is of interest as the first case of electrical discharge in gases at low pressure observed in the laboratory. The electrification is probably produced partly by the movement of the mercury over the glass surface, partly by the splashing of the mercury. The fact that a newly prepared surface of pure mercury acquires a positive charge in contact with glass has been recently (1920) demonstrated by Perucca, while the electrical effects accompanying splashing of mercury, or the bubbling of gas through mercury, have been investigated by Duhme, following the pioneer work of Lenard. Slight impurities in the mercury have a considerable influence on these effects, and the barometric light, as ordinarily produced, is a complicated phenomenon which has not been analyzed in detail.

For the first detailed experiments, see F. Hauksbee, *Physico-Mechanical Experiments* (1709). For the early investigations see J. Priestley, *History of Electricity* (5th ed., 1794); E. Gerland, *Geschichte der Physik* (1892). For the modern work on the potential differences at mercury surfaces, see A. Coehn, "Kontaktpotential" in *Ergebnisse der exacten Naturwissenschaften* (1922).

(E. N. DA C. A.)

BARON, MICHEL (1653–1729), French actor (whose family name originally was Boyron), was born in Paris. At the age of twelve he joined the company of children known as the *Petits Comédiens Dauphins*. He joined Molière's company, and then became a member of the company at the Hôtel de Bourgogne, and from this time until his retirement in 1691 was undisputed master of the French stage, creating many of the leading rôles in Racine's tragedies, besides those in two of his own comedies, *L'Homme à bonnes fortunes* (1686), and *La Coquette* (1687). In 1720 Baron reappeared at the Palais Royal. He died on Dec. 22 1729.

His son ÉTIENNE MICHEL BARON (1676–1711) was also a fine actor, and left a son and two daughters who all played at the Comédie Française.

See George Monval, *Un Comédien amateur d'art* (1893); also the Abbé d'Allamial's *Lettres à mylord XXX. sur Baron et la demoiselle Lecouvreur*, in F. G. J. S. Andrieux's *Collection des mémoires sur l'art dramatique* (1822).

BARON. This word, of uncertain origin, was introduced into England at the Conquest to denote "the man" (i.e., one who had done him "homage") of a great lord, and more especially of the king. All who held "in chief" (i.e., directly) of the king were alike *barones regis*, bound to perform a stipulated service, and mem-

bers, in theory at least, of his council. Great nobles, whether earls or not, also spoke of their tenants as "barons," where lesser magnates spoke of their "men" (*homines*). This was especially the case in earldoms of a palatine character, such as Chester, where the earl's barons were a well-recognized body, the Venables family, "barons of Kinderton," continuing in existence down to 1679. In the palatinate of Durham also, the bishop had his barons, among whom the Hiltons of Hilton Castle were usually styled "barons of Hilton" till extinct in 1746. Other families to whom the title was accorded, independently of peerage dignity and on somewhat uncertain grounds, were "the barons of Greystock," "the barons of Stafford," and the Cornwalls, "barons of Burford." Fantosme makes Henry II. speak of "mes baruns de Lundres"; John's charter granting permission to elect a mayor speaks of "our barons of our city of London," and a London document even speaks of "the greater barons of the city." The aldermen seem to have been loosely deemed equivalent to barons, and were actually assessed to the poll-tax as such under Richard II. In Ireland the palatine character of the great lordships made the title not uncommon (e.g., the barons of Galtrim, the barons of Slane, the barons of the Naas).

As all those who held direct of the Crown by military service (for those who held "by serjeanty" appear to have been classed apart), from earls downwards, were alike "barons," the great difference in their position and importance must have led, from an early date, to their being roughly divided into "greater" and "lesser" baronies. Within a century of the Conquest, as we learn *Scaccario* already distinguishes their holdings as "greater" or "lesser" baronies. Within a century of the Conquest, as we learn from Becket's case (1164), there arose the practice of sending to the greater barons a special summons to the council, while the lesser barons, it is stipulated in Magna Carta (1215), were to be summoned only through the sheriffs. Thus was introduced a definite distinction, which eventually had the effect of restricting to the greater barons the rights and privileges of peerage.

Thus far the baron's position was connected with the tenure of land; in theory the barons were those who held their lands of the king; in practice, they were those who so held a large amount of land. The great change in their status was effected when their presence in that council of the realm which became the House of Lords was determined by the issue of a writ of summons, dependent not on the tenure of land, but only on the king's will. Camden's statement that this change was made by Henry III. after "the Baron's war" was long and widely accepted, but it is now assigned, as by Stubbs, to Edward I., and the earliest writs accepted as creating hereditary baronies are those issued in his reign. It must not, however, be supposed that those who received such summons were as yet distinguished from commoners by any style or title. The only possible prefix at that time was *Dominus* (lord), which was regularly used by simple knights, and writs of summons were still issued to the lowest order of peers as knights (*chevaliers*) only. The style of baron was first introduced by Richard II. in 1387, when he created John de Beauchamp, by patent, lord de Beauchamp and baron of Kidderminster, to make him "unum parium et baronum regni nostri." But it was not till 1433 that the next "baron" was created, Sir John Cornwall being then made baron of Fanhope. In spite, however, of these innovations, the former was only summoned to parliament by the style of "John Beauchamp of Kidderminster," and the latter by that of "John Cornwall, knight." Such creations became common under Henry VI., a transition period in peerage styles, but "Baron" could not evict "Sire," "Chevalier" and "Dominus." Patents of creation contained the formula "Lord A. (and) baron of B.," but the grantee still styled himself "lord" only, and it is an historically interesting fact that to this day a baron is addressed in correspondence not by that style, but as "the Lord A.," although other peers under the rank of duke are spoken of as "lords," while they are addressed in correspondence by their proper styles. To speak of "Baron A." or "Baron B." is an unhistorical and quite recent practice. When a barony, however, is vested in a lady it is now the recognized custom to speak of her as baroness, e.g., Baroness Berkeley.

The solemn investiture of barons created by patent was performed by the king himself, by enrobing the peer in the scarlet "robe of estate" during the reading of the patent, and this form continued till 13 Jac. I., when the lawyers declared that the delivery of the letters patent without ceremony was sufficient. The letters patent express the limits of inheritance of the barony. The usual limit is to the grantee and heirs male of his body, occasionally, in default of male issue, to a collateral male relative (as in the case of Lord Brougham, 1860) or (as in the case of Lord Basset, 1797, and Lord Burton, 1897) to the heirs-male of a daughter, and occasionally (as in the case of Lord Nelson, 1801) to the heirs-male of a sister. Sometimes also (as in the case of the barony of Rayleigh, 1821) the dignity is bestowed upon a lady with remainder to the heirs-male of her body. The coronation robes of a baron are the same as those of an earl, except that he has only two rows of spots on each shoulder; and, in like manner, his parliamentary robes have but two guards of white fur, with rows of gold lace; but in other respects they are the same as those of other peers. King Charles II. granted to the barons a coronet, having six large pearls set at equal distances on the chapel. A baron's cap is the same as a viscount's. His style is "Right Honourable"; and he is addressed by the king or queen, "Right Trusty and Well-beloved." His children are by courtesy entitled to the prefix "The Honourable."

Barons of the Exchequer were formerly six judges (a chief baron and five puisne barons) to whom the administration of justice was committed in causes betwixt the king and his subjects relative to matters of revenue. Selden, in his *Titles of Honour*, conjectures that they were originally chosen from among the barons of the kingdom, and hence their name; but it would probably be more exact to say that they were officers of a branch of the king's *Curia*, which was theoretically composed of his "barons." The title has become obsolete since 1875, when the court of exchequer was merged in the High Court of Judicature.

Barons of the Cinque Ports (originally Hastings, Dover, Hythe, Romney and Sandwich) were at first the whole body of their freemen, who were so spoken of in royal charters. But the style was afterwards restricted to their mayors, jurats, and (prior to 1831) members of the House of Commons elected by the Cinque Ports, two for each port. Their right to the title is recognized in many old statutes, but in 1606 the use of the term in a message from the Lower House drew forth a protest from the peers, that "they would never acknowledge any man that sitteth in the lower house to the right or title of a baron of parliament" (*Lords' Journals*). It was the ancient privilege of these "barons" to bear a canopy over the sovereign at his or her coronation and retain it as their perquisite. They petitioned as "barons of the Cinque Ports" to attend the coronation of George V., and a deputation was allowed to do so.

Baron and Feme, in English law, is a phrase used for husband and wife, in relation to each other, who are accounted as one person. Hence, by the old law of evidence, the one party was excluded from giving evidence for or against the other in civil questions, and a relic of this is still preserved in the criminal law. The foreign title of baron is occasionally borne by English subjects, but confers no precedence in the United Kingdom.

The Foreign Title.—On the continent of Europe the title baron, though the same in its origin, has come to imply a rank and status very different from its connotation in the United Kingdom, and again varies considerably in different countries. Originally *baro* meant no more than "man," and is so used in the Salic and other "barbarian" laws. In this way, too, it was long preserved in the sense of "husband." Gradually the word seems to have come to mean a "strong or powerful man," and thus "a magnate." Finally, in France in the 12th century the general expression *barones* was introduced in a restricted sense, as applied properly to all lords possessing an important fief, subject to the rule of primogeniture and thus not liable to be divided up and held of one overlord alone. Sometimes it included ecclesiastical lordships of the first rank. In the 13th century the Register of King Philip Augustus places the *barones regis Francie* next to the dukes and counts holding in chief, the title being limited to

vassals of the second rank. Towards the end of the century the title had come to mean that its bearer held his principal fief direct from the crown, and was therefore more important than that of count, since many counts were only mediate vassals. Thus the kings in granting a duchy or countship as an apanage to their brothers or sons used the phrase *in comitatum et baroniam*. From this period, however, the title tends to sink in importance. When, in the 14th century, the feudal hierarchy was completed and stereotyped, the barons are ranked not only below counts, but below viscounts, though in power and possessions many barons were superior to many counts. In any case, until the 17th century, the title of baron could only be borne by the holder of a territorial barony; and it was Louis XIV. who first cheapened the title in France by creating numerous barons by royal letters. This dissociation of the title from the idea of feudal rights and obligations was completed by Napoleon's decree of March 1, 1808, reviving the ancient titles. By this instrument the title of baron was to be borne *ex officio* by a number of high officials, *e.g.*, ministers, senators, councillors of state, archbishops and bishops. It was given to the 37 mayors who attended the coronation, and could be claimed by any mayor who had served to the emperor's satisfaction for ten years, and by any member of an electoral college who had attended three sessions. The title was made to descend in order of primogeniture to legitimate or adopted sons and to the nephews of bishops, the sole condition being that proof must be presented of an actual income of 15,000 fr., of which one-third should descend with the title. The creation of barons was continued by Louis XVIII., Charles X. and Louis Philippe, and, suspended at the revolution of 1848, was revived again on a generous scale by Napoleon III. The tolerant attitude of the Third Republic towards titles, which it does not officially recognize, has increased the confusion by facilitating the assumption of the title on very slender grounds of right. The result has been that in France the title of baron, unless borne by the recognized representative of a historic name, not only involves no political status, but confers also but very slight social distinction.

The same is true, *mutatis mutandis*, of most other European countries, and notably of Italy. In Austria and Germany the case is somewhat different. Though in Latin documents of the middle ages the term *barones* for *liberi domini* was used, it was not until the 17th century that the word *Baron*, perhaps under the influence of the court of Versailles, began to be used as the equivalent of the old German *Freiherr*, or free lord of the empire. The style *Freiherr* (*liber dominus*) implied originally a dynastic status, and many *Freiherren* held countships without taking the title of count. When the more important of them styled themselves counts, the *Freiherren* sank into an inferior class of nobility. The practice of conferring the title *Freiherr* by imperial letters was begun in the 16th century by Charles V., was assumed on the ground of special imperial concessions by many of the princes of the empire, and later exercised by all the German sovereigns. Though the practice of all the children taking the title of their father has tended to make that of baron comparatively very common, and has dissociated from it all idea of territorial possession, it still implies considerable social status and privilege in countries where a sharp line is drawn between the caste of "nobles" and the common herd, whom no wealth or intellectual eminence can place on the same social level with the poorest *Adeliger*. In Japan the title baron (*Dan*) is the lowest of the five titles of nobility introduced in 1885, on the European model. It was given to the least important class of territorial nobles, but is also bestowed as a title of honour without reference to territorial possession.

See John Selden, *Titles of Honor*, p. 353 (ed. 1672); du Cange, *Glossarium*, s. "Baro" (ed. Niort, 1883); Achille Luchaire, *Manuel des institutions françaises* (1892); Maurice Prou, art. "Baron" in *La Grande Encyclopédie*. (W. A. P.)

BARONET. Although the origin of this title has been the subject of speculation, it is not known why it was selected as that of "a new Dignitie between Barons and Knights" created by James I. The object of its institution was to raise money for the crown, as was also done by the sale of peerage dignities under this

sovereign. But the money was professedly devoted to the support of troops in Ulster, that is, each grantee was to be liable for the pay of 30 men, at 8d. a day for three years. This amounted to £1,095, the sum paid for the honour. When it was instituted, in May 1611, the king covenanted that he would not create more than 200, and that only those who had £1,000 a year in landed estate and whose paternal grandfathers had borne arms should receive the honour. But these qualifications were soon abandoned. As an inducement to apply for it, it was made to confer the prefix of "Sir" and "Lady" (or "Dame"), and was assigned precedence above knights, though below the younger sons of barons. Eight years later (Sept. 30, 1619) the baronetage of Ireland was instituted, the king pledging himself not to create more than 100 baronets. Meanwhile, questions had arisen as to the precedence of the baronets, and James, by decree (May 28, 1612), had announced that it was his intention to rank them below the younger sons of barons. As this had the effect of stopping applications for the honour, James issued a fresh commission (Nov. 18, 1614) to encourage them, and finally, as "the King's wants might be much relieved out of the vanities and ambition of the gentry" (in Chamberlain's words), he granted, in 1616, the further privilege that the heirs apparent of baronets should be knighted on coming of age.

The baronetage of Nova Scotia was devised in 1624 for promoting the "plantation" of that province, and James announced his intention of creating 100 baronets, each to support six colonists for two years (or pay 2,000 marks in lieu thereof), and also to pay 1,000 marks to Sir William Alexander (afterwards earl of Stirling), to whom the province had been granted in 1621. For this he was to receive a "free barony" of 16,000 acres in Nova Scotia, and to become a baronet of "his Hienes Kingdom of Scotland." Charles I. carried out the scheme, creating the first Scottish baronet on May 28, 1625, covenanting that the baronets "of Scotland or of Nova Scotia" should never exceed 150, that their heirs apparent should be knighted on coming of age, and that no one should receive the honour who had not fulfilled the conditions, *viz.*, paid 3,000 marks (£166 13s. 4d.) towards the plantation of the colony. Four years later (Nov. 17, 1629) the king wrote to "the contractors for baronets," recognizing that they had advanced large sums to Sir William Alexander for the plantation on the security of the payments to be made by future baronets, and empowering them to offer a further inducement to applicants; and on the same day he granted to all Nova Scotia baronets the right to wear about their necks, suspended by an orange tawny ribbon, a badge bearing an azure saltire with a crowned inescutcheon of the arms of Scotland and the motto "Fax mentis honestae gloria." As the required number, however, could not be completed, Charles announced in 1633 that English and Irish gentlemen might receive the honour, and in 1634 they began to do so. Yet even so, he was only able to create a few more than 120 in all. In 1638 the creation ceased to carry with it the grant of lands in Nova Scotia, and on the union with England (1707) the Scottish creations ceased, English and Scotsmen alike receiving thenceforth baronetcies of Great Britain.

The history of the baronetage was uneventful till 1783, when in consequence of the wrongful assumption of baronetcies, an old and then increasing evil, a royal warrant (Dec. 6) directed that no one should be recognized as a baronet in official documents till he had proved his right, and also that those created in future must register their arms and pedigree at the Heralds' college. In consequence of the opposition of the baronets themselves, the first of these two regulations was rescinded and the evil remained unabated. Since the union with Ireland (1800) baronets have been created, not as of Great Britain or of Ireland, but as of the United Kingdom.

In 1834 a movement was initiated by Mr. Richard Broun (whose father had assumed a Nova Scotia baronetcy some years before), to obtain certain privileges for the order, but on the advice of the Heralds' college, the request was refused. A further petition, for permission to all baronets to wear a badge, as did those of Nova Scotia, met with the same fate in 1836. Meanwhile George IV. had revoked (Dec. 19, 1827), as to all future

creations the right of baronets' eldest sons to claim knighthood. Mr. Broun claimed it as an heir apparent in 1836, and on finally meeting with refusal, publicly assumed the honour in 1842, a foolish and futile act. In 1854 Sir J. Kingston James was knighted as a baronet's son, and Sir Ludlow Cotter similarly in 1874, on his coming of age; but when Sir Claude de Crespigny's son applied for the honour (May 17, 1895), his application was refused, on the ground that the lord chancellor did not consider the clause in the patent (1805) valid. The reason for this decision appears to be unknown.

A fresh agitation was aroused in 1897 by an order giving the sons of life peers precedence over baronets, some of whom formed themselves, in 1898, into "the Honourable Society of the Baronetage" for the maintenance of its privileges. But a royal warrant was issued on Aug. 15, 1898, confirming the precedence complained of. The above body, however, continued in existence as the "Standing Council of the Baronetage," and succeeded in obtaining invitations for some representatives of the order to the coronation of King Edward VII. It has been sought to obtain badges or other distinctions for baronets and also to purge the order of wrongful assumptions, an evil to which the baronetage of Nova Scotia is peculiarly exposed, owing to the dignity being descendible to collateral heirs male of the grantee as well as to those of his body. A departmental committee at the Home Office was appointed in 1906 to consider the question of such assumptions and the best means of stopping them. Following this, an official roll of the baronetage was established by royal warrant of Feb. 11, 1910, a roll which was first gazetted on Feb. 23, 1914. Every person succeeding to a baronetcy must now exhibit to the Home Secretary his proofs of succession.

All baronets are entitled to display in their coat of arms, either on a canton or on an inescutcheon, the red hand of Ulster, save those of Nova Scotia, who display, instead of it, the saltire of that province. The precedence of baronets of Nova Scotia and of Ireland in relation to those of England was left undetermined by the Acts of Union, and appears to be still a moot point with heralds. The premier baronet of England is Sir Hickman Bacon, whose ancestor was the first to receive the honour in 1611.

BARONIUS, CAESAR (1538-1607), ecclesiastical historian, was born at Sora and educated at Veroli and Naples. At Rome he joined the Oratory in 1557 under St. Philip Neri (*q.v.*) and succeeded him as superior in 1593. Clement VIII., whose confessor he was, made him cardinal in 1596 and librarian of the Vatican. At two conclaves he was nearly elected pope, but at both was opposed by Spain on account of his work *On the Monarchy of Sicily*, in which he supported the papal claims against the Spanish. His *Annales Ecclesiastici* were undertaken in reply to the *Magdeburg Centuries*; after nearly 30 years of lecturing on the history of the Church at the Vallicella and being trained by St. Philip as a great man for a great work, he began to write, and produced the 12 folios (1588-1607) of the *Annales*. In spite of errors, especially in Greek history, in which he had to depend upon secondhand information, the work of Baronius is an honest attempt to write history. Sarpi, in urging Casaubon to write against Baronius, warns him never to suspect Baronius of bad faith, for no one who knew him could accuse him of disloyalty to truth. Baronius makes his own the words of St. Augustine: "I shall love with a special love the man who most rigidly and severely corrects my errors." He also undertook a new edition to the Roman martyrology (1586), which he purified of many inaccuracies.

His *Annales*, which end in 1198, were continued by Rinaldi (9 vols., 1676-77); by Laderchi (3 vols., 1728-37); and by Theiner (3 vols., 1856). The most useful edition is that of Mansi (38 vols., Lucca, 1738-59), giving Pagi's corrections at the foot of each page.

BARONS WAR, the name given in English history to the civil war of 1263-1267. In 1261 Henry III. had been absolved by the pope from his oath to the Provisions of Oxford (1258),

which King Louis of France by the Mise of Amiens (Jan. 23, 1264), further declared to be invalid. Led by Simon de Montfort, a section of the barons took up arms. Famous in the course of the war are the battles of Lewes (1264), where de Montfort defeated the king, and Evesham (1265), where the de Montfort party was routed and Simon himself slain; but the most important event of these years was de Montfort's parliamentary experiments of 1265. A settlement was finally reached by the Dictum of Kenilworth (1266) and the Statute of Marlborough (1267). (See ENGLISH HISTORY; MONTFORT, SIMON DE; OXFORD, PROVISIONS OF.)

BARONY, the domain of a baron (*q.v.*). In Ireland counties are divided into "baronies," which are equivalent to the "hundreds" (*q.v.*) in England, and seem to have been formed out of the territories of the Irish chiefs, as each submitted to English rule (General Report of the Census of England, iv. 181, 1873). In Scotland the term is applied to any large freehold estate even when held by a commoner. Barony also denotes the rank or dignity of a baron, and the feudal tenure "by barony."

BAROQUE, a term used to describe the tendencies prevailing in European art during part of the 16th, the 17th and the first half of the 18th centuries. It is of uncertain derivation, one explanation being that it springs from the Spanish word *barrueco*, a large irregularly-shaped pearl. The word denotes the greater freedom and irregularity which succeed, in European art, the equipoise and restraint of the Renaissance. At first marked by stateliness and amplitude of form, the Baroque style in the 18th century becomes more playful and piquant in character, this variety of it being known as the style of the Rococo (*q.v.*). Typical Baroque artists are: in architecture, Lorenzo Bernini (1598-1680) and Francesco Borromini (1599-1667); in sculpture, Lorenzo Bernini; and in painting, Pietro Berrettini da Cortona (1596-1669) and Peter Paul Rubens (1577-1640).

BAROQUE ARCHITECTURE. So many different factors both of technique and thought went to the making of Baroque art that, not so many years ago, when comparing it with the art of other periods, critics condemned it as false, over-emphasized and seeking only to astonish. "Its architecture," they asserted, "was debased and deformed; its painting, turbid and heavy; its sculpture, empty and confused." It was inevitable that the period of reaction having run its course, history and criticism should rectify the earlier conceptions, although not without a half century of conflict.

Baroque architecture was built up naturally on the basis of the final period of the Renaissance (see RENAISSANCE ARCHITECTURE). It arose in a world which had given itself over to an extreme self-indulgence, matching the extremes of religious asceticism indulged in by the clergy. There was, generally, a simultaneous increase in knowledge and in superstition, in benevolence and in crime, in splendour and in misery. In this worldly atmosphere art managed to extricate itself from a dominating concourse of aesthetic, religious and social elements. Under such conditions it could not have developed otherwise than it did.

Characteristics.—Rome was the birthplace of Baroque art and there it developed in its own surroundings, in clear consciousness of its aims, with the support of a strong tradition. It repeated the very beginnings of the architecture of imperial Rome, just as Rome adorned herself with Byzantine, Romanesque and Renaissance buildings, because all their forms were akin to or derived from the Roman. The vaults, the cupolas, the arches, had their origin in the imperial art, even if enriched by the Byzantine, toned down by the Romanesque, softened by the Renaissance, amplified by the Baroque, subtilized by the neo-classical. On the other hand, Baroque architecture rejected resolutely the Gothic style, slender, mystical, dreamy, which substituted the tenuous aspiration of ascending lines for the practical solidity of horizontal planes and bindings. The altars, tombs, confessionals and pyxes, organs and choirs, altar-pieces and reliquaries, the palaces with their

EXAMPLES OF THE BAROQUE STYLE IN EUROPE

1. Paris, church of the Invalides, designed by Mansart, 1706, to complete the Hôtel des Invalides. The church, which contains the tomb of Napoleon I, is a square building symmetrically designed, surmounted by a dome raised on two high drums, and crowned by a light, spire-like lantern rising to a height of 350 feet
2. Bernini colonnades, St. Peter's, Rome. One of the two curving colonnades, built between 1655 and 1667, which adjoin St. Peter's Church and partly enclose the piazza before it. They are open on all sides, and are composed of four rows of columns of the Tuscan order
3. Venice, Church of Santa Maria della Salute, designed by Longhena and erected 1631-1682 by the state to commemorate the end of the great plague of 1630. The building is octagonal, with a central dome supported by great scrolls carrying statues, and a second dome above the choir
4. Dresden, wall-pavilion at a corner of the great court of the Zwinger Palace, built 1709-1718, M. Poppelmann, architect. The design is marked by large window-spaces divided by slender piers with elaborate detail above
5. Rome, the Trevi Fountain, 18th century, probably from Bernini's design. It illustrates the perfection of proportion and unity of composition distinguishing the work of baroque architects, but with more elaboration of detail than earlier Italian examples
6. Rome, church of San Carlo alle Quattro Fontane, built 1640-46, designed by Borromini, who, with Bernini, brought the baroque style to its height in Italy
7. Rome, Barberini Palace, said to be the combined work of Bernini, Borromini and Maderna. The design recalls the earlier Renaissance style in its severe regularity. The false perspective in the windows of the third storey is a detail characteristic of the baroque
8. Seville, church of San Jacinto, a Spanish version of the baroque form, less grandiose than the examples from other countries, but showing a similar trend

beds, mirrors, tables, divans and chairs—all had the same richness, the same importance. In the churches the splendour of the pictures was equalled by the polychromatic richness of the marble; in the palaces, the wealth of the brocades and tapestries, and everywhere the splendour of the metals. In the churches the cupola took a predominant place because it lent itself better than slender bell-towers to grandiose lines. For the most part the interiors consisted of spacious naves flanked by chapels or else by two narrow aisles, supported by pillars. In palaces importance was attached to the principal doorway, entrance and stairway, which in the Renaissance were relatively modest. Finally the Baroque architects passed on from the palaces and churches to the vast conception of entire open squares and the perspective of streets, with stairways, colonnades and fountains.

Bernini and Borromino.—The number of Italian architects during the Baroque period was very large and hailed from every province, more especially from Upper Italy. Without naming all of note it may be mentioned that the Baroque style culminated in two great artists, Bernini (1598–1680) and Francesco Borromino (1599–1667).

Development.—From Rome Baroque architecture spread over all Italy and into other European countries. Italian architects, generally speaking, belonged to the school of the innovating genius of Borromino rather than to the weighty and traditional school of Bernini. They were to be found then in Spain, France, the Netherlands, Germany, and above all, in Poland and Russia. But soon in these and other lands local architects came to the front who contrived to impart a special character of their own to Baroque—a character suited to the region, the climate, the building methods and material, and above all the tastes and temperament of the country. The fiery temperament of the Spaniards carried Baroque to an extreme, first with the work of the brothers Mora and Alonso Cano, then by the revival and aggravation of the stuccoesque style of José Churriguera (1650–1725) who created an architectural style which was bound to arrest attention by its fantasy and its undeniable beauties but which was so full of eccentricities, so overdone with ornamentations, so broken up and swamped by fantastic decoration, that the word *Churrigueresque* had to be coined to describe such an orgy of capricious ornamentation. France, which had become the preponderant power in Europe in the 17th century, not merely disregarded the Spanish movement but freed herself gradually from the influence of Italy, forming a style which was to win throughout the continent as many followers as the Italian Baroque, partly because it showed more regard for the practical necessities of life and paid more attention to the arrangement and adornment of the interiors. The periods of the Baroque were classified in France by a kind of court chronology; the Louis XIII. period, 1623–43, early Baroque; Louis XIV., 1643–1715, full Baroque, Regency, 1715–23, development into Rococo. The creations of French Baroque were countless—churches, palaces, castles and ornamental parks. Two great nuclei of buildings remain as outstanding examples of its quality, the Louvre and Versailles, upon which the greatest architects of the time were engaged: Lemercier (1590–1654), Nicolas François Mansart (1598–1666) (who gave the name of *mansardes* to the sloping roofs with upright windows used by him to interrupt the lines of his buildings and to make the top storeys more habitable), Louis Leveau (1612–70), Claude Perrault (1613–88), Jules Hardouin Mansart (1646–1708) etc. In the Netherlands among the patrons of Baroque were Peter Paul Rubens, his friend Jacques Francquart (1577–1651), and his disciple, Faidherbe (1617–97). They developed a Baroque which showed signs of various influences, Italian and French as well as Spanish and German. At first fussy and “chopped up,” it acquired repose when the forms of Palladio prevailed. While these declined and grew cold with Virigboon, in England they acquired vitality with Vanbrugh (1666–1726) who had been inspired by the sight of Versailles. Gradually in this period (1702–14) the simplicity of the so-called Queen Anne style, especially in private architecture, came into vogue—which was to be revived with a touch of genius in the nineteenth century. Great pomp and vigour were attained by Baroque in Germany where not only

was a court-like character imparted to separate buildings but to districts and to entire towns, such as Karlsruhe, Mannheim, Saarbrücken, Ellangen, Potsdam, while a distinctive aspect was given also to old cities like Vienna, Dresden, Bayreuth, Würzburg, etc. In the Catholic south, especially Austria and Bavaria, Baroque took a warm grandiose form, full of movement in the Roman manner. Architects who became prominent were Fischer von Erlach, Hildebrandt, Prandauer, Neumann, Poppelmann and Andrea Schlüter. Baroque art existed for two centuries and then faded away naturally like all the literary, philosophical and religious forms and habits which had combined to create and support it.

BAROSS, GABOR (1848–1892), Hungarian statesman, was born at Trencsén on July 6, 1848, and educated at Esztergom. He entered parliament in 1875, and attached himself to Kalmán Tisza. In 1883 he was appointed secretary to the ministry of ways and communications, and in 1886 he was appointed minister of ways and communications. The gigantic network of the Austro-Hungarian railway system and its unification was mainly his work. He regulated the Danube at the hitherto impassable Iron Gates Rapids by building canals to open up the eastern trade to Hungary. The amalgamation of the ministry of commerce with the ministry of ways in 1889 further enabled Baross to revise the tolls. This nationalist policy provoked protests both from Austria and

Germany at the Conference of Vienna in 1890, and Baross was obliged somewhat to modify his system. He died on May 8, 1892.

See László Petrovics, *Biography of Gabriel Baross* (Hung. Eperies, 1892).

BAROTAC NUEVO, a municipality (with administration centre and 20 barrios or districts) of the province of Iloilo, Panay, Philippine Islands, near the Jalaur river, above its mouth on the south-east coast, and about 15m. N.E. of Iloilo, the capital. Pop. (1918), 13,299, of whom 6,590 were males and three whites. The town lies in a fertile district and deals in rice, sugar, trepang and piña. In 1918, it had 18 sugar mills, with output valued at 100,400 pesos, besides 325 household industry establishments with output valued at 55,300 pesos. Of its nine schools, six were public. The language is Panay-Bisayan.

BAROTSE, BAROTSELAND, a people and country of South Central Africa. The greater part of the country is a British protectorate, forming part of northern Rhodesia. The Barotse are the paramount tribe in the region of the Upper Zambezi basin, but by popular usage the name is also applied to contiguous subject tribes, Barotseland being the country over which the Barotse paramount chief exercises authority. The present article treats of the people and of modern political developments.

The Barotse.—These people, originally known as Aalui, have occupied the extensive plain through which the Zambesi passes from 14° 35' S. to 16° 25' S. throughout the reigns of twenty-two successive paramount chiefs and therefore approximately since the commencement of the 17th century. Previously, for an indefinite period, they dwelt on the Kabompo river, 200 m. to the N.E. of their present country, and here the descendants of a section of the tribe which did not migrate still remain, under the name Balokwakwa (men of the ambushade), formerly known as Aalukolui. The Makololo gave the Barotse their present name, an error for Marotse.

The Barotse proper are comparatively few in number; they are very black, tall in stature, deep in chest and comparatively speaking refined in feature. Being numerically small they form an oligarchy in which, with few exceptions, each man holds rank in a chieftainship of which there are three grades. As a reward of gallantry or ability the paramount chief occasionally conferred chief's rank on individuals not of Barotse birth, and these *ipso facto* assumed the name and privileges of the Barotse. In 1906 the paramount chief, by proclamation, abolished the state of slavery, an act which, however, left untouched the predominant position of the Barotse and their rights to chieftainship. The paramount chief shares with a queen (*Mokwai*) his authority and prerogatives. The Mokwai is not the wife but the eldest sister of the ruling chief. With his death her privileges lapse. Theoretically, these co-rulers are equal, neither may promulgate a national decree without the assent of the other, but each has a capital town, councillors and absolute authority in a province, the two having joint authority over all other provinces. The Barotse imagine the sun to be the embodiment of a great god whose sole care is for the amelioration of man. Him they worship, though more pains are taken to appease evil spirits. The spirits of ancestors—especially of deceased chiefs—are also objects of worship. Christianity of a Protestant Evangelical type was first introduced into the country in 1884 by François Coillard. See RHODESIA, SOUTHERN and NORTHERN.

The Establishment of British Suzerainty.—By the charter granted to the British South Africa Company in Oct. 1889, the company was allowed to establish its rule in the regions north of the Middle Zambezi not included in the Portuguese dominions, and by a treaty of June 11, 1891, between Great Britain and Portugal it was declared that the Barotse kingdom was within the British sphere of influence. The dispute between the contracting powers as to what were the western limits of Barotseland was eventually referred to the arbitration of the king of Italy, who by his award of May 30, 1905, fixed the frontier at the Kwando river as far north as 22° E., then that meridian up to 13° S., which parallel it follows as far east as 24° E., and then that meridian to the Belgian Congo frontier. In the meantime the

British South Africa Company had entered into friendly relations with Lewanika, the paramount chief of the Barotse, and an administrator was appointed on behalf of the company to reside in the country. A native police force under the command of a British officer was raised and magistrates and district commissioners were appointed. In the internal affairs of the Barotse the company did not interfere, and the relations between the British and Barotse have been uniformly friendly. The pioneers of Western civilization were not, however, the agents of the Chartered Company, but missionaries. F. S. Arnot, an Englishman, spent two years in the country (1882–84) and in 1884 a mission, fruitful of good results, was established by the Société des Missions Évangéliques de Paris. Its first agent was François Coillard (1834–1904), who had previously been engaged in mission work in Basutoland and devoted the rest of his life to the Barotse. From the moment Great Britain assumed responsibility and the advance of European civilization became inevitable, all the influence acquired by Coillard's exceptional personal magnetism and singleness of purpose was used to prepare the way for the extension of British rule. Direct imperial control was substituted for that of the Company in 1924. (See RHODESIA.)

BARQUISIMETO, a city of western Venezuela, capital of the State of Lara, on the Barquisimeto river, 101m. by rail S.W. of Tucacas, its port on the Caribbean coast. Pop. (estimated 1920) 23,943. It is built in a small, fertile valley of the Merida Cordilleras, 1,985ft. above sea-level, has a temperate, healthy climate with a mean annual temperature of 78°, and is surrounded by a highly productive country from which are exported coffee, sugar, cacao and rum. Barquisimeto was founded in 1552 by Juan de Villegas, who was exploring the neighbourhood for gold, and it was first called Nueva Segovia after his native city. On March 26, 1812, it was totally destroyed by an earthquake, and with it 1,500 lives, including a part of the revolutionary forces occupying the town.

BARR, AMELIA EDITH (HUDDLESTON) (1831–1919), Anglo-American novelist, was born in Ulverston, England, on March 29, 1831. In 1850 she married Robert Barr and four years later went with him to the United States, where they settled in Austin, Tex., removing in 1867 to Galveston. There her husband and three sons died of yellow fever. Three daughters remained to her, and in 1869 she took them to New York city where she was a teacher for two years and then wrote for magazines and newspapers. Her first novel, *Romance and Reality* (1872), was followed by more than 60 others, the best known of which is *Jan Vedder's Wife* (1885). Her work is characterized by historical settings, generally English, Scotch or colonial American.

See *All the Days of My Life* (1913), an autobiography.

BARRA or BARRAY (Scand. *Baraey*, isle of the ocean), island, outer Hebrides, Inverness-shire, Scotland. Pop. (1921), 2,311. It lies about 5m. S.W. of South Uist and is 8m. long and from 2 to 4m. wide, save at the sandy isthmus 2m. below Scurrial Point, where it is only a few hundred yards broad. The rock formation is gneiss. The highest hill is Heaval (1,260ft.) and there are several small lochs. The chief village is Castlebay, with the castle of Kisamul on a rock in the bay, once the stronghold of the M'Neills of Barra, one of the oldest Highland clans. There are remains of ancient chapels, Norse duns and stone circles on the island. The parish comprises a number of smaller islands and islets and contains 4,000ac. of arable land and 18,000ac. of meadow and hill pasture. Herring and other fisheries are important, and the coasts abound with cockles. On Barra Head, the highest point of Berneray, and also the most southerly point

of the outer Hebrides chain, is a lighthouse 58ft. above high water.

BARRACKPORE, a town and subdivisional headquarters of British India, in the district of Twenty-four Parganas, Bengal. The town, situated on the left bank of the Hooghly, is divided between two municipalities, North Barrackpore, with a population (1921) of 15,433, and South Barrackpore (pop. 22,460). It contains a cantonment and its name is said to be derived from the fact of troops having been stationed here since 1772. To the south of the cantonment is situated the park, within which is Government House, a noble building, which was the country house of the governors-general and viceroys from the beginning of the 19th century till 1912. Since the latter year it has been a suburban residence of the governors of Bengal.

BARRACKS, the buildings used for the accommodation of military or naval forces, including the quarters for officers, warrant officers, non-commissioned officers and men, with their messes and recreation establishments, regimental offices, shops, stores, stables, vehicle sheds and other accessory buildings for military or domestic purposes. The term is usually applied to permanent structures of brick or stone used for the peace occupation of troops; but many hut barracks of corrugated iron lined with wood have been built, generally in connection with a training ground for troops, and in these the accommodation given is somewhat less than in permanent barracks, and conditions more nearly approach those of a military encampment.

Barrack Construction History.—As long as operations in the field were carried on by troops levied especially for the war in hand, no barracks apart from fortifications were required, except those for the royal bodyguard; and even after the standing army exceeded those limits, the necessity for additional barracks was often avoided by having recourse to the device of billeting, *i.e.*, quartering the soldiers on the populations of the towns where they were posted. This, however, was a device burdensome to the people, subversive of discipline, and prejudicial to military efficiency in many ways, while it exposed the scattered soldiers to many temptations to disloyalty. Hence barracks were gradually provided, at first in places where such an arrangement was most necessary owing to the paucity of the population, or where concentration of troops was most important, owing to the disaffection of some of the inhabitants. The earliest barracks of which there is any record as regards England, were those for the foot guards, erected in 1660. Among the earliest of those still existing are the Royal Barracks at Dublin, dating from 1700, and during the 18th century barracks were built in several parts of Ireland; but in England it was at the end of the 18th and beginning of the 19th century that most of the earlier barracks were constructed. So long as barracks were mainly in connection with fortresses their construction naturally fell to the duty of the King's Engineers, afterwards the Corps of Engineers, working under the master-general of the ordnance. About 1796, however, a special civil department was formed to deal with barracks apart from fortifications. In 1816 we find a warrant appointing a civilian comptroller of the barrack department to deal with the erection and upkeep of barracks and barrack hospitals not within fortified places. This warrant gives one of the earliest records of the nature of accommodation provided, and a few extracts from it are worth notice. No definite regulations as to cubic or floor space per man are laid down; but in the infantry, twelve men, and in the cavalry, eight men are allotted to one room. "Bedsteads or berths" are allowed, "a single one to each man, or a double one to two men," or "hammocks where necessary." The married soldier's wife is barely recognized, as shown by the following extract:—"The comptroller of the barrack department may, if he sees fit, and when it in no shape interferes with or straitens the accommodation of the men, permit (as an occasional indulgence, and as tending to promote cleanliness, and the convenience of the soldier) four married women per troop or company of sixty men, and six per troop or company of a hundred men, to be resident within the barracks; but no one article shall on this account be furnished by the barrack-masters, upon any consideration whatever. And if the barrack-master perceive that

any mischief, or damage, arises from such indulgence, the commanding officer shall, on their representation, displace such women. Nor shall any dogs be suffered to be kept in the rooms of any barrack or hospital." Another regulation says: "Where kitchens are provided for the soldiers, they shall not be allowed to dress their provisions in any other places." In about 1818 the civil barrack department was abolished on account of abuses which had grown up, and the duke of Wellington as master-general of the ordnance and commander-in-chief transferred to the Corps of Royal Engineers the duties of construction and maintenance of barracks. In 1826 a course of practical architecture was started at the school of military engineering at Chatham under Lieut.-Col. (afterwards Sir Charles) Pasley, the first commandant of the school, who himself wrote an outline of the course. Wellington interested himself in the barrack question, and under his orders single iron bedsteads were substituted for the wooden berths, two tiers high, in which two men slept in the same bed, then a certain cubical space per man was allotted, and cook-houses and ablution rooms were added. Next, sergeants' messes were started, and ball courts allowed for the recreation of the men. It was not, however, till after the Crimean War that public attention was directed by the report, dated 1857, of the royal commission on the sanitary state of the army, to the high death-rate, and certain sanitary defects in barracks and hospitals, such as overcrowding, defective ventilation, bad drainage and insufficient means of cooking and cleanliness, to which this excessive mortality was among other causes assigned.

In 1857 a commission appointed for improving the sanitary condition of barracks and hospitals made an exhaustive inspection of the barracks in the United Kingdom, and reported in 1861. This was followed by similar commissions to examine the barracks in the Mediterranean stations and in India. These commissions, besides making valuable recommendations for the improvement of almost every barrack inspected by them, laid down the general sanitary principles applicable to the arrangement and construction of military barracks and hospitals; and established a definite standard of accommodation with 600 cu ft per man as the minimum scale. To give every soldier his allotted amount of 600 cu ft, meant a reduction in accommodation of the barracks by nearly one-third the number. Many buildings were condemned as being entirely unsuitable for use as barracks; in other cases improvements were possible by alterations to buildings and opening-up of sites. Separate quarters for the married soldiers did not exist in many barracks, and in some instances married men's beds were found in the men's barrack rooms without even a screen to separate them; in other cases, married people were accommodated together in a barrack-room, with only a blanket hung on a cord as a screen between the different families. The recommendations of the committee resulted in a single room being allotted to all married soldiers, and this accommodation has gradually improved up to the comfortable cottage now provided.

Steady and systematic progress has been made in barrack accommodation. In 1857, the annual rate of mortality in the army at home per 1,000 men was 17.5 (compared with 9.2 for the civil male population of corresponding age), forty years later, in 1897, the rate of mortality in the army was only 3.42 per 1,000. Improved barrack accommodation undoubtedly contributed to this result. Barrack construction work remained in the hands of the Corps of Royal Engineers until 1904, when a civil department was again formed, under an architect styled "director of barrack construction," to deal with the construction of barracks at home stations, and the construction and maintenance of military hospitals. In 1918, however, this department was abolished and the control of barrack construction reverted to the Royal Engineers.

British System.—The accommodation to be given in British military barracks is scheduled in the Barrack Synopsis. Each item of ordinary accommodation is described in the synopsis, and the areas and cubic contents of rooms therein laid down form the basis of the designs for any new buildings. Supplementary to the synopsis is a series of "Standard Plans," which illustrate how accommodation may be arranged. The selection of a healthy site for a barrack building or new military station is of great

importance. In earlier days of barrack construction, barracks were, for political reasons, usually built in large towns, where troops would be at hand for putting down disturbances. Cramped and inconvenient buildings of many storeys, were erected on a small piece of ground often surrounded by the worst slums of the city. In the present day, except in a few cases where strong local influence is allowed to prevail to retain troops in towns, where their

FIG 1 GROUND FLOOR PLAN OF A MODERN TWO-STOREY BARRACK BUILDING THE PLAN OF THE FLOOR ABOVE IS SIMILAR

presence is appreciated for patriotic or other motives, every opportunity is taken to move troops from the vicinity of crowded towns, and quarter them in barracks or hutments built in the open country. Due regard can then be given to sanitary location, and military training can more effectively be carried out.

Modern British Barracks.—A description of a modern barrack for a battalion of infantry will give an idea of the standard of accommodation which is now authorized, and to which older barracks are gradually being remodelled as funds permit. The unmarried soldiers are quartered in barrack rooms usually planned to contain fifteen men in each; this number forms a convenient division to suit the organization of the company, and is more popular with the men than the larger numbers, which were formerly the rule. The rooms give 600 cu ft. of air per man and have windows on each side: the beds are spaced 6 ft. apart from centre to centre, and are arranged so that there are not more than two between any two windows: over each man's bed is a locker in which he keeps his kit, and his rifle stands near the head of his bed. Convenient of access from the door to the barrack room is the ablution room; also disconnected by a lobby, water closets and urinals. Slipper and spray baths are usually grouped in a central bath-house adjacent to the cook-house and have hot water laid on. For every two barrack rooms, a small single room is provided for the sergeant in charge. Adjacent to the barrack blocks and next to the cook-house are arranged the dining-rooms.

Next to the dining-room is the cook-house where the meals for a battalion are cooked and served direct to the dining rooms. A wash-up room, equipped with a plate washing machine and shelves for the storage of the crockery after it has been washed, is arranged off the serving-lobby. The cook-house is well lighted and ventilated by a glazed lantern with opening sashes and the cooking apparatus is designed for the economical use of coal fuel.

Under the kitchen block is a small basement containing the boiler for heating the dining-rooms and another for the supply of hot water to baths and sinks.

Not far from the barrack blocks is placed the regimental institute, or soldiers' club, where the rank and file may go for relaxation and amusement when off duty. This establishment comprises a restaurant, a large and lofty room with a stage at one end and at the other a supper bar where light refreshments are sold, a soldiers' room served by a beer bar which also serves a separate room for corporals and a jug department for the supply of families, a billiards and games room, and a reading and writing room and library. Shops are provided where the men and their families may purchase groceries and other commodities; a quarter for the manageress, a common room for the staff, an office for the checking of accounts, and the kitchen premises complete the establishment.

For the senior non-commissioned officers a sergeants' mess is provided, containing a dining-room, a reading-room and a billiard room, with kitchen premises and a liquor store, which also has a jug department for the sergeants' families. The single non-commissioned officers have all their meals in this mess, and the married members also use it as a club. The warrant officers and the proportion of non-commissioned officers and men who are on the married establishment, are provided with accommodation at some little distance from the men's barracks. The warrant officers are allowed a living room, kitchen, and scullery with three bedrooms and a bath room. The married soldiers have a living room, scullery and bath room, and one, two, or three bedrooms, according to the size of their families.

Officers' Quarters.—At a little distance from the men's barracks, and usually looking over the parade or cricket ground, is the officers' mess. This building has an entrance hall, on one side of which is the mess room (or dining room) with a band alcove, where the band plays on guest nights, and on the other the ante-room (or reading room), whilst the billiard room and kitchen are kept to the back so that lantern lights can be arranged for. A mess office is provided, and all the accessories required for the mess-waiters' department, including pantry, plate-closet and cellarage, and for the kitchen or mess-man's department; also a quarter for the mess-man. The single officers' quarters are usually arranged in a storey over the mess itself. Each junior officer has a large room, part of which is partitioned off for a bed alcove, and the field officers are allowed two rooms. The officers' servants have small rooms allotted for cleaning purposes, and bath rooms, supplied with hot water from the mess kitchen, are centrally situated. A detached house, containing three sitting rooms, seven bed and dressing rooms, bath room, kitchen, scullery and the usual accessories, is provided for the commanding officer, and smaller houses, usually semi-detached, are provided for the other regimental married officers and the quarter-master.

Regimental Accessories.—Apart from the buildings providing accommodation, others are required for administrative, educational and military purposes. These are the guard-house and regimental offices, the small-arm ammunition store, the fire-engine house, the gymnasium, the 30yd. miniature rifle ranges and classrooms for the instruction of the men when working for educational certificates, also a medical inspection block, with dispensary, where the sick are seen by a medical officer and either prescribed for or sent into hospital, as may be necessary. Stables are provided for the officers' and transport horses, and a vehicle shed and store house for the mobilization equipment. Store-rooms are required for bread, meat, coal, clothing, and for weapon-training, signalling, and general small stores under the quarter-master's charge; also workshops for armourers, carpenters, plumbers, painters and glaziers, shoemakers and tailors. Mention of the

recreation ground and parade ground completes the description of a battalion barrack.

Cavalry Barracks.—The accommodation provided for cavalry is very similar to that already described for infantry. The barrack blocks are arranged to suit the organization of the regiment and are placed so that the men can turn out readily and get to their horses. Detached buildings are provided for cavalry troop stables, one block for the horses of each troop. Each horse is given 1,500 cu.ft. of air space, the horses' heads being turned to the outer walls. Above the horses' heads are windows, while ridge ventilation and skylights are given so that all parts of the stable are well lighted and airy. Cast-iron mangers and hayracks are provided and the horses are separated by bails with chains to manger brackets and heel posts; saddle brackets are fixed to the heel posts. Each stable has a store, in which spare saddles and gear are kept; also an expense forage store, in which the day's ration, after issue in bulk from the forage barn, is kept until it is given out in feeds.

The space between the blocks of stables is paved with cement concrete to form a yard, and horse-troughs, litter-sheds and dung-pits are provided. Officers' stables are built in separate blocks, the stalls are divided by partitions and separate saddle rooms are provided. The unit sick lines are usually placed at some distance from the troop stables in a separate enclosure. They comprise infirmary stables for the sick horses, and a pharmacy for their treatment. The stables contain a number of loose boxes in addition to the stalls and the space allowed for a horse is greater than in the troop stables. A forge and shoeing shed is provided in a detached block near the troop stables. A forage barn and granary is usually built to contain a fortnight's supply and a chaff cutter is fixed close by. Cavalry regiments each have a large covered riding school and a number of open manèges for exercise and riding instruction.

Artillery, Tank Corps, etc.—The accommodation provided for horse and field artillery is arranged to suit their organization in batteries and brigades, and is generally similar to that already described, with the addition of vehicle sheds for guns and ammunition wagons and special shops for wheelers and saddlers; while mechanized field artillery require, in addition, garage accommodation for their dragons and other mechanical transport vehicles, and a small workshop for light repairs. The special buildings required by a tank battalion comprise garage accommodation for the tanks and mechanical transport vehicles, workshops for light repairs, and a school for instruction in tank maintenance. Accommodation for other units follows the above general lines.

Garrison Accessories.—*Military hospitals* are established at home and abroad for the treatment of sick officers and soldiers as well as their wives and families. Military hospitals are classified as follows: first-grade hospitals are large central hospitals serving important districts. These hospitals are complete in themselves and fully equipped for the carrying out of operations of all kinds; they generally contain wards for officers, and may have attached to them separate isolation hospitals for the treatment of infectious cases, and military families' hospitals for women and children. Second-grade hospitals are smaller in size and less fully equipped, but are capable of acting independently and have operation rooms. Third-grade hospitals or reception stations are required for small stations principally, to act as feeders to the large hospitals and to deal with accidents and non-transportable cases. Ward blocks usually have two storeys, and normally 1,200 cu. ft. of air space per patient are provided.

Army Schools are built to give slightly more liberal accommodation than is laid down as the minimum by the Board of Education, but the principles of planning are much the same as in civil elementary schools.

Garrison Churches are built when arrangements for the troops to attend divine service at neighbouring places of worship cannot well be made. Only one *Military prison* now remains, viz., Aldershot, and this is for soldiers discharged from the service with ignominy. For ordinary sentences detention barracks and branch detention barracks are attached to the military commands and districts. These are constructed in accordance with the Home Office regulations for prisons. *Barrack expense*

stores, for the issue of bedding, utensils and other stores for which the troops depend upon the Royal Army Service Corps, are necessary in all barracks; and in large stations a supply depot for the issue of provisions, with abattoir and bakery attached to it, may be necessary. In important districts large central workshops are provided for the carrying out of such repairs to guns and gun carriages, tanks, dragons and mechanical transport vehicles, etc., as cannot be undertaken by the unit repair shops. An *Engineer office*, with building yard and workshops to deal with the ordinary

FIG 2—EXTERIOR OF A MODERN TWO-STOREY BARRACK BUILDING

duties in connection with the upkeep of War Department property, is required at every station; and for large stations, such as Aldershot, it may be necessary to undertake special water supply schemes, works for disposal of sewage, and for the supply of electricity or gas for lighting the barracks. The system of roads, pipes and mains within the barracks are in all cases maintained by the Royal Engineers, as well as the buildings themselves. District and brigade officers are necessary for the administration of large units, and quarters for the general officer commanding and the headquarters staff may sometimes be required.

Training Camps.—Since the Crimean War it has been recognized that the leading principle of barrack policy must be to facilitate in peace time the training of the army for war and that this can only be done by quartering troops in large bodies in positions where they have space for training and manoeuvring. The camps at Aldershot, Colchester, Shorncliffe and The Curragh were started accordingly between 1855 and 1860 and in subsequent years the policy was continued by the construction of further training camps. On the outbreak of war in 1914, a demand arose once more for training centres and the problem of hutments had to be dealt with. It was decided to adopt a cheap design of hut, readily erected and easily adaptable to any form of temporary material, and the following types were standardized:

(a) A barrack hut, 60ft. by 20ft., for one sergeant and 24 men; (b) a dining hut, 100ft. by 28ft., for 500 men, with a scullery attached; (c) a cook-house, 60ft. by 28ft., with cooking apparatus capable of serving two dining rooms; (d) a bath house with a central heating boiler and hot and cold water laid on to showers, (e) a regimental institute, 100ft. by 28ft., containing a games and reading room, a supper room, a corporals' room, a bar and a beer cellar, with a kitchen and scullery in an annexe, (f) officers' and sergeants' messes, comprising a mess room and anteroom in one block joined by a short passage with a kitchen block, and accommodating 30 officers and 50 sergeants respectively, and (g) a hut, fitted with stoves, in which wet clothing could be dried.

The following types of hospital huts were also standardized: (a) A ward hut, 140ft. by 20ft., comprising a 24-bed ward for ordinary cases and a small ward for one special case, a nurses' duty room, a scullery and a sanitary annexe; (b) a hut, 160ft. by 28ft., containing the administrative offices, a clinical laboratory, and an out-patient department; (c) an operation hut, 51ft. by 36ft., containing the operation, anaesthetic, sterilizing, and preparation rooms, and an X-ray department; (d) a mortuary hut, 30ft. by 14ft. 8in., containing a post-mortem room, a body chamber, and a viewing room; and (e) a disinfecting hut in which all foul clothing, bedding, etc., is disinfected.

Selection of Site.—The following principles govern the selection of a site for a training camp: (1) Open ground, available

at all times for manoeuvring, and suitable positions for rifle ranges, entrenchments, etc., are essential; (2) the soil should be, preferably, gravel or chalk; there should be a good water supply and good drainage and generally healthy surroundings; (3) there must be ample means of communication by rail or by water, or by both; (4) and lastly, labour and building materials should be easily procurable, and an established system of waterworks, drainage works and electrical power is desirable, in which, by agreement, the camp might partake.

System of Grouping.—The area required for a hutted camp for an infantry battalion is about 1,100ft. by 500ft. The buildings are grouped round a parade ground about 430ft. by 300ft. in area. The officers' mess and quarters face one side; on the opposite side are the barrack huts which are grouped on either side of a central line of buildings comprising the sergeants' mess, the shower baths, dining rooms and cook-house, the drying room and the regimental institute. Flanking the parade ground are the guard-house and offices, the horse shelters, saddle and harness rooms and forage stores, the vehicle shed and the mobilization equipment store. Hutted camps for other units are designed on generally similar lines. In grouping such unit hutments into a divisional camp or cantonment, it is desirable that such buildings as the hospital, post office, power station, army ordnance stores, supply depot, etc., should be centrally situated. The main training ground should lie on one side of the camp, and as near to it as possible. The accessory services for a large cantonment comprise: (1) hospital, (2) roads and railways, (3) water supply, (4) lighting, and (5) refuse disposal and sewage.

Indian Barracks.—In India, barracks for British troops are built by the Royal Engineer officers detailed for military work duties, assisted by military foremen and by a native subordinate staff. The scale of accommodation to be provided is laid down in the Barrack Synopsis (India). In the plains the barrack rooms are lofty and airy with verandas all round and clerestory windows. Electric punkahs or fans are provided and the roofs are usually of double tiling. The allowance of space is 90sq.ft. per man in rooms 10ft. high and a separate dining room is provided in addition. In hill stations the rooms are smaller and punkahs are not provided. Recreation establishments are provided on a liberal scale and also other means of recreation, such as ball courts and fives courts, plunge baths and cricket grounds. Separate blocks of married quarters are provided, and schools for the children. Hospital accommodation on a higher scale than at home is necessary, but hill sanatoria have done much to improve the health of the troops by giving change of air, during the hot weather, to a large proportion of the men and families. Piped water supplies have replaced the old wells at most stations, and cooking and sanitary arrangements have been much improved.

Naval Barracks.—Naval barracks differ from military principally in that they keep up the system of board ship life to which the men are accustomed. Large barrack rooms are provided with caulked floors like ships' decks, and have rows of hammocks slung across them; these are stowed in the daytime when the rooms are used as mess rooms. In some places, however, separate mess rooms have been provided. Ablution and sanitary arrangements are grouped together on the basement floors. Fine recreation establishments and canteens are provided. The officers' messes have splendid public rooms, but the officers' quarters are not so large as in military barracks. Married quarters for the men are not provided, except in connection with coastguard stations.

Other Countries.—A great number of the German and French barracks are erected in the form of a large block of three or four storeys containing all the accommodation and accessories for officers, married and single non-commissioned officers and men, of a complete battalion or regiment in one building. Some of the modern barracks, however, are arranged more on the pavilion system, with separate blocks; but the single block system is well liked on account of its compactness and the facility it gives for supervision; it is also more satisfactory from the architectural point of view. The system of allotment and arrangement of accommodation for these two armies does not differ much, except

in detail, from that adopted by the British army. The floor and cubic space allotted per man is a little less; accommodation for officers is not usually provided, except to a limited extent, unless the barracks are on a country site. The German army, however, now provides every regiment with a fine officers' mess-house furnished at the public expense. Married quarters for some of the non-commissioned officers are provided, but not for privates. American barracks are arranged usually on the separate block system, placed round a post-exchange, or soldiers' club, which is a combined recreation establishment, gymnasium and sergeants' mess, with bath-house attached. They are well designed and superior finish internally is given.

See *The Barrack Synopsis* (1923); *The Handbook of Design and Construction of Military Buildings* (1905); *The Barrack Synopsis* (India). (R. G. P. H.)

BARRACUDA, a predatory, pike-shaped fish of the family Sphyrænidae. It has long, pointed jaws filled with teeth of razor-like sharpness and ranges in length from 3ft. to 8 feet. Of about 20 species inhabiting the warmer seas, the giant Australian mullet and the great picuda or becuna are thought to represent the largest and most vicious types, while the smaller, slender barracuda off the coast of southern California has the highest food value. The barracuda has been compared to the shark in its general mode of life. Many swimming tragedies attributed in the past to sharks are now credited to the barracuda. The creature also attacks netted herrings, gorging itself by cutting through the entangling net, thereby causing serious loss to the fisherman. It also disrupts whole schools of mullet and similar fish for the sheer joy of killing.

While it is only recently that the barracuda has come to be of commercial value, the inhabitants of the Shetland and Orkney islands have dried and salted this fish for years. Barracuda skins, too, were largely used before the World War for polishing and finishing wood of various kinds. In 1925 it was estimated that barracuda caught off the Pacific coast of the United States numbered 8,005,601, and had a total value of \$340,341. Because it is not easily exhausted and springs about in the most reckless fashion—having been known to leap 10ft. into the air to catch a flying fish—the barracuda makes an excellent big-game fish. The very trait that makes it dangerous to bathers—that of pursuing any moving object—renders it easy to hook.

BARRAGE, a term used by engineers for the construction of a dam across a river, checking the flow and so deepening the current or even creating a lake. In a military sense the term is used of the continuous line of artillery fire intended to hold up the advance of an enemy, or protect the advance of the combatant's own troops.

BARRANDE, JOACHIM (1799–1883), Austrian geologist and palaeontologist, was born at Saugues, Haute Loire, on Aug. 11, 1799, and educated in the École Polytechnique at Paris. He was tutor to the duc de Bordeaux (afterwards known as the comte de Chambord), grandson of Charles X., and when the king abdicated in 1830 Barrande accompanied the royal exiles to Prague. The first volume of his important work, *Système silurien du centre de la Bohême* (dealing with trilobites), appeared in 1852; and from that date until 1881 he issued 21 quarto volumes of text and plates. Two other volumes were issued after his death, in 1887 and 1894. He died at Frohsdorf on Oct. 5, 1883.

See "Sketch of the Life of Joachim Barrande," *Geol. Mag.* (1883), p. 529 (with portrait).

BARRANQUILLA, a city and port of Colombia, South America, capital of a province of the same name in the department of Atlantico, on the left bank of the Magdalena river about 7m. above its mouth and 18½m. by rail from its seaport, Puerto Colombia. Pop. (1928 Est.) 90,000. Dangerous bars at the mouth of the Magdalena are being removed by dredging, so that eventually ocean-going ships may proceed directly to the city. The production of large quantities of petroleum a few hundred miles up the Magdalena, some of which is marketed via Barranquilla, and the growing of cotton in the region of the city are responsible for renewed activity in various lines of business. A recent foreign loan is largely responsible for the newer part of Barranquilla, called El Prado, where many modern streets, houses and several

boulevards have been constructed. At Puerto Colombia, a short distance westward, a steel pier, 4,000ft. in length, facilitates handling of freight. The city of Barranquilla was founded in 1629, but attracted no attention as a commercial centre until about the middle of the 19th century, when efforts were initiated to secure the trade passing through Cartagena. The city is built on a low plain, is regularly laid out, and has many fine warehouses, public buildings and residences, but part consists of mud-walled cabins supported by bamboo (*guadua*) framework. The water-supply is drawn from the Magdalena, and the city is provided with telephone, electric light and tram services. Suburban highways and an increasing number of automobiles are rapidly changing the city's transportation facilities. Airplane service from Barranquilla to Jirardot (for Bogotá) is in successful operation and saves much time for travellers.

BARRAS, PAUL FRANÇOIS NICOLAS, COMTE DE (1755-1820), member of the French Directory of 1795-99, was descended from a noble family of Provence, and before the Revolution took part in the French campaigns in India. In 1789 he adopted extreme democratic principles and was counted a Jacobin in the Convention, which he entered as deputy for the Var. Much of his time, however, was spent in missions to the districts of the south-east of France; and in this way he made the acquaintance of Bonaparte at the siege of Toulon. In 1794 his share in the anti-Robespierist *coup d'état* of 9 Thermidor brought him almost to the front rank. In the next year, when the Convention was threatened by the royalist revolt of Vendémiaire it appointed Barras to command the troops engaged in its defence. His nomination of Bonaparte as one of his subalterns led to the famous "whiff of grapeshot" which shattered the royalist forces, and Barras became one of the five Directors who controlled the French republic. He was partially responsible for arranging the marriage between Bonaparte and one of his own many cast-off mistresses, Josephine de Beauharnais; and was probably also responsible for the appointment of Bonaparte to the command of the army of Italy in 1796. Barras, who made no secret either of his venality or of his prodigious sexual immorality, nevertheless acquired great prestige from Bonaparte's victories, but during the absence of the latter on his Egyptian campaign (1798) the popularity of the whole Directory rapidly declined. Barras undoubtedly assisted Bonaparte in his *coup d'état* of the 18th Brumaire, but the latter realized that Barras's unconcealed and indeed flaunted licentiousness made him useless to the new régime. Barras found his political career at an end, nor did he succeed after 1814 in inducing Louis XVIII. to take him seriously as a royalist supporter.

Barras left memoirs in a rough state to be drawn up by his literary executor, M. Rousselin de St Albin. The amount of alteration which they underwent at his hands is not fully known; but M. George Duruy, who edited them on their publication in 1895, has given fairly satisfactory proofs of their genuineness. For other sources respecting Barras see the *Memoirs* of Cohtier, Larevellière-Lépeaux and de Lescure; also Sriout, *Le Directoire* (1895-97), A. Sorel, *L'Europe et la Révolution française* (esp. vol. v. and vi., 1903-04), and A. Vandal, *L'Avènement de Bonaparte* (1902-04).

BARRATRY, in English criminal law, is the indictable common law misdemeanour (more usually called *common barratry*) of habitually inciting and stirring up quarrels in disturbance of the peace, either in courts or elsewhere, and is punishable by fine and imprisonment. In 8 Co. Rep. 36 it is defined as "habitually to move, excite or maintain suits and quarrels." By a statute of 1726, if the person guilty of common barratry belonged to the profession of the law, he was disabled from practising in the future. For nearly two centuries there had been no record of an indictment having been preferred for this offence, but in 1880 a case occurred at the Guildford summer assizes, *R. v. Bellgrove* (*The Times*, July 8, 1889). As, however, the defendant was convicted of another offence, the charge was not proceeded upon.

In *marine insurance* barratry is any kind of fraud committed upon the owner or insurers of a ship by a master with the intention of benefiting himself at their expense. In bills of lading it is usual to except it from the shipowners' liability (see **AFREIGHTMENT**).

BARRE, a city of Washington county, Vt., U.S.A., in the north-central part of the State, 7m. S.E. of Montpelier, on Stephens branch of the Winooski river. It is served by the Central Vermont and the Montpelier and Wells River railways. The population in 1920 was 10,008, of whom 3,300 were foreign born. Barre is in the midst of large granite quarries, and its leading manufactures are monuments, tombstones, quarry machinery and pneumatic tools. The aggregate output of its 121 establishments in 1925 was valued at \$9,261,717. There is a fine granite statue of Robert Burns, by J. Massey Rhind, presented in 1899 by the Scotsmen of the city. The town was organized in 1793, named after Isaac Barré (1726-1802), a defender of American rights in the British parliament, and the present city was chartered in 1894.

BARREL, a vessel of cylindrical shape, made of staves bound together by hoops, a cask; also a dry and liquid measure of capacity, varying with the commodity which it contains (see **WEIGHTS AND MEASURES**). It is a word of uncertain origin common to Romance languages. The term barrel is applied to many cylindrical objects, e.g., to the drum round which the chain is wound in a crane, a capstan or a watch; to the cylinder studded with pins in a barrel-organ or music-box; to the hollow shaft in which the piston of a pump works; or to the tube of a gun. The "barrel" of a horse is that part of the body lying between the shoulders and the quarters. For the system of vaulting in architecture known as "barrel-vaulting," see **VAULT**.

BARREL-ORGAN, a small portable organ mechanically played by turning a handle. The barrel-organ owes its name to the cylinder on which the tunes are pricked out with pins and staples of various lengths, set at definite intervals according to the scheme required by the music. The function of these pins and staples is to raise balanced keys connected by simple mechanism with the valves of the pipes, which are thus mechanically opened, admitting the stream of air from the wind-chest.

Barrel-organs have been made with as many as three or four cylinders set in a circular revolving frame, but these more elaborate instruments were mainly used in churches and chapels, a purpose for which they were in great demand during the 18th and early 19th centuries. As long ago as the 15th century barrel-organs were known in Holland, where they are believed to have been invented.

BARREL VAULT, in architecture, a continuous or tunnel vault (*q.v.*), the cross section of which is the same throughout its length; a continuous arch (*q.v.*).

BARREN ISLAND, a volcanic island lying off the Andamans in the Bay of Bengal. It is irregularly circular and about 2m. in diameter, with an outer rim 700 to 1,000ft. in height and a central cone 1,015ft. high. This cone rises from a depth of 800 fathoms below the sea. It was active between 1789 and 1832.

BARRÈS, MAURICE (1862-1923), French writer and politician, was born at Charmes (Vosges) on Sept. 22, 1862. Maurice Barrès always considered himself a Lorrainer, charged with the interpretation and the vindication of his own people. His school days were spent at the Lycée of Nancy, and, immediately after, he made his literary *début* with some ironical pamphlets which successfully displayed his intellectual "dandysme." Renan paid him the compliment of being annoyed by his *Huit jours chez M. Renan* (1888).

He enhanced his reputation by the three volumes of the *Culte du moi*, which appeared from 1888 to 1891. They provoked much ridicule in the Press, but the humour, charm and "prétiosité" with which he developed his theme of the cultivation of the "ego," and thus a harmonious inner life, was hailed with delight by the younger generation. Many of the ideas which permeate his later works may be found in his second work *Un homme libre* (1889), which exercised a considerable influence on his generation. The section dealing with Lorraine was described by Ernest Lavisse as an admirable piece of historical psychology. His third book, *Le jardin de Bérénice* (1891), a novel, showed great delicacy of feeling and subtlety of style, and was inspired by the author's electoral campaign at Nancy as Boulangist candidate. He was only 26 when he was elected to the chamber, and from that time he led a life divided between literature and politics.

Intelligent, ardent, ambitious, modelling himself now on Benjamin Constant and now on Disraeli, Barrès, during the period between the end of Boulangism and the Dreyfus case, hesitated as to the wisest course to pursue. He stood for one of the Paris divisions as a Socialist patriot, and was defeated. In 1892, he wrote a short novel, *L'ennemi des lois*, the subject of which was anarchy. He travelled in Italy and in Spain. He edited for about six months a paper called *La Cocarde*. Maurras was his colleague in this venture, and together they roughly blocked out the future doctrines of the French Nationalist Party.

In 1897, he began the publication of his most important work, *Le roman de l'énergie nationale*. The generation and milieu described are his own. His characters are types rather than living beings, but as a delineation of a period it may be ranked with *Le Rouge et le Noir* and *L'Éducation sentimentale*. The second volume, *L'appel au soldat*, contains a vivid account of the Boulangist Movement, and the third, *Leurs figures*, a picture of parliamentary life at the time of the Panama affair, bears comparison with the pages of Saint-Simon.

The Dreyfus case, in which he took an active interest, made him a vehement Nationalist. He now assumed the position of spokesman for Lorraine, and undertook the series entitled *Bastions de l'Est. Au service de l'Allemagne* (1905) describes the year of military service under Germany of a young Alsatian, and *Colette Baudoche* (1909) tells the story of a young girl from Metz. The war brought these books a rather artificial success as propaganda. Meanwhile, Barrès was writing admirable descriptions of travel in France—*Les amitiés françaises* (1903), in Greece—*Le voyage de Sparte* (1906), in Spain—*Greco* (1912). They contain some of his best work, and some of the finest prose in the language.

The war was the apotheosis of his doctrines. He redoubled his activities. His work as a journalist had always been remarkable in quality, it now became remarkable in quantity also. He achieved the feat of writing an article for the *Echo de Paris* every day for four years. These, when they were re-issued in the long series, *L'âme française et la guerre* (1915-19), did not retain their original popularity.

After the war, Barrès carried on his rôle as defender of the French Eastern front by a mediocre work, *Le génie du Rhin* (1921). He returned to pure literature with his novel *Un jardin sur l'Oronte* (1922), which derives its inspiration from his earlier travels in the East. These he described in *Une enquête aux pays au Levant*, which appeared in 1923 on the very day, Dec. 5, of the author's sudden death in Paris from heart failure. He left much unpublished work, the materials for the autobiography, *Mémoires*, on which he was engaged, and a large correspondence, which will probably prove to be one of the most interesting of his generation.

He was, when he died, even more than Anatole France, the most significant figure among contemporary French men of letters. The influence of his political thought had worn itself out, but his literary authority still swayed the younger generation. He had the power to charm. The prejudices, the narrowness and the egotism, with which he had been reproached, gradually disappeared. The qualities of sympathy and reverence always commanded his esteem, and his epic of the countryside, *La colline inspirée* (1913), reveals the springs of his religious life. His old age would have been fruitful, and his death deprived us of recollections which might have rivalled *Les Mémoires d'outre-tombe*. Of all French writers he may best be compared with Chateaubriand. Like Chateaubriand he created but one living figure, himself, but into that figure he breathed the soul of contemporary France, and thereby captured the heart of his generation.

(A. TH.)

BARRETT, LAWRENCE (1838-1891), American actor, was born of Irish parents in Paterson (N.J.), April 4, 1838. His family name was Brannigan. He made his first stage appearance at Detroit as Murad in *The French Spy* in 1853. In Dec. 1856 he made his first New York appearance at the Chambers Street Theatre as Sir Thomas Clifford in *The Hunchback*. He served with distinction in the Civil War as captain in the 28th Massachu-

setts infantry regiment. From 1867 to 1870, with John McCulloch, he managed the California Theatre, San Francisco.

Among his many parts may be mentioned Hamlet, Lear, Macbeth, Shylock, Richard III., Wolsey, Benedick, Richelieu, David Garrick, Hernani, Alfred Evelyn, Lanciotto in George Henry Boker's (1823-90) *Francesca da Rimini*, and James Harebell in *The Man o' Airlie*. He played Othello to Booth's Iago and Cassius to his Brutus. He acted in London in 1867, 1881, 1883 and 1884. His Richelieu in Bulwer Lytton's drama was considered his best part. He wrote a life of Edwin Forrest in the *American Actors Series* (Boston, 1881), and an admirable sketch of Edwin Booth in *Edwin Booth and his Contemporaries* (Boston, 1886). He died March 20, 1891.

BARRETT, WILSON (1846-1904), English actor, manager, and playwright, was born in Essex on Feb. 18 1846, the son of a farmer. After experience in acting and management in the provinces, in 1879 he took the old Court theatre, where he introduced Madame Modjeska to London, in adaptations of *Maria Stuart*, *Adrienne Lecouvreur*, *La Dame aux Camélias* and other plays. In 1881, he took the Princess's theatre, and became famous in melodrama—*The Lights of London*, by G. R. Sims, *The Silver King*, by Henry Arthur Jones (1882), and *Claudian*, by W. G. Wills. Later he acted chiefly in the provinces. In 1886 he made his first visit to America, and in 1898 visited Australia. During these years the London stage was coming under new influences, and Wilson Barrett's vogue in melodrama had waned. But in 1895 his drama of religious emotion, *The Sign of the Cross*, attracted audiences outside the ordinary circle of playgoers. He died on July 22 1904.

BARRHEAD, police burgh, Renfrewshire, Scotland, on the Levern, 7½m. S.W. of Glasgow by the L.M.S. railway. Pop. (1921) 11,466. Founded in 1773, it has absorbed Arthurlie, Dovecothall and Grahamston. It does bleaching, calico-printing, cotton-spinning, weaving, iron and brass founding, engineering and the manufacture of sanitary appliances. Neilston (pop of parish, 15,260), about 2m. S.W., has bleachfields and print-works, and 2m N.byE. lie Hurlet, making alum and other chemicals, and Nitshill with chemical works, quarries and collieries.

BARRICADE or **BARRICADO**, an improvised fortification of earth, paving-stones, trees or any materials ready to hand, thrown up, especially across a street, to hinder the advance of an enemy; in the old wooden warships a fence or wooden rail, supported by stanchions and strengthened by various materials, extending across the quarter-deck as a protection during action. The word is derived from Spanish *barrica*, "a cask," casks filled with earth having been early used to form barricades.

BARRIE, SIR JAMES MATTHEW, O.M. (1860-), British novelist and dramatist, was born at Kirriemuir, in Forfarshire, Scotland, May 9, 1860. He began to write even before he went to school and, while he was a student at Edinburgh University, almost finished a three-volume novel. In 1883 he became leader-writer on the *Nottingham Journal*, and his career as a man of letters may be said to have begun in the following year with the appearance of an article, entitled "An Auld Licht Community," in a London paper, the *St. James's Gazette*. Frederick Greenwood, editor of the paper, gave the young writer such encouragement that he moved to London in 1885; and in 1887 appeared his first book, *Better Dead*, a jeu d'esprit based on his contributions to journalism. In 1888 *Auld Licht Idylls*, a volume of sketches of life in his native village, revealed to the world the genius of a new master of humour and pathos, and the same year saw the publication of *When a Man's Single*, a novel of journalistic life, and *An Edinburgh Eleven*, sketches of famous Edinburgh men. *A Window in Thrums*, published in 1889, set the seal on his fame as a master of what has been called Kailyard fiction (q.v.). Two further books appeared in 1891—*My Lady Nicotine*, which contains some of the most amusing literature ever written about smoking, and *The Little Minister*, in which he interwove the humours of Thrums with a romantic love-story. It was about this time that Barrie began to write for the theatre, and his first play, *Walker, London* (1893), won immediate success, with J. L. Toole in the chief part. There was more of the

idyllic and sentimental genius of the author in his next successful comedy, *The Professor's Love-Story* (1895). Meanwhile, in 1894, Barrie had published his beautiful autobiographical study of his early life with his mother, *Margaret Ogilvy*, and we suspect the presence of an autobiographical element again in *Sentimental Tommy*, a novel at once sympathetic and mocking, about a young Scot with an "artistic temperament," which was published in 1895. This and its sequel, *Tommy and Grizel* (1900), were Barrie's last essays in prose fiction, and with all their merits they showed that he was aiming at something outside the range of his genius. He was more happily inspired in *The Little White Bird* (1902) in which we get our first introduction to the fantastic world of Peter Pan.

It was on the stage, however, that Barrie was to pour out his genius in the greatest abundance and variety. His early plays, including the stage version of *The Little Minister* (1897), contain only faint hints of the dramatist who in the year 1903 was to hold the stage with no fewer than three plays (*Quality Street*, *The Admirable Crichton* and *Little Mary*), and who in 1904 was to endear himself to the nursery with *Peter Pan*, which has been described as "a kind of poetical pantomime." This was followed by *Alice-Sit-by-the-Fire* (1905), and by *What Every Woman Knows* (1908). *Peter and Wendy*, which was published in 1911, was only a kind of pendant to *Peter Pan*. As for the plays written since that time, Barrie became more expert, as he grew older, in preserving the balance between comedy and pathos, and more daring in preaching from the stage the very simple gospel that is to be found in his rectorial address, delivered at St. Andrews University, on Courage. In that address (1922) he described his business in life as "playing hide and seek with angels," and in most of his later work will be found an underlying appeal to make life, as far as is possible, a game with angels, to become as little children, and to prefer a heavenly failure to a too-worldly success. This is the dominant theme in *The Will*, a short and sentimental play produced in 1913, where we see the folly of success expounded in terms of commonplace life without the author's usual fantastic elaborations. *The Twelve Pound Look*, which belongs to about the same period, is a more comic treatment of the same theme.

Barrie is, in the general opinion, more infallibly an artist in his comedy than in his pathos, and *The Twelve Pound Look* is, perhaps, the most successful of all his one-act plays. *Pantaloons* and *Rosalind* are two other one-act pieces which are published in the same volume with *The Twelve Pound Look* in the collected edition. They are both plays of mixed comedy and pathos. Another and longer play written during this period was *The Adored One*, which was censured by a number of critics on the ground that it was a joke about a murder. Barrie's war plays are of no permanent importance. *A Kiss for Cinderella* (1916), though in some respects a comedy of the World War, does not depend on the War for its chief appeal, but is the fullest expression of the genius of Barrie that playgoers had had since those marvellous years, 1903 and 1904. In *A Kiss for Cinderella* we realize how near is the author's genius to that of Hans Andersen, on the one hand, and of Dickens, on the other. Like Hans Andersen he mixes the everyday world with fairyland, and like Dickens he entices us to that borderland of laughter where we suddenly find ourselves in tears. There surely never was a play in which the

THE "PETER PAN" STATUE IN KENSINGTON GARDENS, LONDON

dramatist played "hide and seek with angels" to better purpose. In 1917, he produced *Dear Brutus*, a comedy with tragic implications, which takes us into still remoter regions of dreamland than we visit in *A Kiss for Cinderella*. In *Mary Rose* (1920), as in *A Kiss for Cinderella*, and *Dear Brutus*, we travel from reality into dreamland or into ghostland, and his comedy more than ever seems to be tinged with a deep sense of human tragedy. His only play since *Mary Rose* has been his one-act enigma, *Shall We Join the Ladies?* (1922). Barrie received a baronetcy in 1913, and the Order of Merit was conferred on him in 1922.

BARRIE, capital of Simcoe county, Ontario, Canada, 56m. N. of Toronto, on Lake Simcoe, an important centre on the Canadian National railway. It contains planing mills, boat-building and railway shops, and manufactories of leather, boots and shoes. It is also a summer resort. Pop. (1921) 6,936.

BARRIER ACT, an act passed by the General Assembly of the Church of Scotland in 1697 guarding against hasty legislation by the provision that acts involving a change in the Church law must be approved by the presbyteries and by the General Assembly.

BARRIÈRE, THÉODORE (1823–1877), French dramatist, signed, alone or in collaboration, over 100 plays; among the most successful were: *La Vie de bohème* (1849), adapted from Henri Murger's book with the novelist's help; *Manon Lescaut* (1851); *Les Filles de marbre* (1853); *L'Héritage de Monsieur Plumet* (1858); *Les Faux Bonshommes* (1856) with Ernest Capendu; *Malheureux vaincus* (1865), which was forbidden by the censor; *Le Gascon* (1878). Barrière died in Paris on Oct. 16 1877.

See *Revue des deux mondes* (March 1859).

BARRIER REEF. The Great Barrier Reef, the largest continuous mass of coral in the world, lies off the north-east coast of Australia and extends virtually from New Guinea south of the Fly River delta (Bramble cay: 9° 15' S, 153° 20' E) to about Sandy cape (24° 30' S, 150° 20' E), a distance of 1,100 nautical (1,260 statute) miles. On the north its termination is probably due to the fresh muddy waters of the Fly river, on the south to the increasing coolness of the waters (68° F). It follows fairly closely the edge of the continental shelf—which here apparently represents a submerged (Pleistocene?) coastline—at about 50 fathoms. Beyond it steep submarine slopes lead down to depths of over 100 fathoms: behind it are depths of 10–25 fathoms, and towards the south of 40–60 fathoms, for the most part over a sandy bottom. In the north (Cape York peninsula) the reef keeps within 20 m. of the coast and here it is composed of sections each a few miles long separated by gaps a mile wide. Farther south it draws away to distances of 120–150 m. from the coast and also gradually breaks up into small scattered clusters. Throughout its length it varies greatly in width. Between the reef and the mainland are numerous islands, those adjoining the coast being often lofty, rugged and densely wooded fragments of the hill ranges behind. Here the muddiness or freshness of the water (Burdekin, Fitzroy, etc. rivers) operates against coral growth, and the small flat coralline islets (atolls) are in clearer waters farther out. Much discussion has centered around the formation and precise significance of the Barrier Reef. Of the two main hypotheses—the "glacial-control" hypothesis which postulates a rise in the sea-level due to melting ice, and the subsidence theory—the latter has gained most support. Trial borings (Funafuti, Ellice islands in 1903; Oyster cay, 22 m. N.E. of Cairns, 1926) have proved inconclusive, but the numerous evidences of submergence and "drowning" of coastal features in this region (*cf.* the recent and perhaps still continuing subsidence of the sea-floor north of Sandy cape) support other indications that the coral has grown upon or near the sinking rim of the continent. The outer (eastern) face of the coral is the most active and vigorously growing part, rearing nearly perpendicular walls from depths of 20–25 fathoms to a little below low-tide level. Above this the coral is dead and is smashed by storms into blocks which are piled up (*cf.* the "negro-heads," isolated blocks standing up above high-water level), ground into sand, re-compacted and ultimately form steep-sided banks and low flat-topped islets. Behind the permanently

submerged growing "front," with its well-known, but almost unbelievable, riot of colour and animal life, and its tidally submerged or above-water bank, is a zone of feebler and more irregular growth studded with numerous basins and holes. This zone sinks gradually westwards and from it rise mushroom-topped pinacles of growing coral. Each segment of reef had its "plan" determined mainly by prevailing wind and wave direction, being usually curved in at either end and tending to form a closed oval, which then often fills up and becomes a "cay." The coral islets are colonized fairly rapidly by a select assemblage of salt-tolerant plants whose seeds are borne by birds, winds or waves—mangroves, casuarinas, pandanus palms and other creeping and flowering types. (Coconut palms are never "self-sown" here.) The rich and varied animal life includes many gaily-coloured fish, sea-urchins with poisonous spines, giant clams, star-fish, etc. Pearl oysters, once very plentiful, are still systematically fished, and these, with the trochus shell (resembling a large periwinkle) yield considerable quantities of the mother-of-pearl of trade. Another important economic product is the *bêche-de-mer* (trepang) or sea-cucumber, which is boiled, dried and exported in great bulk to China. Dugong, turtles and sponges (the "hard" variety) occur but are not as yet much exploited. The interior passage-way (the "Grand Canal") offers a fairway for vessels trading up this coast—sheltered and calm, while outside the breakers form a long line of surf. But the numerous rocks and reefs, the hurricanes which occur as far south as lat. 16° S., the tides which, pent in the narrows, rise in places 30 ft., and in the north the narrowness and complexity of the passageways make this also one of the most dangerous coasts of Australia. Numerous Barrier Reef problems have been systematically studied in Australia and a scientific expedition organised by the British Association went out in 1928 to undertake further investigations.

BARRIER TREATY, the name given first to the treaty signed on Oct. 29, 1709, between Great Britain and the states general of the United Netherlands, by which the latter engaged to guarantee the Protestant succession in England in favour of the house of Hanover; while Great Britain undertook to procure for the Dutch an adequate *barrier* on the side of the Netherlands, consisting of a number of fortified towns, together with the citadel of Ghent. (Cf. the Treaty of Ryswick, 1697, *q.v.*) A second Barrier treaty was signed between Great Britain and Holland on Jan. 29, 1713, the terms of which were included in the Treaty of Rastatt, between the emperor and France, signed on March 7, 1714. A third Barrier treaty was signed in Nov. 1715.

BARRILI, ANTONIO GIULIO (1836–1908), Italian novelist, was born at Savona, and was educated for the legal profession, which he abandoned for journalism in Genoa. He was a volunteer in the campaign of 1859 and served with Garibaldi in 1866 and 1867. From 1865 (*Capitan Dodero*) onwards he published many popular novels. Some of the best of the later ones are *Santa Cecilia* (1886), *Come un Sogno* (1875), and *L'Olmo e l'Edera* (1877). His *Raggio di Dio* appeared in 1890. Barrili also wrote two plays and various volumes of criticism, including *Il rinnovamento letterario italiano* (1890). He was elected to the Italian chamber of deputies in 1876; and in 1889 became professor of Italian literature at Genoa.

BARRING-OUT. The most typical example of this practice was at Bromfield school, Cumberland, where "it was the custom, time out of mind, for the scholars, at Fasting's Even (the beginning of Lent), to depose and exclude the master from the school for three days." During this period the school doors were barricaded and the boys armed with mock weapons. If the master's attempts to re-enter were successful, extra tasks were inflicted as a penalty, and willingly performed by the boys. On the third day terms of capitulation, usually in Latin verse, were signed, and these always conceded the immediate right to indulge in football and a cockfight. The custom was long retained at Eton and figures in many school stories.

BARRINGTON, DAINES (1727–1800), English lawyer, antiquary, and naturalist, fourth son of the first Viscount Barrington, was appointed a Welsh judge in 1757 and afterwards second justice of Chester. Though an indifferent judge, his *Observations*

on the Statutes, chiefly the more ancient, from Magna Charta to 21st James I., cap. 27, with an appendix, being a proposal for new-modelling the Statutes (1766), had a high reputation among historians and constitutional antiquaries. Many of his other works are included in a volume of *Miscellanies on Various Subjects* (1781).

BARRINGTON, GEORGE (b. 1755), an Irishman with a curious history, was born at Maynooth on May 14, 1755, the son of a working silversmith named Waldron. In 1771 he robbed his schoolmaster at Dublin and ran away from school, finally joining the manager of a touring theatrical company in pocket-picking. He came to London, where he continued his pocket-picking, and after serving several long terms of imprisonment, he was sentenced in 1790 to seven years' transportation. On the voyage out to Botany bay a conspiracy was hatched by the convicts on board to seize the ship. Barrington disclosed the plot to the captain, and the latter, on reaching New South Wales, reported him favourably to the authorities, with the result that in 1792 Barrington obtained a warrant of emancipation (the first issued), becoming subsequently superintendent of convicts and later high constable of Paramatta. In 1796 a theatre was opened at Sydney, the principal actors being convicts, and Barrington wrote the prologue to the first production. The prologue contains the well-known lines:

True patriots we, for, be it understood
We left our country for the country's good.

Barrington died at a ripe old age at Paramatta, but the exact date is not on record. He was the author of *A Voyage to Botany Bay* (1801); *The History of New South Wales* (1802); *The History of New Holland* (1808).

See *Life, Times and Adventures of George Barrington* (1820?), and *The Genuine Life and Trial of George Barrington* (1790); *The Memoirs of George Barrington* (1790).

BARRINGTON, JOHN SHUTE, 1ST VISCOUNT (1678–1734), English lawyer and theologian, was the son of Benjamin Shute of Theobalds, Herts, and took the name of Barrington on succeeding to an estate. He was created an Irish peer as Viscount Barrington of Ardglass in 1720. Employed by Lord Somers to induce the Scottish Presbyterians to accept the union with England, he was rewarded by a place in the customs, which he lost on the change of administration in 1711. He became M.P. for Berwick in 1714, but was expelled from the House of Commons in 1723 for having taken part in the Harburg lottery. Shute was a champion of the civil rights of Protestant dissenters, and wrote some theological works. He died on Dec. 14, 1734.

BARRINGTON, SAMUEL (1720–1800), British admiral, son of the 1st Viscount Barrington. He entered the navy, and in 1747 had worked his way to a post-captaincy. On the outbreak of the Seven Years' War he served with Hawke in the Basque roads in command of the "Achilles." In 1759 the "Achilles" captured a powerful French privateer, in the Havre-de-Grace expedition of the same year carried the flag of Rear-Admiral Rodney, and in 1760 sailed with John Byron to destroy the Louisbourg fortifications. Barrington was next appointed in 1768 to the frigate "Venus" as governor to the duke of Cumberland. In 1778 he became rear-admiral and went to the West Indies, where he took the island of Santa Lucia from the French, and repulsed the attempt of the Comte d'Estaing to retake it. Superseded in 1779 by Byron, he refused the command of the Channel fleet offered him on his return home. He took part in the relief of Gibraltar in October 1782, and as admiral he flew his flag for a short time in 1790, but was not employed in the French revolutionary wars. He died in 1800.

See Ralfe, *Naval Biographies*, i. 120; Charnock, *Biographia Navalis*, vi. 10.

BARRINGTON, SHUTE (1734–1826), youngest son of the 1st Viscount Barrington (*q.v.*), educated at Eton and Oxford, became successively bishop of Llandaff in 1769, Salisbury in 1782, Durham in 1791. He was a Protestant who was willing to grant Catholics "every degree of toleration short of political power," but he was most generous and kind to the emigrant French bishops and clergy. He was the last but one of the so-called Prince Bishops

of Durham, and as such was Count Palatine and *custos rotulorum*, with almost royal jurisdiction and precedence, and he well supported the dignity of his station. He died on March 25, 1826.

BARRINGTON, WILLIAM WILDMAN SHUTE, 2ND VISCOUNT (1717–1793), eldest son of the 1st Viscount Barrington, was born on Jan. 15, 1717, and died at Becket on Feb. 1, 1793. He was returned to Parliament in March 1740 as member for Berwick-upon-Tweed. In 1755 he was made a privy councillor and secretary at war, and in 1761 was appointed chancellor of the exchequer. In 1762 he became treasurer of the navy and in 1765 returned to his former position of secretary at war until Dec. 1778; during four months in 1782 he was joint postmaster-general.

See Shute Barrington, *Political Life of William Wildman, Viscount Barrington* (1814).

BARRISTER, in England and Ireland the term applied to the highest class of lawyers who have exclusive audience in all the superior courts. Every barrister in England must be a member of one of the four ancient societies called Inns of Court, viz., Lincoln's Inn, the Inner and Middle Temples, and Gray's Inn, and in Ireland, of the King's Inns. The existence of the English law schools can be traced back to the 13th century. Associations of lawyers acquired houses of their own in which students were educated in the common law, and the degrees of barrister (corresponding to apprentice or bachelor) and serjeant (corresponding to doctor) were conferred. These schools of law are now represented by the Inns of Court (*q.v.*).

Both sexes are admitted as members of the Inns of Court, on paying certain fees and on passing a general (elementary) examination or (alternatively) producing evidence of having passed a public examination at a university; their subsequent call to the bar depends on their keeping 12 terms (of which there are four in each year), and passing certain further examinations (see *ENGLISH LAW ad fin.*). A term is "kept" by dining six times (three for a student whose name is on the books of a university) in hall. The profession of barrister is open to almost every one; but no person connected with the law in any inferior capacity or who is a chartered or professional accountant, can enter an Inn of Court as a student until he has entirely and bona fide ceased to act or practise in such capacity. Some of the Inns also make a restriction that their members shall not be engaged in trade. A form of admission has to be filled up, containing a declaration to this effect, and mentioning *inter alia* the age, nationality, condition in life and occupation of the applicant. Previous to the student's call this declaration must be repeated, and he must further declare that he is not in holy orders, has not held any clerical preferment and has not performed any clerical functions during the year preceding. Subject to the above, practising solicitors of not less than five years' standing may be called to the bar without keeping any terms, upon passing the necessary examinations, and, *per contra*, a barrister of the same standing may, without any period of apprenticeship, become a solicitor upon passing the final examination for solicitors. Irish barristers of three years' standing may be called to the English bar without passing any examination upon keeping three terms, and so also may barristers of those colonies where the professions of barrister and solicitor are still kept distinct. No one can become a barrister till he is 21 years old.

The benchers of each Inn of Court may reject any applicant for membership with or without cause assigned; and for sufficient reasons, subject to an appeal to the judges as visitors of the Inns, they may refuse to call a student to the bar, or may expel from their society or from the profession ("dis-bar" or "dis-bench") barristers or benchers.

The peculiar business of barristers is the advocacy of causes in open court, but in England a great deal of other business falls into their hands. They are the equity draftsmen and special pleaders. The higher rank among barristers is that of king's or queen's counsel. They lead in court, and give opinions on cases submitted to them, but they cease to practise as equity draftsmen or special pleaders and to take pupils. Precedence among king's counsel, as well as among outer barristers, is determined by seniority. A king's counsel is appointed by letters patent to be "one of His

Majesty's counsel learned in the law." The appointment rests with the lord chancellor, to whom the barrister desiring a silk gown makes application. There is no definite time required to elapse between "call" and application for a seat within the bar, but it is generally understood that a barrister must be of at least 10 years' standing before he is appointed a king's counsel. The first king's counsel was Sir Francis Bacon, who was appointed by James I., and received a payment of a fee of £40 a year. Succeeding king's counsel received a similar payment, until its abolition in 1831. There was not another appointment of a king's counsel until 1668, when Francis North was so honoured. From 1775 king's counsel may be said to have become a regular order. Their number was very small so late as the middle of the 19th century (20 in 1789; 30 in 1810; 28 in 1850), but at the beginning of the 20th century there were over 250. A king's counsel may not, unless by special licence, take a brief against the crown, but such a licence is never refused unless the crown desires his services in the case. The old order of serjeants-at-law (*q.v.*) is now extinct. Although every barrister has a right to practise in any court in England, each special class of business has its own practitioners, so that the bar may almost be said to be divided into several professions. The most marked distinction is that between barristers practising in chancery and barristers practising in the courts of common law. The fusion of law and equity brought about by the Judicature Acts 1873 and 1875 was expected in course of time to break down this distinction; but to a large extent the separation remains. Common law counsel usually attach themselves to a circuit and to one or more quarter sessions. Business before the court of probate, divorce and admiralty, the privy council and parliamentary committees, also exhibits this tendency to specialization. In some of the provincial cities there are also local bars. The bar of Ireland presents generally the same features as the bar of England. For the Scottish bar, see under *ADVOCATES, FACULTY OF*. There is no connection whatever between the Scottish and English bars.

Counsel is not answerable for anything spoken by him relative to the cause in hand and suggested in the client's instructions, even though it should reflect on the character of another and prove absolutely groundless, but if he mention an untruth of his own invention, or even upon instructions if it be impertinent to the matter in hand, he is then liable to an action by the party injured. Counsel may also be punished by the summary power of the court or judge as for a contempt, and by the benchers of the inn to which he may belong on cause shewn.

The rank of barrister is a necessary qualification for nearly all offices of a judicial character, and a very usual qualification for other important appointments. Not only the judgeships in the superior courts of law and equity in England and in her colonies, but nearly all the magistracies of minor rank—recorderships, county court judgeships, etc.—are restricted to the bar. The result is a unique feature in the English system of justice, viz. the perfect harmony of opinion and interest between the bar as a profession and all degrees of the judicial bench. Barristers have the rank of esquires, and are privileged from arrest whilst in attendance on the superior courts and on circuit, and also from serving on juries whilst in active practice.

Barristers cannot maintain an action for their fees, which are regarded as gratuities, nor can they, by the usage of the profession, undertake a case without the intervention of a solicitor, except in criminal cases, where a barrister may be engaged directly, by having a fee given him in open court, nor is it competent for them to enter into any contract for payment by their clients with respect to litigation.

See J. R. V. Marchant, *Barrister-at-law: an Essay on the legal position of Counsel in England* (1905), Holdsworth, *History of English Law* vol. vi.

BARROIS, CHARLES (1851–). French geologist, was born at Lille, on April 21, 1851, and studied geology there under Prof. Jules Gosselet. To this master he dedicated his first comprehensive work, *Recherches sur le terrain crétacé supérieur de l'Angleterre et de l'Irlande*, published in the *Mémoires de la société géologique du Nord* in 1876. In this essay the palaeontological zones in the Chalk and Upper Greensand of Britain were

for the first time marked out in full detail. In the year 1876 Dr. Barrois was appointed a collaborateur to the French Geological Survey, and in 1877 professor of geology in the University of Lille.

BARROS, JOÃO DE (1496-1570), called the Portuguese Livy, born at Vizeu, may be said to have been the first great historian of his country. Educated in the palace of King Manoel, he composed, at the age of 20, a romance of chivalry, the *Chronicle of the Emperor Clarimundo*, in which he is said to have had the assistance of Prince John, afterwards King John III., who gave him various important posts. In 1532 the king appointed Barros factor of the India and Mina House—positions of great responsibility and importance at a time when Lisbon was the European emporium for the trade of the East. Barros proved a good administrator, displaying great industry and disinterestedness. He made but little money where his predecessors had amassed fortunes.

At this time, John III., wishful to attract settlers to Brazil, divided it up into captaincies and gave that of Maranhão to Barros, who, associating two partners in the enterprise with himself, prepared an armada of ten vessels, carrying 900 men, which set sail in 1539. Owing to the ignorance of the pilots, the whole fleet suffered shipwreck, which entailed serious financial loss on Barros; yet not content with meeting his own obligations, he paid the debts of those who had perished in the expedition. During all these busy years he had continued his studies in his leisure hours, and shortly after the Brazilian disaster he offered to write a history of the Portuguese in India, which the king accepted. The first of the Decades of his *Asia* appeared in 1552, the Second Decade came out in 1553 and the Third in 1563, but the Fourth and final one was not published until 1615, long after the author's death (Oct. 20, 1570).

As an historian and a stylist Barros deserves the high fame he has always enjoyed. His Decades contain the early history of the Portuguese exploration and government in Asia, and is still consulted by students. Though, on the whole, impartial, Barros is the narrator and apologist of the great deeds of his countrymen, and lacks the critical spirit and intellectual acumen of Damião de Goes. Diogo do Couto continued the Decades, adding nine more. A modern *Da Asia de João de Barros, dos feitos que os Portuguezes fizeram no descubrimento e conquista dos mares e terras do Oriente* (Lisbon 1778-88) includes a life of Barros by the historian, Manoel Severim de Faria, and a copious index of all the Decades. The Decades were translated both into Italian and German.

BIBLIOGRAPHY.—The minor works of Barros are described by Innocencio da Silva: *Diccionario Bibliographico Portuguez*, vol. iii. pp. 320-323, and vol. x. pp. 187-189, and in Severim de Faria's *Life*, cited above. A compilation of Barros's *Varia* was published by the visconde de Azevedo (Porto, 1869).

BARROSA, BATTLE OF, 1811. In Feb. 1811 the garrison of Cadiz made a sortie in the hope of raising the siege (see *PENINSULAR WAR*). 10,000 Spaniards and 4,000 British under the Spaniard Lapeña sailed to Tarifa and thence marched back towards Cadiz, intending to take the besiegers in rear. Victor, the French commander, sent Villatte to block the road to Cadiz where it ran over the Bermeja peninsula. This peninsula was a strip of land three miles wide, formed by the sea on one side and the Almansa creek on the other. Across its southern or mainland end stretched the Chiclana forest and beyond this rose a low ridge, known as the Heights of Barrosa, which commanded the entrance to the peninsula. Lapeña encountered Villatte after passing through the Chiclana forest and, after a sharp fight, drove him over the Almansa creek. Sir Thomas Graham, commanding the British contingent, wished to occupy the heights of Barrosa, but Lapeña, whose one desire now was to re-enter Cadiz, peremptorily ordered him to continue his march. Graham reluctantly obeyed, but as he was passing through the forest he heard that Victor with 7,000 men was advancing from the east. Realizing the importance of the heights of Barrosa, Victor ordered Ruffin to occupy their southern extremity and Leval their northern. Graham, though he had only 4,000 men, immediately decided to recover the heights. He therefore sent Dilkes' brigade against Ruffin

and Wheatley's against Leval. In spite of a murderous fire of musketry and artillery, Dilkes' men steadily advanced on to the ridge in line, halted to pour a volley into the French masses on its crest, and charging, drove them headlong off the heights. Wheatley met with even greater success; his line, emerging from the forest, took Leval's columns by surprise and inflicted terrible losses upon them. Leval's supports fled without firing a shot and joined Ruffin's retreating division. The losses on both sides were extremely heavy, the British, out of 4,000 men, losing 1,200, and the French 2,000 out of 7,000. On a small scale it was one of the finest achievements of British arms in the war. (H. L. A.-F.)

BARROT, CAMILLE HYACINTHE ODILON (1791-1873), French politician, was born at Villefort (Lozère) on Sept. 19, 1791. He was called to the Parisian bar in 1811 and came into prominence in the revolution of July 1830, when he joined the National Guard and took an active part. As secretary of the municipal commission, which sat at the Hôtel de Ville and formed itself into a provisional government, he was charged to convey to the Chamber of Deputies a protest embodying the terms which the advanced Liberals wished to impose on the king to be elected. Louis Philippe's Government was far from satisfying his desires for reform and he persistently urged the "broadening of the bases of the monarchy," while he protested his loyalty to the dynasty. He was returned to the Chamber of Deputies for the department of Eure in 1831. In 1846 Barrot made a tour in the Near East, returning in time to take part in the preliminaries of revolution. He organized banquets of the disaffected in the various cities of France and demanded electoral reform to avoid revolution. He tried to support the regency of the duchess of Orleans in the chamber on Feb. 24, only to find it too late for half-measures. He acquiesced in the republic, and gave his adhesion to Gen. Cavaignac. He became the chief of Louis Napoleon's first ministry, in the hope of extracting Liberal measures, but was dismissed in 1840 as soon as he had served the president's purpose of avoiding open conflict. After the *coup d'état* of Dec. 1851 he was one of those who sought to accuse Napoleon of high treason, and suffered imprisonment. On the fall of the empire he was nominated by Thiers president of the Council of State. But his powers were then failing, and he had only filled his new office for about a year when he died at Bougival on Aug. 6 1873. Barrot was described by Thureau-Dangin as "le plus solennel des indécis, le plus méditatif des irréflechis, le plus heureux des ambitieux, le plus austère des courtisans de la foule."

See his *Mémoires*, edited by Duvergier de Hauranne in 1875-76.

BARROW, ISAAC (1630-1677), English mathematician and divine, was educated at Charterhouse, Felsted, and St Peter's college, Cambridge, where he studied literature, science, and philosophy. He travelled in France, Italy, and the Near East.

On his return, in 1659, to England he received ordination from Bishop Brownrig, and in 1660 he was appointed to the Greek professorship at Cambridge. In July 1662 he was elected professor of geometry in Gresham college, on the recommendation of Dr. John Wilkins, master of Trinity college and afterwards bishop of Chester; and in May 1663 he was chosen a fellow of the Royal Society, at the first election made by the council after obtaining their charter. In 1664 he became first Lucasian professor of mathematics at Cambridge, resigning in 1669 in favour of his pupil, Isaac Newton. His uncle gave him a small sinecure in Wales, and Dr. Seth Ward, bishop of Salisbury, conferred upon him a prebend in that church. In the year 1670 he was created doctor in divinity by mandate; and, upon the promotion of Dr. Pearson to the see of Chester, he was appointed to succeed him as master of Trinity college by the king's patent, Feb. 13, 1672. In 1675 Dr. Barrow was chosen vice-chancellor of the university.

By his English contemporaries Barrow was considered a mathematician second only to Newton. He was undoubtedly a clear-sighted and able mathematician, who handled admirably the severe geometrical method, and who in his *Method of Tangents* approximated to the course of reasoning by which Newton was afterwards led to the doctrine of ultimate ratios; he introduced the differential triangle, and was the first to observe explicitly the reciprocal

relation between differentiation and integration. (See INFINITESIMAL CALCULUS.) His *Sermons* have long enjoyed a high reputation; they are weighty pieces of reasoning, elaborate in construction and ponderous in style.

His scientific works are very numerous. The most important are:—*Euclid's Elements*; *Euclid's Data*; *Optical Lectures*, read in the public school of Cambridge; *Thirteen Geometrical Lectures*; *The Works of Archimedes*, the *Four Books of Apollonius's Conic Sections*, and *Theodosius's Spherics*, explained in a *New Method*; *A Lecture*, in which Archimedes' Theorems of the Sphere and Cylinder are investigated and briefly demonstrated; *Mathematical Lectures*, read in the public schools of the University of Cambridge. The above were all written in Latin. His English works have been collected and published in four volumes folio.

See Ward, *Lives of the Gresham Professors*, and Whewell's biography prefixed to the 9th vol. of Napier's edition of Barrow's *Sermons*.

BARROW, a river of south-eastern Ireland. It rises in the Slieve Bloom mountains, and flows eastward and then almost due south, to form the estuary known as Waterford harbour. Including the 12m. of the estuary, the length of its valley is rather more than 100 miles. The total area of drainage to Waterford harbour (including the basin of the Suir) is 3,500sq m., and covers the whole of the county of Kilkenny, with parts of Waterford, Cork and Limerick, Tipperary, Carlow, King's and Queen's counties.

BARROW. The origin of barrow-making is unknown. The earliest deliberate burials occurred in the Mousterian period, in caves; and although connecting links are not numerous, the natural cave must have been the ancestor of the megalithic passage-grave. In all essentials the cave and the passage-grave are the same; the "points," so to speak, of a habitation cave are (1) the ground in front of the mouth, (2) the mouth, and (3) the dark, little used interior. Of these the mouth was the most important, and was often walled off; and it is natural to suppose that the darker recesses were used for sleeping in at night. These three features correspond fairly well with the typical arrangement of a passage-grave; and if the houses of the dead were modelled upon those of the living, as is usually supposed, there may be some truth in this suggested evolution. Megalithic burial-places were very often covered with mounds of earth or, in stony country, cairns of stone; they were in fact the first barrows, so they must be considered here.

Megalithic Barrows.—There are two types of megalithic barrow—round and long. In some regions both occur side by side, and it is supposed that they represent the circular and rectangular type of hut respectively. The three classic examples of megalithic round barrows are Gavr Inis, Brittany; New Grange, Ireland (fig. 1); and Maes Howe in Orkney. The mound of Houge Bie in Jersey belongs to the same class. In essential plan these are all identical—a huge mound covering a long flagged passage, leading to a central, or nearly central cruciform chamber; the whole mound being sometimes surrounded by a circle of stones or a ditch. There are no examples of this type in England, except possibly, in a degenerate form, in Cornwall and (more doubtfully) in Derbyshire.

Long Barrows.—The long type is called a long barrow or long cairn. Its varieties are numerous. It may be a simple mound of earth, as in Wessex, or a cairn covering stone burial-chambers, as in Oxfordshire and the Cotswolds. It has different names in foreign lands; but the navetas of Minorca, the Giants' tombs of Sardinia, and the long, rock-cut tombs so common in Mediterranean lands are all varieties of the same species. Like the round ones these long tombs were intended for collective burial. At Belas Knap, a long barrow near Cheltenham, there is a strong hint of human sacrifice; and the remains of purificatory fires were found within the cairn. Tribute was paid to Weland, the invisible smith of the Berkshire downs, nearly two thousand

years after the burial-place was built; and the custom of leaving twopence there for a horse to be shod survived down to within living memory.

Long barrows are of earth and stone. Those of earth probably had wooden chambers. At Worbarrow, excavated in 1893 by Gen. Pitt-Rivers, remains of wooden posts were found inside the barrow. The substitution of earth and wood was due to the absence

FROM OVERY, "SURVEY OF WAYLAND'S SMITHY" (SOCIETY OF ANTIQUARIES, LONDON)

FIG 2 —WAYLAND'S SMITHY, BERKS

of suitable stone for building chambers. Wherever such stone was present it was used. In some cases it was even transported several miles. In the celebrated West Kennet long barrow near Avebury, the chambers are of sarsens or grey wethers, but the interstices between them were filled up by flat oolitic slates brought there from near Calne—that is the nearest outcrop, at any rate—seven miles away, and oolitic chips can be picked up on the surface of an unexcavated long barrow on Horton down, two miles to the south-west. In Wiltshire there are about a hundred altogether; elsewhere they are less abundant, but there are many in Hampshire and Dorset, a few in Cornwall, Somerset, Yorkshire, Kent and Sussex, and at least three in Lincolnshire.

Three types of chambered long barrows may be distinguished. At first the entrance was made in the east end, and through a portal consisting of two upright stones and a lintel. Through this one went along a narrow passage between uprights, and on either side of the passage were the burial chambers. The whole was covered in by a mound of earth and stones. To this type belong Wayland's smithy in Berks (fig. 2), several of the Somerset long barrows, and in Gloucestershire Hetty Pegler's Tump at Uley and the Nympsfield barrow close by. Later the burial chambers were entered by a passage opening in the side of the barrow; but a dummy portal was still placed at the east end, leading nowhere. Most of the Cotswold long barrows are of this later "false passage-grave" type exemplified in fig. 3. Finally, as in the St. Nicholas long barrow, the side chambers degenerated into mere cists without entrances. The long barrows of Brecknockshire belong, for the most part, to this late stage.

The makers of long barrows belonged to the Mediterranean race. The evidence of long barrow skulls is quite consistent. This burial custom continued until the invasion of the beaker-folk, but one must not imagine that the Mediterranean natives stopped making long barrows the moment the beaker-folk landed.

Bell Barrows.—The beaker-folk specialized in round barrows, of which there are many kinds. One form, the bell barrow, consists of a large mound with a ditch round it. Between the foot of the mound and the ditch there is left a narrow shelf or berm of natural ground, and round the outside of the ditch a small bank is cast up. The whole has the appearance of a bell—hence the name, invented by Colt Hoare.

All bell barrows belong to the early part of the bronze age. They are very common in Wiltshire, and some of them have yielded rich burial goods of gold and bronze. A pit, roughly circular, was first dug in the chalk; the corpse was then placed in it with the grave-goods. A mound of earth was piled on the top, and last of all a shallow ditch was dug round and the contents thrown up over the skirt of the mound. The digging of the ditch was probably a ritual performance, for in the case of certain barrows (which seem to belong to an earlier date) the ditch was much deeper and very irregularly dug, having originally served a practical purpose—that of a quarry for obtaining the material of the mound. The material of which earthen long barrows were made was certainly derived from the side ditches which flank it.

This question of the method of construction, though impor-

FROM LOFFET, "NEW GRANGE" (ROYAL IRISH ACADEMY)

FIG. 1.—PLAN OF CHAMBERED ROUND BARROW AT NEW GRANGE, NEAR DROGHEDA, IRELAND

tant, has been little studied. A shallow ritual ditch may easily survive, but it is less easy to see why any change at all should have taken place. In a late bell barrow, at Roundwood in Hampshire, the material of the mound consisted entirely of scraped-up soil, dark in colour, such as would be obtained from the surface of a ploughed field. If during the long-barrow period there were few cultivated fields, and if later they became very common, it might be found easier to obtain the material by scraping up soil than by laboriously quarrying the hard chalk. However, so far as superficial observation goes, a great many round barrows seem to be made entirely of quarried chalk.

Disk Barrows.—The ritual ditch reached its highest development in the disk barrow, which consists of a ditch, nearly always perfectly circular, with a bank generally on its outer side, surrounding a platform of bare level ground. In the centre is a small, low mound of earth, covering (in every recorded instance) an interment of burnt bones. In no instance has a primary inhumation been found in a disk barrow. The diameter of disk barrows varies, but normally it is about 150 feet. There are two types of disk barrows, both more or less contemporary. Sometimes, in the commonest type of disk barrow, there is more than one central mound.

The disk barrows belong exclusively to the early part of the bronze age. They are thus roughly contemporary with bell barrows; but in bell barrows there have been found both beakers and copper knives. These objects are characteristic of the very earliest phase, and as they have never been found in a disk barrow it is reasonable to infer that disk barrows did not come into fashion until later. The fact, too, that the burials in them are invariably cremated points in the same direction.

In at least 25 cases certain ribbed beads of glass or faience have been found associated with early bronze age burials. The age and provenance of these beads is disputed. Sir Flinders Petrie, Professor Sayce, and Dr. Hall regarded them as Egyptian, but Sir Arthur Evans has suggested that they may have come from Crete. Opinions differ also with regard to their age. The dates mentioned by Sir Arthur Evans all fall between 1600 and 1100 B.C., and this covers the dates suggested by others and 1400 to 1200 B.C. would appear to be a central date, and one in agreement with the opinions of Egyptologists. The matter is of prime importance for British prehistoric chronology; and since out of the 25 separate instances where the beads have been found no less than five were in disk barrows, it may be concluded firstly, that all normal disk barrows are contemporary, and secondly that their date falls round about 1400-1200 B.C.

The beads in question are sometimes referred to as the "Stonehenge beads." But the only reason for associating them with Stonehenge is that they have been found in two separate barrows near Stonehenge. That, of course, proves nothing. It is quite usual to find regimental buttons and empty cartridge-cases in the same barrows, but this does not prove that Stonehenge was built by the British army.

The burials in disk barrows are supposed, from the nature of the grave-goods—the supposition is not necessarily correct—to have been the burial-places of women. We may, if we like, associate this fact with the supposed matriarchy of the Picts. The disk barrow was certainly an elaborate kind of burial-place, likely to have been used only for important people.

Twin Barrows.—Contemporary with disk barrows are twin barrows, which consist of two mounds with but a single ditch.

It has been suggested that these are the burial-places of a man and his wife. There is no evidence to disprove this and it seems not unlikely. Sometimes, however, *three* mounds are included within the ditch. Triple barrows are less common—and do not necessarily disprove the husband and wife hypothesis.

Elsewhere in stony countries, instead of digging a pit, they made a cist of four slabs of stone; and instead of a ditch they

FROM THE "TRANSACTIONS" (ESSEX ARCHAEOLOGICAL SOCIETY)

FIG. 4.—SECTION OF TOMB IN ROMAN BARROW ON MERSEA ISLAND

surrounded the mound with a ring of upright stones. Sometimes the ring of stones was there without the mound. That stone circles were invariably burial-places would be hard to prove; exhaustive excavation of all or nearly all such circles could alone achieve it. But in all cases where such excavation has been undertaken, some remains of a burial have been found in the centre; and one may conclude that, even if they served some additional object, their primary purpose was sepulchral.

As in countries where stone is available it was used for the tomb itself and the surrounding enclosure, so the disk barrow was perhaps merely an attempt to reproduce the stone circle in a stoneless country. A burial-pit is certainly a substitute—the only possible one—for a stone cist; for even in Wiltshire, in the regions where sarsen stones occur, stone cists were actually made. Thus near Avebury several sarsen-cists have been found, some of them containing beakers. Moreover, the usual ring of stones surrounds the barrow too. Stony countries are the rule, and stoneless ones, like most of Wessex, the exception, in western Europe; and England was almost the first stoneless country that the beaker-people had met with in their wanderings. In those parts of England where stone occurs they would follow their usual practice; and in others they would conform as closely to it as the altered conditions permitted.

Of the burial customs that obtained in England between about 1200 and about 600 B.C. we know very little. Probably many cremation barrows belong to this period. Towards the close of the period, if not before, began those invasions of Continental tribes bringing with them, like their "beaker" predecessors, the knowledge of a new metal—iron. At least four different varieties of pottery may be associated with the tribes which took part in this invasion; though not all these varieties are necessarily contemporary. Barrows were not invariably thrown up over the cremations; it was a common practice to dig a hole in an existing barrow and put the cinerary urn with the bones in it. Several barrows, made at an earlier date perhaps, have been found thus "potted." One found in 1925 on Woodminton down in south Wilts contained 28 burials in urns, all more or less fragmentary, only eight being capable of complete restoration.

Urn-fields.—Urn-fields were an alternative method of disposing of the dead. Sometimes they were near barrows—Gen. Pitt-Rivers found a small one on Handley hill, Dorset, near his Barrow 24. It consisted of 52 pits, each containing burnt bones, and in 47 cases there was an urn as well. The pottery used for this purpose, here and elsewhere, is generally of the finger-tip type, which is coarse and contains a large admixture of pounded flint grit. It is very friable and is the despair of pot-menders. Urn-fields also occur in the Lower Thames basin; the urns from one at Ashford in Middlesex are in the British Museum.

The finger-tip people invaded Yorkshire, for their pottery has recently been found at Scarborough on the site where later the

FROM THURNAN, "CRANIA BRITANNICA"

Romans built a signal station. A still later wave of invaders built barrows—the only iron age barrows known in this country. They are called the Danes' graves and some, still to be seen in a small copse near Driffield in the East Riding, contained remains characteristic of the first La Tène period (500–300 B.C.). The barrows are quite small and are placed close together.

The later iron age people, whom Caesar found here, buried in urn-fields, the most celebrated being those at Aylesford and

FIG. 5.—BARROW IN CRANBORNE CHASE, DORSET, WITH IRREGULAR DITCH

Swarling in Kent. It is possible that mounds covered these interments and were ploughed away, but there is no such evidence.

Roman Barrows.—The Romans occasionally buried in barrows, particularly in the east of England. Roman barrows are peculiar on account of their steep, conical outline. Six—called the Six Hills—occur at Stevenage in Hertfordshire, and there is another at Youngbury in the same county. The Bartlow hills in Essex are similar, and yielded beautiful enamelled casquets and other objects. There is another on Mersea island, Essex. Sometimes these barrows contain a brick chamber, and the burnt remains are generally in a beautiful jar of green glass. A fine Roman interment, once possibly covered by a barrow, was found at Radnage, near Bledisloe in the Chilterns. The contents are in the British Museum.

One class of mound sometimes called a barrow, seldom, if ever, yields an interment. It consists of a low, flat rectangular mound rather like a pillow; there is often a longitudinal crease down the middle, and sometimes grooves or creases at right angles to and on either side of the central one. These mounds often occur near and within hill-top camps, but may be of more recent date. One of the best groups is that on Steeple Langford Cowdown, near Yarnbury in Wiltshire. No satisfactory explanation of the purpose of these mounds has ever been put forward. It has been suggested that they are artificial rabbit warrens, but such temptations to burrow seem rather superfluous. One such in Hollybush camp on the Malvern hills has been twice excavated without providing a solution of the problem.

Saxon Barrows.—The Saxons certainly made barrows, and the best example near Oxford is the Asthall barrow. It is a very big mound and the interment was by cremation, so that the valuable grave-goods were much damaged. No doubt such burial was reserved for important people, then as in earlier times, for the usual method of burial during the period was either in flat cemeteries or as secondary interments in prehistoric barrows. It is quite common to find these secondary interments in all the prehistoric

barrows described; they are generally at no great depth in the body of the mound. Such remains have been found in Wiltshire in disk barrows as well as in more bulky mounds, and in that county they are much more common than flat cemeteries. In the Cotswolds secondary interments of the Anglo-Saxon period have been found in the long barrows at Swell, Crawley and Lyneham.

On the Berkshire downs is a gigantic mound called now Scutchamer Knob, which is the modern form of *Cwichelmes-hlew*. It is two miles from West Ilsley, but is best approached from West Hendred and Ginge on the north. This mound is mentioned in the Anglo-Saxon Chronicle under the year 1086, where it is said that the Danes went along Ashdown, that is to say along the Ridgeway, to Cwichelmes-hlew. It was probably the burial-mound of Cwichelm, the first king of Wessex. A similar mound may have existed at Challow, near Wantage—the hill of Ceawa.

A celebrated find of gold jewellery was made in a barrow in Taplow churchyard. It is probable that this barrow was of Anglo-Saxon construction, for the name of Taplow originally signified the hill of Tacpa, and by analogy we may conclude that by his "hill" was meant his barrow. (The difference in connotation between *beorh*, barrow, and *hlaew*, hill, is unknown, but *hlaew* may have meant a *big* hill, both natural and artificial.)

In Kent are a number of Saxon barrows. Like the Danes' graves, they occur in large numbers, set close together, and are small. There is a group in Greenwich park and another on Barham downs. Both groups contained burials of the pre-Christian period (A.D. 450–600). Mounds might have been visible over the graves in some of the other so-called "flat" cemeteries, did not these nearly always occur on ploughed land. These small mounds would rapidly disappear by ploughing, and the site of the Saxon settlement being generally the same as that of the mediaeval and

FIG. 6.—PLAN OF BARROW NO. 23, HANDLEY HILL, DORSET, EXCAVATED IN AUGUST, 1893

modern village, the site of the earlier cemetery was nearly always included within the common fields of the township.

Castle Mounds.—Castle mounds, which are often mistaken for barrows, usually have a courtyard or bailey attached, the pair resembling a loaf of bread in plan. In one instance, in Wales, a mound served both purposes, being used as a castle mound and containing in its centre a stone cist with a prehistoric burial. The tops of castle mounds were fortified by a wooden keep or castle, or by a stone wall, whose hard foundations may sometimes be detected round the rim. The centre is sometimes hollow, and there is generally a deep, wide moat, with a causeway for the entrance. If the mound is a barrow, the surrounding ditch is not, as a rule, so big.

BARROW-IN-FURNESS, municipal, county and parliamentary borough, Lancashire, England, 264½ m. N.W. by N. from London, on the L.M.S. railway. Pop. (1891) 51,712; (1921) 74,244. It lies on the seaward side of the peninsula forming part of the district of Furness, between the estuary of the Duddon and Morecambe Bay, where a narrow channel intervenes between the mainland and the long low island of Walney. Barrow is of rapid modern growth through the working of veins of pure haematite iron ore in the district of Furness (*q.v.*). At the outset Barrow merely exported the ore to the furnaces of South Wales and the midlands. At the beginning of the 19th century this export amounted at most to a few thousand tons, and though it had reached some 50,000 in 1847 the population of Barrow was only 325. In 1846 the first section of the Furness railway was opened, connecting Barrow with the mines near Dalton; in the ensuing years a great increase in trade justified the opening of further communications, and in 1859 the ironworks of Messrs. Schneider & Hannay were instituted. The Barrow Haematite Steel Company (1866) absorbed this company, and a great output of steel produced by the Bessemer process was begun. Other industries followed. Of these the shipbuilding works have surpassed the steel works in importance, the celebrated firm of Vickers, Sons & Maxim having a yard where they construct war vessels and others. There are also a petroleum storage establishment, a paper-pulp factory, and engineering and wagon works with tool and boiler making a speciality.

The docks in the strait between Barrow Island and the mainland were constructed in 1867. The Ramsden docks are a subsequent extension. There is also a graving dock. Passenger steamers run to Belfast. The shipbuilding yards developed greatly during the World War and war vessels of all types were constructed.

The Cavendish dock adjoining the Ramsden dock on the east has been leased to the firm of Vickers, Ltd., for the construction of airship sheds. The airship factory is on Walney Island, which is connected with the mainland by a bridge with an opening span of 120 ft., for the passage of vessels. Further, electrical power is now obtained by works on the Leven river at Backbarrow near Lake Windermere for Barrow and other towns. The town is laid out in rectangular form and has many public buildings. A Carnegie library was opened in 1922. Vickerstown, on Walney Island, is becoming increasingly a residential suburb of Barrow. The James Dunn park is on the east, and the Biggar Bank, a public recreation ground facing the Irish Sea, on the west side of the island. The town was incorporated in 1867 and became a county borough in 1888. The corporation consists of a mayor, eight aldermen and 24 councillors. Area 11,002 acres with 1,311 of water and 10,385 of foreshore.

BARROWE, HENRY (1550?-1593), English Puritan and Separatist, was born about 1550, at Shipdam, Norfolk. He graduated from Clare hall, Cambridge, in 1569-70. About 1580 or 1581 he retired to the country, and was led by study to the strictest form of Puritanism. He came into intimate relations with John Greenwood, the Separatist leader, whose views (probably due in part at least to Browne's influence) he adopted without reserve. He was associate with "the brethren of the Separation" in London at this time. Greenwood having been imprisoned in the Clink, Barrowe came from the country to visit him, and on Nov. 19, 1586, was detained by the goaler at the instigation of Archbishop Whitgift. After nearly six months' irregular detention he and Greenwood were formally indicted (May 1587) for recusancy. They were ordered to find heavy bail for conformity, and they remained in prison for the rest of their lives. During his imprisonments he was engaged in written controversy with Robert Browne (down to 1588). He also wrote treatises in defence of separatism and congregational independency, the most important being:—*A True Description of the Visible Congregation of the Saints, etc.* (1589); *A Plain Refutation of Mr. Gifford's Booke, intituled A Short Treatise Gainst the Donatistes of England* (1590-91), and *A Brief Discovery of the False Church* (1590). In 1590 it was resolved to proceed on a capital charge of "devising and circulating seditious books." They were tried and sentenced to death on March 23, 1593. They were hanged early on the morning of April 6.

The opinions of Browne and Barrowe had much in common, but were not identical. Both advocated congregational independency. But the ideal of Browne was a spiritual democracy, towards which separation was only a means. Barrowe, on the other hand, regarded the whole established church order as polluted by the relics of Roman Catholicism, and insisted on separation as essential to pure worship and discipline (*see* further CONGREGATIONALISM).

BIBLIOGRAPHY.—H. M. Dexter, *The Congregationalism of the Last Three Hundred Years*; F. J. Powicke, *Henry Barrowe and the Exiled Church*. *See* also B. Brook, *Lives of the Puritans*; and Cooper, *Athenae Cantabrigienses* vol. ii. (1861).

BARRY, SIR CHARLES (1795-1860), English architect, was born in London on May 23 1795, the son of a stationer. He was articled to a firm of architects till 1817, when he set out on a three years' tour in Greece and Italy, Egypt and Palestine to study architecture. In 1820 he settled in London. One of his first works was the church of St. Peter at Brighton, in 1826. In 1831 he completed the Travellers' club in Pall Mall, a splendid work in the Italian style and the first of its kind built in London. In the same style and on a grander scale he built in 1837 the Reform club. He was also engaged on numerous private mansions in London, the finest being Bridgewater house (1847). Birmingham possesses one of his best works in King Edward's school which he built in the Tudor style between 1833 and

1836. For Manchester he designed the Royal Institution of Fine Arts (1824) and the Athenaeum (1836), and for Halifax the town hall. He was engaged for some years in reconstructing the Treasury buildings, Whitehall. But his masterpiece, notwithstanding all unfavourable criticism, is the houses of parliament at Westminster (1840-60). Barry was elected A.R.A. in 1840 and R.A. in the following year, and received many foreign honours. He was knighted in 1852. He died suddenly at Clapham, London, on May 12 1860, and was buried in Westminster Abbey. In 1867 appeared a life of him by his son Bishop Alfred Barry (1826-1910). See H. H. Statham, *The Architectural Genius of Sir C Barry* (1901).

His son, EDWARD MIDDLETON BARRY (1830-1880), was also an architect, and was professor of architecture at the Royal Academy from 1873 until his death. He completed his father's work on the houses of parliament at Westminster, and Halifax town hall. Other buildings designed by him were Covent Garden theatre, Charing Cross and Cannon Street hotels, the Birmingham and Midland Institute, new galleries for the National Gallery and new chambers for the Inner Temple.

The youngest son, SIR JOHN WOLFE WOLFE-BARRY (1836-1918), civil engineer, who assumed the additional name of Wolfe in 1898, was educated at Glenalmond, and articled as engineering pupil to Sir John Hawkshaw, with whom he built the railway bridges across the Thames at Charing Cross and Cannon street. In 1867 he worked on his own account. Among the works on which he was engaged were extensions of the Metropolitan District railway, the St. Paul's station and bridge of the London, Chatham and Dover railway, the Barry Docks of the Barry railway company near Cardiff, the lock entrance, dock and graving dock at Immingham, Grimsby, the extensions of the Surrey Commercial docks on the Thames, the Tower and new Kew bridges over the Thames. On the completion of the Tower bridge, in 1894, he was made a C.B., becoming K.C.B. three years later. Wolfe-Barry served on a number of important royal commissions, notably on that on London Traffic (1903-05), and 1892-1906 was one of the two British representatives on the International Suez commission. He led in promoting (1901-02) the Engineering Standards committee for the standardization of certain engineering products. He died at Chelsea on Jan 29 1918.

BARRY, SIR REDMOND (1813-1880), British colonial judge, son of Maj.-Gen. H. G. Barry, of Ballyclough, Co. Cork, educated at a military school in Kent, and at Trinity college, Dublin, was called to the Irish bar in 1838, and emigrated to Australia. After practising for some years at Melbourne he became commissioner of the court of requests, and on the creation in 1851 of the colony of Victoria, was its first solicitor-general. Later he was judge of the supreme court, acting chief-justice and administrator of the Government. He was knighted in 1860, and was created K.C.M.G. in 1877. He founded the University of Melbourne (1853), and was its first chancellor.

BARRY, ELIZABETH (1658-1713), English actress. At first she was unsuccessful on the stage; but she was coached by her lover the earl of Rochester. Her performance as Isabella, queen of Hungary, in the earl of Orrery's *Mustapha*, was said to have caused Charles II. and the duke and duchess of York so much delight that the duchess took lessons in English from her, and when she became queen she gave Mrs Barry her coronation robes in which to appear as Elizabeth. Mrs. Barry is said to have created over 100 parts. Betterton says that her acting gave "success to plays that would disgust the most patient reader." Dryden pronounced her "always excellent." Cibber is authority for the statement that it was on her behalf that benefits were first established for actors by command of James II. In 1709 she retired from the stage and died on Nov 7 1713.

BARRY, JAMES (1741-1806), British painter, was born at Cork on Oct. 11, 1741. His picture of the "Conversion by St. Patrick of the King at Cashel" (1763) brought him the acquaintance and friendship of Edmund Burke, who, with other friends, sent him abroad to study art. In 1773 he was elected R.A., and he exhibited pictures on classical and historical subjects in the Academy year by year until 1776. Of these the most famous is

the "Death of General Wolfe," familiar through numerous engravings. The reason why he ceased to exhibit at the Academy seems to have been annoyance at the reception of this picture. He was expelled from the Academy in 1799 on account of his *Letter to the Dilettanti Society*, which expressed a good deal of contempt for his contemporaries. In 1773 he published *An Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England*, vindicating the capacity of the English for the fine arts and indicating some of the circumstances which had prevented their progress. In 1777 he agreed to decorate the interior of the hall of the Society of Arts in the Adelphi, a task which occupied him for seven years.

Barry died on Feb. 22 1806. By his irascible temper and his frequent attacks on other artists he made many enemies. Nevertheless Burke never seems to have failed him, and Sir Joshua Reynolds, on whom his most violent attacks had been made, forgave him. But Barry outlived these friends, and the last years of his life were spent in rather gloomy solitude at his house off Oxford Street, London.

BARRY, JOHN (1745-1803), an Irish-American naval officer, was born in Tacumshane, Co Wexford, Ireland, in 1745. He went to sea as a boy and thus got to Philadelphia. He eventually became master of a vessel there and acquired a fortune. When the Revolution began he volunteered for service and was put in command of the "Lexington." With this ship in 1776, he captured the "Edward"—the first British naval vessel taken by the Americans. Then he commanded the "Effingham" and, for a time, served in the land forces at Trenton. During this period he took one British ship, but lost the "Effingham" and, in 1778, the "Raleigh" also. In 1781 he took Col. Lauren's mission to France in the "Alliance" and later, with the same ship, captured the "Trepassy" and the "Atalanta." He was wounded in this engagement but made another voyage to France with Lafayette and Noailles. In 1794 he was appointed commodore and built and commanded the frigate "United States." He died in Philadelphia on Sept. 13, 1803.

See Barry's report of the capture of the "Edward" in the *Pennsylvania Gazette* of April 17, 1776, J. Frost, *Am. Naval Biog* (Phil, 1844), M. T. J. Griffin, *The History of Commodore John Barry* (Phil, 1897); *ib.*, "John Barry and not Paul Jones the Founder of the Am. Navy" in *Am Cath Hist Soc Rev*, new ser 1 (1905) pp. 214-219; Joseph Taggart, *Biog Sketches of eminent Am Patriots* (Kansas City, 1907); and W. B. Meany, *Commodore John Barry, the Father of the Am. Navy* (1911).

BARRY, SPRANGER (1719-1777), British actor, was born in Dublin, on Nov 23 1719, the son of a silversmith. His first London appearance was made in 1746 as Othello at Drury Lane Theatre. In *Hamlet* and *Macbeth* he alternated with Garrick, arousing the latter's jealousy by his success as Romeo. This resulted in his leaving Drury Lane for Covent Garden Theatre in 1750, accompanied by Mrs. Cibber, his Juliet. Both houses now at once put on *Romeo and Juliet* and Barry's impersonation was preferred by the critics to Garrick's. In 1758 Barry built the Crow Street Theatre, Dublin, and later a new theatre in Cork, but he was not successful as a manager and returned to London to play at the Haymarket Theatre, then under the management of Foote. As his second wife, he married in 1768 the actress, Mrs. Dancer (1734-1801), and he and Mrs Barry played under Garrick's management. In 1774 they both moved to Covent Garden, where Barry remained until his death, which occurred on Jan. 10 1777.

His second wife, ANN STREET BARRY, was born in Bath in 1734. Early in life she married an actor of the name of Dancer, and it was as Mrs. Dancer that she made her first recorded appearance in 1758 as Cordelia to Spranger Barry's *Lear* at the Crow Street Theatre. It was not until she came to Drury Lane with Barry that her reputation advanced to the high point at which it afterwards stood. After his death, she remained at Covent Garden and married a man named Crawford. Her last appearance is said to have been as Lady Randolph in *Douglas*, at Covent Garden, in 1798. In this part, and that of Desdemona she was considered by some critics superior to Mrs. Siddons. She died on Nov. 29 1801, and was buried in Westminster Abbey.

BARRY, urban district, Glamorganshire, Wales, 8 m. S.W. from Cardiff on the Bristol Channel. The population in 1921 was 38,945. A small brook named Barri runs here into the sea, whence the place was formerly known in Welsh as Aber-Barri; but the name of both the river and the island is supposed to be derived from Baruch, a Welsh saint of the 7th century, who had a cell on the island. His chapel, which still existed in Leland's time, was a place of pilgrimage in the middle ages. One of the followers of Fitzhamon, about the end of the 11th century, built a castle at Barry, of which only a gateway remains.

Barry comprises the ecclesiastical parishes of Barry, Cadoxton, Merthyr-Dovan, and a portion of Sully in which is included Barry Island (194 ac.), now, however, artificially joined to the mainland. The total population of this area in 1881 was only about 500, that of Barry village alone being only 85. The enormous increase in the population of nearly 40,000 in 40 years was entirely brought about by coal exporting during the last quarter of the 19th century. The great demand for steam coal at that time gave opportunities for a number of colliery owners to secure an alternative port to Cardiff, with an independent railway to it from the coal-fields. After failing in 1883, they obtained parliamentary powers for this purpose in 1884, and the first sod of the new dock at Barry was cut in November of that year. The docks are 114 ac. in extent, and have accommodation for the largest vessels afloat. Further docks were built in 1889 and 1898.

As a great coal-exporting town it had railway connexions with the Rhondda valley by the Barry railway, with Aberdare and Merthyr by the junction of the Barry and Taff Vale at Treforest, and with the Great Western Railway main line at St. Fagans. There are also connexions with the Rhymney, Brecon and Merthyr, and Vale of Glamorgan railways and the London, Midland and Scottish. All the smaller lines are now incorporated with the Great Western Railway. After 1918, in particular, Barry, together with "Barry Island," became a favourite resort for the mining valleys—a development which has increased with modern motor transport. There is a women's training college which draws most of its students from the industrial valleys. Barry is included in the Llandaff and Barry Parliamentary division of Glamorganshire.

BARRY, a term in heraldry for a transverse division of the shield into equal partitions; this is termed "barry of six (eight or ten) pieces," according to the number of the divisions. The term *barry-bendy* is used when the transverse lines (barways) are crossed by vertical lines (bendways).

BARRYMORE, ETHEL (1879—), American actress, was born on Aug. 15, 1879 in Philadelphia (Pa.), and was educated at the convent of Notre Dame in that city. She made her début in 1896 in the company of her uncle, John Drew. In 1897 she first appeared in England in *Secret Service*, and in 1898 with Sir Henry Irving's company in *The Bells* and *Peter the Great*. She was first starred by Charles Frohman in *Captain Jinks* in 1900, and became one of the leading actresses in the United States, appearing in, among other plays, *A Doll's House* (1905), *Alice-Sit-by-the-Fire* (1906), *Captain Jinks* (1907), *Mid-Channel* (1910), *Declassé* (1922), *The Second Mrs. Tanqueray* (1924), *Hamlet* and *The Merchant of Venice* (1925-26), and *The Constant Wife* (1926).

Her brother JOHN BARRYMORE (1882—), first appeared on the stage in *Magda* in 1903. He appeared in *The Jest* (1919), *Richard III.* (1920), and *Hamlet* (1923). He repeated *Hamlet* at the Haymarket Theatre, London (1925). He also achieved success as a film actor.

Another brother, LIONEL BARRYMORE (1878—), made his first appearance in 1893 in *The Rivals*, his grandmother, Mrs. John Drew, taking the part of Mrs. Malaprop, and he has had a successful career on both stage and screen.

BAR-ŞALIBĪ, JACOB or **DIONYSIUS**, the best-known and most voluminous writer in the Syrian Jacobite church of the 12th century. (Jacob was his baptismal name; Dionysius he assumed when consecrated to the bishopric.) Like Bar-Hebraeus, he was a native of Malatia on the Upper Euphrates. In 1154 he was created bishop of Mar'ash by the patriarch Athanasius VIII.;

a year later the diocese of Mabbōg was added to his charge. In 1166 Michael I., the successor of Athanasius, transferred him to the metropolitan see of Amid in Mesopotamia, and there he remained till his death in 1171. A long account of his writings, with copious extracts from some of them, has been given by Assemani (*Bibl. Orient.* ii. pp. 156-211); see also W. Wright (*Syriac Literature*, pp. 246-50). His commentaries on the Gospels were used by Dudley Loftus in the 17th century.

BARSI, a town of British India, in the Sholapur district of Bombay, lying within a tract entirely surrounded by the Nizam's dominions. Pop. (1921) 22,074. Barsi is a flourishing centre of trade, exporting to Bombay large quantities of cotton and oil-seeds. There are oil and cotton mills. It is connected with the main line of the Great Indian Peninsula railway by a light railway.

BAR SINISTER, a phrase used for a charge in heraldry denoting bastardy; ignorantly used, for heraldry knows nothing of a bar sinister. It is one of the words of Sir Walter Scott, who had many imitators. More cautious writers speak of a bend sinister, a charge as strange to mediaeval English heraldry, which has, indeed, no piece set apart to signify bastard descent, although the later heralds have been wont to mark the bastard's arms with a *bâton sinister coupé*. This charge seems now out of fashion, a wavy border having taken its place.

BAR-SUR-AUBE, a town of France, capital of an arrondissement, department of Aube, 34m. E. by S. of Troyes on the railway between that town and Belfort. Pop. (1926), 4,173. Bar-sur-Aube lies at the foot of hills on the right bank of the Aube at its confluence with the Bresse. Traces of a Roman settlement have been found to the south of the town. Under the counts of Champagne it had important fairs which did not cease till 1648. During the Napoleonic wars several actions took place here. Boulevards occupy the site of the old ramparts. The churches of St. Pierre and St. Maclou both date mainly from the end of the 12th century—St. Pierre has wooden exterior galleries and two fine Gothic porches. The wine of the district is of some repute, and there is an annual wool fair. The town is the seat of a sub-prefect and has a tribunal of first instance.

BAR-SUR-SEINE, a town of France, department of Aube, on the left bank of the Seine, 20m. S.E. of Troyes by the Eastern railway. Pop. (1926) 2,457. The town lies under a hill crowned by ruins of the castle of the counts of Bar, and consists chiefly of one long street. Devastated in 1359 by the English, when, according to Froissart, no fewer than 900 mansions were burnt, it also suffered greatly in the religious wars of the 16th century. The church of St. Étienne of the 16th and 17th centuries contains some fine stained glass. Bar-sur-Seine has a tribunal of first instance. Wood-sawing is carried on, and there is trade in wine and wood, and in the products of paper-mills and tanneries. The Canal de la Haute-Seine begins here.

BART, JEAN (1651-1702), French admiral, the son of a fisherman, saw his first service with the Dutch Navy, but on the outbreak of the war with France, entered the French naval service. Louis XIV., hearing of his exploits against the pirates of the North Sea, made him captain of a frigate in 1686. He had resource, wit, and a navigating skill which made him a terror to English commerce during the wars between Louis XIV. and William III. In 1689 he forced his way through the Anglo-Dutch cruisers carrying a cargo of ammunition from Calais to Brest; in the same year he was imprisoned at Plymouth, from whence he escaped with four others, crossing to St. Malo in a yawl. In 1692 he made a daring descent on the coast of England, burning several merchant ships on the way. He is one of the heroes of the French Navy, and his native town of Dunkirk has a square named after him.

See A. Richer, *Vie de Jean Bart*, (Epinal, 1837); H. Malo, *Les Corsaires*, (1912).

BARTELS, HANS VON (1856-1913), German painter, was born in Hamburg, the son of Dr. N. F. F. von Bartels, a Russian government official. He studied under the marine painter R. Hardorff in Hamburg, under C. Schweitzer in Düsseldorf and C. Oesterley in Hamburg, and at the Berlin School of Art. After some time spent in travel he settled in Munich in 1885 and was

appointed professor of painting in 1891. An oil painter of great power, Bartels was one of the leading German water-colour painters, his work consisting mainly of seascapes and scenes of fishing life. He excels in storm scenes and in depicting the strong, healthy fishing-folk of the northern coasts. Among his principal works are: "Sturmflut" (Berlin Gallery); "Lonely Beach" (Hungarian National Gallery); "Potato Harvest-Rügen" (Prague); "Storm—Bornholm" (German emperor's collection); and "Moonlight on the Zuyder Zee" (New Pinakothek, Munich). He died at Munich on Oct. 5, 1913.

BARTENSTEIN, a town in the Königsberg district of East Prussia, at the junction of the Königsberg—Lyck railway with branches from north-east and south-west. Pop. (1925) 7,881. It is an agricultural centre with some wool-spinning.

BARTER, the term used to describe the direct exchange of commodities without the use of a medium of exchange. Barter still exists in the interior of Africa and of South America. Barter from Fr. *barater*, to exchange, to truck, reminds us that, however the processes of exchange may be disguised by the immediate translation of goods into money or money into goods, all trade essentially remains barter. Moreover, if direct barter has its obvious imperfections, the indirect barter which consists in buying or selling for money has also its imperfections. (See MONEY; BANKING AND CREDIT; TRADE, PRIMITIVE.)

BARTET (REGNAULT), **JEANNE JULIA** (1854-), French actress, was born in Paris and trained at the Conservatoire. In 1872 she began a successful career at the Vaudeville, and in 1879 was engaged at the Comédie Française, of which she became a *sociétaire* in 1880. For many years she played the chief parts both in tragedy and comedy, her grand style and exquisite finesse making her supreme among the younger actresses on the French stage. She had a season in London in 1908. She made her farewell to the stage on Jan. 21, 1920.

BARTH, HEINRICH (1821-1865), German explorer, was born at Hamburg on Feb. 16 1821, and educated at Berlin university, where he graduated in 1844. He had already visited Italy and Sicily and had formed a plan to journey through the Mediterranean countries. After studying Arabic in London he set out on his travels in 1845. From Tangier he made his way overland throughout the length of north Africa, visiting the sites of the ancient cities of Barbary and Cyrenaica. He also travelled through Egypt, ascending the Nile to Wadi Halfa and crossing the desert to Berenice. While in Egypt he was attacked and wounded by robbers. Crossing the Sinai peninsula he traversed Palestine, Syria, Asia Minor, Turkey and Greece, everywhere examining the remains of antiquity; and returned to Berlin in 1847. For a time he was engaged there as *Privatdozent*, and in preparing for publication the narrative of his *Wanderungen durch die Küstenländer des Mittelmeeres*, which appeared in 1849.

At the instance of Bunsen and other scientists, Barth and Adolf Overweg, a Prussian astronomer, were appointed colleagues of James Richardson, an explorer of the Sahara who had been selected by the British government to open up commercial relations with the states of the central and western Sudan. The party left Tripoli early in 1850, but the deaths of Richardson (March, 1851) and Overweg (Sept., 1852) left Barth to carry on the mission alone. He returned to Europe in Sept. 1855, after one of the most fruitful expeditions ever undertaken in inner Africa. In addition to journeys across the Sahara, Barth traversed the country from Lake Chad and Bagirmi on the east to Timbuktu on the west and Cameroon on the south, making prolonged sojourns in the ancient sultanates or emirates of Bornu, Kano, Nupe, Sokoto and Gando and at Timbuktu. He studied minutely the topography, history, civilization and resources of the countries he visited. The story of his travels was published simultaneously in English and German, under the title *Travels and Discoveries in North and Central Africa* (1857-58). For accuracy, interest, variety and extent of information Barth's *Travels* have few rivals among works of the kind. It is a book that will always rank as a standard authority on the regions in question, of which a great part, under the name of Nigeria, has since come under British rule. Barth returned to Germany, where he prepared a collection of Central

African vocabularies (Gotha, 1862-66). In 1858 he undertook another journey in Asia Minor, and in 1862 visited Turkey in Europe. In the following year he was appointed professor of geography at Berlin university and president of the Geographical Society. He died at Berlin on Nov. 25 1865.

See Schubert's *Heinrich Barth, der Bahnbrecher der deutschen Afrikaforschung* (Berlin, 1897). An edition of the *Travels* in two volumes was published in London in 1890 (Minerva Library of Famous Books).

BARTH, KASPAR VON (1587-1658), German philologist, was born at Küstrin, in Brandenburg. Of his writings the most important are: *Adversaria* (1624), a storehouse of miscellaneous learning, dealing not only with classical but also with mediaeval and modern writers; and commentaries on Claudian (1612, 1650) and Statius (1664).

BARTH, a town on the Grabow inlet of the Baltic sea, west of Stralsund, in the Prussian province of Pomerania. Pop. (1925) 7,181. Industries include shipbuilding and cabinet-making.

BARTHÉLEMY, AUGUSTE MARSEILLE (1796-1807), French satirical poet, was born at Marseille. His name can hardly be separated from that of his friend and compatriot, J. P. A. Méry (1798-1866), with whom he carried on in Paris so intimate a collaboration that it is not possible to distinguish their personalities in their joint works. In 1825 appeared a clever political satire on the Government of Charles X, *Les Sidiennes*, followed by *La Villéjade où la prise du château de Rivoli* (1827), *La Corbièreide* (1827), *La Peyronnéide* (1827), the joint productions of Barthélemy and Méry. The success was immediate and pronounced; 15 editions of the *Villéjade* were called for during the year. A rapid succession of political squibs and satires was now poured forth by the authors, among the most remarkable being *Biographie des quarante de l'académie française* (1826), and *Napoléon en Égypte* (1828), which passed through nearly a dozen editions in a year. In 1829 Barthélemy was imprisoned and fined 1,000 francs for the publication of their *Fils de l'homme*, a poem on the duke of Reichstadt, Napoleon's son. The revolution in 1830 liberated him and he and Méry celebrated the triumph of the people in one of their most brilliant efforts, *L'Insurrection*. From March 1831 to April 1832 they produced a series of verse satires issued weekly, the *Némésis*, attacking the Government and ministers of Louis Philippe. For the next few years he enjoyed a handsome pension from the Government and refrained from all satirical writing. He again resumed his old style in 1844 but without the former success.

See J. Garson, *Barthélemy et Méry étudiés spécialement dans leurs rapports avec la légende napoléonienne*, in vol. lviii of the *Mémoires* of the Académie Royale . . . de Belgique, and the *Oeuvres* of Barthélemy and Méry, collected, with a notice by L. Reybaud, in 1831.

BARTHÉLEMY, FRANÇOIS, MARQUIS DE (1747 or 1750-1830), French politician, was elected a member of the Directory in May 1797, through royalist influence, but was arrested at the *coup d'état* of the 18 Fructidor (1797) and deported to French Guiana, but escaped. He returned to France after the 18 Brumaire, entered the senate in Feb. 1800 and contributed to the establishment of the empire. In 1814 he abandoned Napoleon, and was named peer of France, after the second Restoration receiving the title marquis.

His *Papiers* were published by J. Kaulek (Paris, 4 vols, 1886-88).

BARTHÉLEMY, JEAN JACQUES (1716-1795), French writer and numismatist, was born in Cassis, Provence. In 1744 he became assistant to M. Gros de Boze, keeper of the royal collection of medals, and in 1753 succeeded him. In 1755 he accompanied the French ambassador, M. de Stainville, afterwards duc de Choiseul, to Italy, where he spent three years in archaeological research. Choiseul had a great regard for Barthélemy, and on his return to France, Barthélemy became an inmate of his house, and received valuable preferments from his patron.

Barthélemy was the author of a number of learned works on antiquarian subjects, but the great work on which his fame rests is *Voyage du jeune Anacharsis en Grèce, vers le milieu du quatrième siècle avant l'ère chrétienne* (1787). He began it in 1757 and worked on it for 30 years. The hero, a young Scythian,

descended from the famous philosopher Anacharsis, is supposed to repair to Greece for instruction in his early youth, and after making the tour of her republics, colonies and islands, to return to his native country and write this book in his old age, after the Macedonian hero had overturned the Persian empire. In the manner of modern travellers, he gives an account of the customs, government and antiquities of the country he is supposed to have visited; a copious introduction supplies whatever may be wanting in respect to historical details; whilst various dissertations on the music of the Greeks, on the literature of the Athenians and on the economy, pursuits, ruling passions, manners and customs of the surrounding states supply ample information on the subjects of which they treat.

BIBLIOGRAPHY.—Barthélemy's correspondence with Paolo Paciaudi was edited by Ch. Nisard with the *Correspondance inédite du comte de Caylus* (1877); his letters to the comte de Caylus were published by Antoine Serieys as *Voyage en Italie* (1801); and his letters to Mme. du Deffand in the *Correspondance complète de Mme. du Deffand avec la duchesse de Choiseul, l'abbé Barthélemy et M. Craufurt* (1866), edited by the marquis de Sainte-Aulaire. See also *Mémoires sur la vie de l'abbé Barthélemy, écrits par lui-même* (1824), with a notice by Lalande. His *Oeuvres complètes* (1821) contain a notice by Villenave.

BARTHÉLEMY SAINT-HILAIRE, JULES (1805–1895), French philosopher and statesman, was born in Paris on Aug. 19, 1805, and died on Nov. 24, 1895. In his early years he was a journalist, and from 1826 to 1830 opposed the reactionary policy of the king in *Le Globe*. At the revolution of 1830 he signed the protestation of the journalists on July 28, 1830. After 1830 he contributed to *Le Constitutionnel*, *Le National* and the *Courrier français* until 1833, when he turned to ancient philosophy, undertaking a translation of Aristotle, which occupied him from 1837 to 1892. He obtained the chair of ancient philosophy at the Collège de France (1838) and a seat at the Academy of Moral and Political Science (1839). After the revolution of 1848 he was elected as a republican deputy; but withdrew after the *coup d'état* of Louis Napoleon. Elected deputy again in 1869, he joined the opposition to the empire, and in 1871 supported Thiers for the presidency. Appointed senator for life in 1875, he was minister of foreign affairs in the cabinet of Jules Ferry, and promoted the establishment of a French protectorate over Tunis. His principal works, besides the translation of Aristotle (35 vols.) are. *De la logique d'Aristote* (1838); *Pensées de Marc-Aurèle* (1876); *M. V. Cousin, Sa vie et sa correspondance* (1895); *Des Védas* (1854); *Le Bouddha et sa Religion* (1860); *Du Bouddhisme* (1855); *Mahomet et le Coran* (1865).

See G. Picot, *B. Saint-Hilaire, Notice historique* (1899).

BARTHEZ or **BARTHÈS PAUL JOSEPH** (1734–1806), French physician, was born on Dec. 11, 1734, at Montpellier. He began the study of medicine at Montpellier in 1750, taking his doctor's degree in 1753. In 1759 he obtained a medical professorship at Montpellier, and in 1774 he was created joint chancellor of the university. In 1778 he published his most famous work, *Nouveaux éléments de la science de l'homme*, in which he employs the expression "vital principle" as a convenient term for the cause of the phenomena of life.

On the outbreak of the French Revolution he was settled in Paris, being consulting physician to Louis XVI. He lost much of his fortune and retired to Carcassonne, where he devoted himself to the study of theoretical medicine and wrote his *Nouvelle mécanique des mouvements de l'homme et des animaux* (1798). In 1802 he published his *Traitément des maladies gouteuses*. He died in Paris on Oct. 15, 1806. He bequeathed his books and manuscripts to J. Lordat, who published two volumes of his *Consultations de médecine* in 1810.

BARTHOLINUS, GASPARD (CASPAR BERTHESEN) (1585–1629), physician, was born in 1585 at Malmö, in Sweden. His precocity was extraordinary; at three years of age he was able to read, and in his 13th year he composed Greek and Latin orations and delivered them in public. He studied at Copenhagen and afterwards at Rostock and Wittenberg. He then travelled through Germany, the Netherlands, England, France and Italy. In 1613 he became professor of medicine in the university of Copenhagen, and filled that office for 11 years, when, falling into

a dangerous illness, he made a vow that if he should recover he would apply himself solely to the study of divinity. He fulfilled his vow by becoming professor of divinity at Copenhagen and canon of Roskilde. He died on July 13, 1620, at Sorø in Zealand.

Of his sons, **THOMAS** (1616–1680) was born at Copenhagen, where, after a long course of study in various universities of Europe, he was appointed successively professor of mathematics (1647) and anatomy (1648). During his tenure of the latter chair he distinguished himself by observations on the lymphatics. In 1661 he retired to Hagestaed. He died at Hagestaed in 1680. Another son, **ERASMUS** (1625–1698), born at Roskilde, spent 10 years in visiting England, Holland, Germany and Italy, and filled the chairs of mathematics and medicine at Copenhagen. He discovered double refraction in Iceland spar (*Experimenta crystalli islandici disdiacastici*, Copenhagen, 1669). He died at Copenhagen in 1698. In the third generation **CASPAR THOMESON** (1655–1738), son of Thomas, also taught anatomy at Copenhagen, his name being associated with the description of one of the ducts of the sublingual gland and of the *glandulae Bartholini*, while his younger brother, **THOMAS** (1659–1690), was a student of northern antiquities who published *Antiquitatum Danicarum libri tres* in 1689.

BARTHOLOMAEUS ANGLICUS (DE GLANVILLA), English Franciscan, who joined the Order in France. After studying at Oxford, he became a lector at Paris (c. 1220) and later at Magdeburg (c. 1230), whither he was invited by the general of the province of Saxony. About 1250—not 1350, as often stated—he wrote his famous *De Proprietatibus Rerum*, an encyclopaedia giving a good idea of the general culture of his day. In seeking to summarize the theories of the saints and philosophers concerning things which bear on the Scriptures, Bartholomew treats of everything from God to the lowest element, earth. Of special interest are his views on everyday life, geography, psychology, physiology, anatomy and disease, plant and animal life, cosmology and meteorology. The trend of his scientific tendencies and his metaphysical views suggest that he may have been a pupil of Grosseteste at Oxford.

The popularity of his book is attested by the early translations into many European vernaculars and by the numerous *incunabula*. It was translated into English by Trevisa in 1398 and was well known to Elizabethan writers. Selections from Trevisa are incorporated in R. Steele's *Mediaeval Lore from Bartholomew Anglicus* (1905) and in G. C. Coulton's *Social Life in Britain from the Conquest to the Reformation* (1919).

See also A. Schneider, "Metaphys. Begriffe d. B. Anglicus" in *Festgabe f. C. Baumbach* (Münster, 1913); T. Plasmann, "B. Anglicus" in *Arch. Fran. Hist.*, p. 68 sq. (biographical article) (1919); L. Thorndike, *Hist. of Magic and Experimental Science*, vol. ii. (1923).

BARTHOLOMEW, ST., the Apostle: see **APOSTLE**. For **MASSACRE** see **SAINT BARTHOLOMEW, MASSACRE OF**.

BARTHOLOMEW, JOHN (1831–1893), Scottish cartographer, was born in Edinburgh, the son of a map publisher. He was for some time assistant to the German geographer, August Petermann, until in 1856 he took up the management of his father's firm. Among his numerous publications mention may be specially made of the series of maps of Great Britain reduced from the Ordnance Survey to scales of $\frac{1}{2}$ in. and $\frac{1}{4}$ in. to 1 m., with relief shown by contours and a systematic scale of colours. The $\frac{1}{2}$ in. series was extended by his son, J. G. Bartholomew.

BARTHOLOMEW FAIR, a fair held in West Smithfield, London, on St. Bartholomew's Day from 1133 to 1855. The charter was granted by Henry I. to his former minstrel, Rahere, who had founded the priory of St. Bartholomew. For centuries the fair lasted a fortnight, but in 1691 it was shortened to four days. In 1641 it involved no less than four parishes: Christ Church, Great and Little St. Bartholomew's, and St. Sepulchre's. It was customary for the lord mayor of London to open the fair formally on St. Bartholomew's Eve. The fair grew to be a vast national market and the chief cloth sale in the kingdom. Down to 1854 it was usual for the representative of the Merchant Taylors' Guild to proceed to the cloth fair which formed part of Bartholomew Fair, and test the measures used for selling cloth

there by the company's silver yard. The fair was finally closed in 1855.

For a full account see Prof. H. Morley, *Memoirs of Bartholomew Fair* (1859).

BARTHO, JEAN LOUIS (1862–), French politician, was born at Oloron-Sainte-Marie Aug. 25, 1862. He practised as a lawyer in Pau and in 1889 was elected deputy. He became Minister of Public Works in the Cabinet of Charles Dupuy, 1894, in which Poincaré also made his début as Finance Minister. Minister of the Interior in the Méline Cabinet of 1896, he returned to the office of Minister of Public Works in 1906, under Sarrien. Successively Keeper of the Seals and Minister of Justice, he combined in 1913 the duties of Premier and Minister of Public Instruction. He was minister without portfolio in Painlevé's cabinet during the World War, Minister of War in that of Briand in 1921 and represented France at the Genoa Conference, 1922. Barthou was elected senator in July 1922 and was president of the Reparations Commission in October of the same year. In July 1926 he was appointed Vice-President and Minister of Justice in Poincaré's cabinet. His principal written works are *L'action syndicale* (1904), *Mirabeau* (1913), *Lamartine Orateur* (1916), *Les amours d'un poète* (1919) and *Le Général Hugo, 1773–1828* (1926).

BARTIN, a town in the vilayet of Zunguldak in Turkey, retaining the name of the ancient village Parthenia and situated near the mouth of the Bartan-su (anc Parthenius), which formed part of the boundary between Bithynia and Paphlagonia. The town, which is the residence of a *kaimmakam*, is built on two low limestone hills and its streets are paved with limestone blocks. It is noted for the fine box-wood grown in the vicinity, is a port of call for Black sea coasting steamers and carries on a considerable trade with Constantinople which might be increased were it not for the obstruction of the harbour by a bar. Pop (1927), 64,227.

BARTIZAN, a small battlemented turret, corbelled out at the angle of a wall or tower to protect a warder and enable him to see around him. Bartizans generally are furnished with ovlets or arrow-slits.

BARTLESVILLE, a city in the midst of the oil and gas fields of north-east Oklahoma, U.S.A., on the Caney river, 18m from the Kansas line; the county seat of Washington county. It is on Federal highway 75, is served by the Santa Fe and the Missouri-Kansas-Texas railways, and has a commercial airport. The city was incorporated in 1897. In 1900 the population was 698; in 1920, 14,417, of whom 92% were native white; and in 1927 it was estimated locally at 20,000.

About 100 oil and gas companies have offices in the city, where the first oil-well, drilled in 1897, is still producing. There are three large zinc and lead smelters. An experiment station of the U.S. bureau of mines is here, with a staff of 50 technicians occupied exclusively with problems in oil and gas. The city is well laid out, with streets 100ft wide as the rule. It has four parks, a number of substantial and handsome public and business buildings, including a fine high school and junior college, and a civic centre with a large auditorium.

BARTLETT, JOHN (1820–1905), American publisher and compiler, was born in Plymouth (Mass.), on June 14, 1820. He became a bookseller and publisher in Cambridge (Mass.), was a volunteer paymaster for a short time on the South Atlantic Squadron, and from 1865 to 1889, when he retired, was a member of the publishing house of Little, Brown and Company in Boston. In 1855 he published the first edition of his *Familiar Quotations*, subsequently greatly expanded, and in 1894, after many years' labour, he published his *New and Complete Concordance . . . of Shakespeare*, surpassing any of its predecessors in the number and fullness of its citations from the poet's writings. In all of his work he was greatly assisted by his wife, a granddaughter of President Joseph Willard of Harvard and a daughter of Sidney Willard, professor of Hebrew there. Bartlett died at Cambridge (Mass.), on Dec. 3, 1905.

See the sketches by M. H. Morgan in *Amer. Acad. of Arts and Sciences, Proceedings* (vol. 41, 1908) and by T. W. Higginson in *Carlyle's Laugh and Other Surprises* (1909).

BARTLETT, JOHN RUSSELL (1805–1886), American historical and linguistic student, was born at Providence (R.I.), Oct. 23, 1805. After a varied mercantile career he was in 1850–53 commissioner for the survey of the boundary between the United States and Mexico. As a result of this work he published *A Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuahua* (2 vols., 1854). From 1855 to 1872 he was secretary of State of Rhode Island, and in this capacity thoroughly rearranged and classified the State records, and prepared various bibliographies and compilations, relating in the main to the history of the State. He is chiefly remembered, however, for his *Dictionary of Americanisms* (1848), a pioneer work. He died in Providence, May 28, 1886.

BARTLETT, PAUL WAYLAND (1865–1925), American

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

sculptor, was born in New Haven (Conn.), the son of Truman H. Bartlett, an art critic and sculptor. When 15, he began to study at Paris under Frémiat, modelling from animals in the Jardin des Plantes. He won a medal at the Paris Salon of 1887. Among his early works are: "The Bear Tamer," in the Metropolitan Museum of Art, New York; the equestrian statue of Lafayette, in the Place du Carrousel, Paris, the powerful and virile Columbus and Michelangelo, in the congressional library, Washington, D.C.; the "Ghost Dancer," in the Pennsylvania academy, Philadelphia; the "Dying Lion"; the equestrian statue of McClellan in Philadelphia; and a statue of Joseph Warren in Boston, Massachusetts. Of his later works the most notable are the group in the pediment over the House wing of the Capitol, Washington, D.C.; the six statues in front of the New York public library; a statue of Benjamin Franklin at Waterbury (Conn.), and "Patriotism" in red granite at Duluth, Minnesota. He was made a commander of the Legion of Honour shortly before his death in Paris on Sept. 20, 1925.

BARTÓK, BÉLA (1881–), Hungarian composer and pianist. Born March 25, 1881 at Nagyszentmiklós, Transylvania, he began composition at the age of nine and studied first under László Erkel and later at the musical academy, Budapest, under Stephen Thoman and John Koessler. In 1903 his symphonic poem "Kossuth" was performed in Manchester under Hans Richter. The strong national movement prevailing in Hungary at this time influenced his work considerably and resulted in his researches into folk music and traditional melodies. The outbreak of the World War put an end to his travels, and he became, of necessity, reserved and isolated. The post-War generation, however, hailed him with enthusiasm. Among his most notable works are "Bluebeard" (1918) and the pantomime, "The Wonderful Mandarin." He has also written chamber music and numerous works for the piano and has published many collections of folk-tunes. In 1906 he became a professor at the musical academy, Budapest.

BARTOLI, DANIELLO (1608–1685), Italian Jesuit priest, was born at Ferrara and entered the Society of Jesus in 1623. He became rector of the Jesuit college in Rome in 1685, and wrote the *Istoria della compagnia di Gesù* (1650–73); it is of value in regard to the early work of the Society in Asia. He died at Rome.

A collected edition of his works was published in 12 vols. by Marietti at Turin (1825–56); another in 50 vols. at Florence (1826).

BARTOLINI, LORENZO (1777–1850), Italian sculptor, was born in Vernio in Tuscany. After acquiring reputation as a modeller in alabaster, he went in 1797 to Paris, where he studied painting under Desmarests, and afterwards sculpture under F. F. Lemot. For Napoleon he executed a colossal bust, and was sent by him to Carrara to found a school of sculpture. The rest of his life was spent there and in Florence. His works are varied and include an immense number of busts. The group of Charity, the "Hercules and Lichas" and the "Faith in God," are among the best examples of his work.

BARTOLOMMEI, MARQUIS FERDINANDO (1821–1869), Italian revolutionary, belonged to an old and noble Florentine family. In 1847–48 his house was a centre of revolutionary committees, and during the brief constitutional régime he was very prominent. After the return of the grand duke Leopold II. he became a conspirator on behalf of Italian freedom and unity, allying himself with the popular party and quitting the semi-liberal nobles. On the outbreak of war between Piedmont and Austria he worked hard for the overthrow of the grand duke, and on April 27, 1859, Florence rose as one man, the troops refused to fire on the people, and the grand duke departed, never to return. A provisional government was formed and Bartolommei elected *gonfaloniere*. In the summer elections were held, and on the meeting of parliament Bartolommei's unitarian views prevailed, the assembly voting the resolution that the house of Lorraine had forfeited its rights and that Tuscany must be united to Italy under King Victor Emmanuel. Bartolommei was made senator of the Italian kingdom and received various other honours. His last years were spent in educational and philanthropic work.

The best biography of Bartolommei is contained in *Il Rivolgimento Toscano e l'azione popolare*, by his daughter Matilde Gioli (Florence, 1905).

BARTOLOMMEO DI PAGHOLO, FRA (1475–1517), the Italian historical and portrait painter—known also as BACCIO (short for Bartolommeo) DELLA PORTA (because he lived near the Porta Romana), was born in Soffignano, near Florence, and died in Florence on Oct. 31, 1517. He was a pupil of Cosimo Roselli, and was a close student of the works of Leonardo da Vinci. Of his early productions, the most important is the fresco of the Last Judgment, in which he was assisted by his friend Mariotto Albertinelli. He came under the influence of Savonarola, and was so affected by his death that he soon after entered the Dominican convent and for some years gave up his art. He had not long resumed it, in obedience to his superior, when Raphael came to Florence and formed a close friendship with him. Bartolommeo learned from the younger artist the rules of perspective, while Raphael owes to the *frate* the improvement in his colouring and handling of drapery. Some years afterwards he visited Rome, and was struck with a feeling of his own inferiority when he contemplated the masterpieces of Michelangelo and Raphael. On his return he painted the magnificent figure of St. Mark (his masterpiece, at Florence) and the undraped figure of St. Sebastian. He painted a profile portrait of his friend Savonarola in the character of St. Peter Martyr. The majority of Bartolommeo's compositions are altar-pieces. The best collection of his works is in the Pitti Palace, Florence. The Louvre possesses an "Annunciation" and a "Virgin in Glory," and there are examples in the National Gallery, at Panshanger, and in Berlin and elsewhere.

See F. Knapp, *Fra Bartolommeo und die Schule von San Marco* (Halle, 1903); H. von der Gabelentz, *Fra Bartolommeo und die Florentiner Renaissance* (Leipzig, 1922).

BARTOLOMMEO VENETO (c. 1480–1555), Italian painter, a pupil of Gentile Bellini at Venice, influenced later by the Milanese school. He lived for some time at Cremona and also worked at Ferrara. Very little is known of this painter, whose fine portraits are much sought after and highly prized. He was until recently almost unknown and it is mainly due to the researches of Giovanni Morelli and Adolfo Venturi that he was identified as the author of a few striking paintings. His colour is brilliant and harmonious, his drawing hard, precise and powerful. His earliest work extant is the "Madonna" from the Casa Martinengo in Val Sansibio, now with Conte Donà delle Rose at Venice. It is dated 1502, and bears the curious signature *Bartolamio mezo Venizian e mezo Cremonese*. In his later signatures he calls himself simply Venetian. Other early works are the "Madonna and Child" (1505) with a remarkable landscape background, at the Bergamo museum, and the "Circumcision" signed and dated 1506, now in the possession of the Hon. Mrs. Trollope of Crowcombe Court, Taunton. These works are Bellinesque; and from a "Madonna" once in the Ercolani Collection at Bologna, which bore the mutilated inscription, 1509. a di 7. Aprile, *Bartolamio Scholario de Ze* Be it must be concluded that he was the pupil of Gentile

Bellini, "Ze" standing for "Ge" in the Venetian dialect. Later in his career Bartolommeo took to portrait painting, and a number of portraits from his hand show the influence of the Milanese school. One of the finest portraits is that of Lodovico Martinengo (1530) in the National Gallery, London. The striking portrait of Massimiliano Sforza (1512), of the Holford Collection, is now in America.

The Fitzwilliam Museum, Cambridge, England, the Ambrosiana at Milan and the Budapest gallery also possess male portraits by him. His female portraits are distinguished for their somewhat fantastic and original arrangement. The Staedel Institut of Frankfurt has a so-called "Lucrezia Borgia" whose golden locks of almost metallic texture are carefully arranged in rows of long corkscrews like ringlets. A similar coiffure is to be seen in the "Salome" at Dresden and in the "Woman breaking a ring" in the collection of Duca Melzi at Milan. The Conte Cesare de Mayno, Milan, has a "Lady playing a Lute" dated 1520, the "Ceres" of the Hertz Collection, now in the Palazzo Venezia, Rome, has recently been ascribed to the artist. The Albertina at Vienna has a drawing of a head, of clear and masterly execution.

See S. Lermolieff, *Gal. Borghese und Doria Pamf.* (1890), and *Gal. München und Dresden* (1891); A. Venturi, *La Galleria Crespi* (1900) and an important paper, "Orig. d. pitt. venez." in *L'Arte* II. (1907); Crowe and Cavalcaselle, *History of Painting in North Italy* (ed. Borenius, 1912); J. P. Richter, *La Collezione Hertz* (1928).

BARTOLOZZI, FRANCESCO (1727–1815), Italian engraver, was born at Florence, on Sept. 21, 1727, and died on March 7, 1815. He was originally destined to follow the profession of his father, who was a gold-and-silver-smith, but he manifested so much skill and taste in designing that he was placed under the superintendence of two Florentine artists, who instructed him in painting. After devoting three years to that art, he went to Venice and studied engraving, being apprenticed to Joseph Wagner. He then removed to Rome, where he engraved works by Domenichino and other Italian masters, and completed a set of engravings representing events from the life of St. Nilus, and, after returning to Venice, he set out for London in 1764 at the invitation of Mr. Dalton, librarian to George III. He became engraver to the king. For nearly 40 years he resided in London with his friend Cipriani, in Warwick street, Golden square, London, and executed a large number of engravings for George III. which are still in the royal collections, including the engravings after Holbein's drawings at Windsor. Among others are those of "Clytie" and "Silence," after Annibale Caracci; of the "Virgin and Child," after Carlo Dolce, and of the "Madonna del Sacco," after Andrea del Sarto. He engraved many works of Cipriani and Angelica Kauffmann. Bartolozzi also contributed a number of plates to Boydell's *Shakespeare Gallery*. In 1802 he was invited to Lisbon as director of the National academy. He remained in Portugal till his death.

In his later years in London Bartolozzi had a studio where many works, signed with his name, but to which he only put the finishing touches, were produced. He was not the inventor of the red chalk manner of engraving, which was already practised in France by Demortenu, but, encouraged by Angelica Kauffmann, Bartolozzi made it the fashion. His son, Gaetano Stephano (1757–1821), also an engraver, was the father of Madame Vestris (q.v.).

See A. Tuer, *Bartolozzi and his Works* (1882); C. H. S. John, *Bartolozzi, Zoffany, Kauffmann with other Foreign Members of the R.A., 1768–92* (vol. xvi. of *British Artists*, 1924).

BARTOLUS (1314–1357), Italian jurist, the most famous master of the dialectical school, was born at Sassoferrato, whence his usual style of Bartolus de Saxoferrato. He studied law under Cinus at Perugia and under Oldradus and Jacobus de Belvisio at Bologna. He held the chair of law at Perugia from 1343 onwards, and made the law school of Perugia as famous as that of Bologna. A magnificent monument was raised to his memory in the church of San Francisco at Perugia.

Many writers have sought to account for the fame of Bartolus by attributing to him the introduction of the dialectical method; but this had been employed by Odofredus, a pupil of Accursius, in the 13th century, and the successors of Odofredus had abused it by burying the subject-matter of their writings under dialectical forms. Bartolus reformed this abuse and avoided excess; but his

great reputation was probably due to his revival of the exegetical system of teaching law. He imparted to his lectures a practical interest by making use of the experience he had gained as an assessor to the courts at Todi and Pisa. His treatises *On Evidence* and *On Procedure* are his best-known works; his *Commentary on the Code of Justinian* has sometimes been exalted almost to an equal authority with the code itself.

BARTON, BENJAMIN SMITH (1766–1815), American naturalist, was born at Lancaster, Pa., in 1766. When only 24 years old he was appointed to a professorship of natural history and botany at the College of Philadelphia, now the University of Pennsylvania—probably the first position of its kind in any American college. Later he became professor of *materia medica* (1795) and successor to Dr. Benjamin Rush in the chair of practical medicine (1813).

Having an ardent thirst for literary fame as well as wide scientific knowledge, he wrote books on such diverse subjects as the natural history of Pennsylvania, the disease of goitre, the *Fascinating Faculty Which Has Been Ascribed to the Rattlesnake and Other North American Serpents*, the honey-bee, the stimulant effects of camphor on vegetables, and numerous other subjects in natural history, botany and *materia medica*, the best known being his *Elements of Botany* (1803). In 1802 he was chosen president of the American Philosophical Society and was a member of honorary scientific societies in Moscow, London, Scotland and Denmark. He died in Philadelphia, Dec. 19, 1815.

See *Pioneers of Science in America*, edited by W. J. Youmans (1896).

BARTON, BERNARD (1784–1849), English poet, was born at Carlisle on Jan. 31, 1784. His parents were Quakers, and he was commonly known as the Quaker poet. He was a bank clerk at Woodbridge, Suffolk. Barton published several volumes of verse, but is chiefly remembered for his friendship with Charles Lamb, which arose out of a remonstrance addressed by him to Lamb on the freedom with which the Quakers had been handled in the *Essays of Elia*. When Barton contemplated resigning his bank clerkship and supporting himself entirely by literature, Lamb dissuaded him. "Keep to your bank," he wrote, "and the bank will keep you." Barton died at Woodbridge on Feb. 19, 1849. His daughter Lucy married Edward FitzGerald.

See *Poems and Letters of Bernard Barton*, selected by Lucy Barton, with a biographical notice by Edward FitzGerald (1849).

BARTON, CLARA (1821–1912), American philanthropist, was born in Oxford (Mass.), in 1821. During the Civil War she distributed supplies for the relief of wounded soldiers; and at its close she organized at Washington a bureau of records to aid in the search for missing men. In connection with this work she identified and marked the graves of more than 12,000 soldiers in the National Cemetery at Andersonville, Georgia. During the Franco-Prussian War, Miss Barton assisted in organizing military hospitals. In 1871 she superintended the distribution of relief to the poor in Strasbourg and in 1872 performed a like service in Paris. For her services she was decorated with the Iron Cross by the German emperor. In 1873 she returned to the United States, where she at once began her efforts to effect the organization of the United States branch of the Red Cross and to bring her country into the Treaty of Geneva. Her efforts were successful in 1881–82. She was the first president of the American Red Cross, holding the position until 1904. She represented the United States at the international conference held at Geneva, 1884; Karlsruhe, 1887; Rome, 1892; Vienna, 1897; and St. Petersburg (Leningrad), 1903. She was the author of the American amendment to the constitution of the Red Cross which provides that the society shall distribute relief not only in war but in times of such other calamities as famines, floods, earthquakes, cyclones and pestilence. She conducted the society's relief for sufferers from the yellow fever in Florida (1887), the flood at Johnstown, Pa. (1889), the famine in Russia (1891), the hurricane along the coast of South Carolina (1893), the massacre in Armenia (1896), the Spanish-American War in Cuba (1898), the hurricane at Galveston, Texas (1900), and several other calamities. She wrote *An Official History of the Red Cross* (1882); *The Red Cross in Peace and War* (1898);

A Story of the Red Cross (1904), and *Story of my Childhood* (1907). She died at Glen Echo (Md.), on April 12, 1912.

See Corra Bacon-Foster, *Clara Barton, Humanitarian* (1918).

BARTON, SIR EDMUND (1849–1920), Australian lawyer and statesman, was born in Sydney Jan. 18 1849. Educated at the grammar school and university there, he was called to the bar in 1871, becoming a Q.C. in 1889. He was elected to the New South Wales legislature by the University of Sydney in 1870. From 1883 to 1887 he was speaker of the house of assembly; and in 1889 he became attorney-general. In 1896 he had succeeded Sir Henry Parkes as leader of the Federation movement; and in 1900 he led the delegation which presented the Commonwealth Constitution bill to the Parliament in London. The following year he became Australia's first Federal prime minister. He held office for two years, when he was made senior puisne judge of the high court of Australia, being succeeded in the premiership by Alfred Deakin. Sir Edmund was throughout his career an ardent supporter of imperial preference and an advocate of protection. He died suddenly at Medlow Bath, near Sydney, Jan. 6 1920. Known affectionately as the Father of Australia, he inspired throughout his long career as a politician a deep personal devotion.

See H. G. Turner, *The First Decade of the Australian Commonwealth* (1911).

BARTON, ELIZABETH (c. 1506–1534), "the maid of Kent," was, according to her own statement, born in 1506 at Aldington, Kent. In 1525, when she was a servant in the house of Thomas Cobb, steward of an estate near Aldington owned by William Warham, archbishop of Canterbury, she had an illness, after which she passed into trances and uttered prophecies. Cobb reported the matter to the parish priest, who in turn acquainted Archbishop Warham. After her recovery the girl continued to feign trances, and as her fame steadily grew, the archbishop in 1526 instructed the prior of Christ church, Canterbury, to send two of his monks to hold an enquiry into the case. One of these latter, Edward Bocking, obtained her admission as a nun to St. Sepulchre's convent, Canterbury. Under Bocking's instruction Barton's prophecies became still more remarkable, and attracted many pilgrims, who believed her to be in direct communication with the Virgin Mary. Her utterances were directed towards political matters, and she declared that should Henry persist in his intention of divorcing Catherine he "should no longer be king of this realm . . . and should die a villain's death." Even such men as Fisher, bishop of Rochester, and Sir Thomas More, corresponded with Barton. In 1532 Henry passed through Canterbury and is said to have seen the nun who tried to terrify him into abandoning his marriage. After its solemnization in May 1533, her utterances becoming still more treasonable, she was examined before Cranmer, and confessed. In Jan. 1534, by a bill of attainder the maid and her chief accomplices were condemned to death, and they were executed at Tyburn on April 20.

See F. A. Gasquet, *Henry VIII and the English Monasteries* (ch. iii. 1899 ed.); T. E. Bridgett, *Life of Blessed John Fisher* (1888); vols. vi. and vii. of *Letters and Papers of Henry VIII.*; James Gairdner, *The English Church in the 16th Century* (1899); Strype, *Memoirs*, I. i. 271, and *Cranmer*; A. D. Cheyney, "The Holy Maid of Kent," in *Transactions of the Royal Historical Society*, NS xviii. A detailed account of the case is contained in the published Act of Attainder 25 Henry VIII. c. 12.

BARTON-UPON-HUMBER, urban district of Lindsey, North Lincolnshire, England, terminus of L N E. branch railway, 44m. N. by E. of Lincoln. Pop. (1921) 6,453. It lies near low hills, on flat ground bordering the Humber, though its centre is a mile from the river. Barton appears in Domesday, with its ferry over the Humber. It rose into importance as a seaport, for it supplied eight ships and men to the expedition of Edward III. to Brittany. The church of St. Peter has a west tower of pre-Conquest workmanship, with early Norman top storey. It is arcaded in the two lower storeys, having round arches in the lower and triangular in the upper, and there is a round-headed south doorway and a triangular-headed north doorway. The rest of the church is Decorated and Perpendicular. A low pre-Conquest building 15 ft. by 12, with deeply splayed windows, stands against the west face. The church of St. Mary is fine Early English with

Perpendicular clerestory. Industries include brick-making and metal working.

BARTOW, a city in the lake region of Florida, U.S.A., 45m. east of Tampa, on the ridge running through the State from north to south; the county seat of Polk county. It is served by the Atlantic Coast Line and the Seaboard Air Line railways. The population in 1925 (State census) was 4,593, of whom 1,532 were negroes. Bartow is surrounded by extensive orange, grapefruit and banana groves, immense phosphate mines, and irrigated farms, and has a variety of manufacturing industries. There are two large and beautiful lakes (Hancock and Polk) near by.

BARTSCH, PAUL (1871–), American biologist, was born in Tuntschendorf, Germany, on Aug. 14, 1871. Following his graduation at the State University of Iowa in 1896 he joined the staff of the U.S. National museum, Washington, in which he served as aid in the division of mollusks from 1896 to 1905 and as assistant curator of marine invertebrates from 1905 until 1914 when he was made curator. In 1899 he became professor of zoology in George Washington university, and in 1901 lecturer on medical zoology in Howard university. The U. S. bureau of fisheries in 1907 placed him in charge of the inquiry into the pearl-mussel industry of the Mississippi valley. Subsequently he was the representative of the Smithsonian institution on various scientific expeditions to the waters of the Philippines, Cuba, Haiti and the Bahamas. In 1912 he took charge of the experimental breeding of Cerions on the Florida Keys for the Carnegie and Smithsonian institutions. He made war gas experiments for the U.S. bureau of mines, and in 1918 produced a poison gas detector for the Chemical Warfare Service. His published writings include more than 250 technical papers, chiefly on biological subjects.

BARUCH, the name (meaning "blessed" in Hebrew) of a character in the Old Testament (Jer. xxxvi., xxxvii., xliii.), associated with the prophet Jeremiah, and described as his secretary and spokesman.

BOOK OF BARUCH

This deuterocanonical book of the Old Testament is placed by the LXX. between *Jeremiah* and *Lamentations*, and in the Vulgate after *Lamentations*. It consists of several parts, which cohere so badly that we are obliged to assume plurality of authorship.

The book consists of the following parts:—

i. 1–14. The historical preface with a description of the origin and purpose of the book.

ii. 15–ii. 5. A confession of sin used by the Palestinian Remnant. This confession was according to i. 14 sent from Babylon (i. 4, 7) to Jerusalem to be read "on the day of the feast and on the days of the solemn assembly." The confession is restricted to the use of the remnant at home (*see* next paragraph). In this confession there is a national acknowledgment of sin and a recognition of the exile as a righteous judgment.

iii. 6–iii. 8. A confession of the captives in Babylon and a prayer for restoration. This confession opens as the former (in i. 15) with the words found also in Daniel ix. 7, "To the Lord our God belongeth righteousness, etc." The confession is of the Exiles and not of the remnant in Palestine, as Marshall has pointed out. Thus it is the Exiles clearly who are speaking in ii. 13, "We are but a few left among the heathen where thou hast scattered us"; ii. 14, "Give us favour in the sight of them which have led us away captive"; iii. 7, "We will praise thee in our captivity"; iii. 8, "We are yet this day in our captivity where thou hast scattered us." On the other hand, the speakers in the confession in i. 15–ii. 5 are clearly the remnant in Jerusalem, i. 15, "To the Lord our God belongeth righteousness but unto us confusion of face . . . to the men of Judah and the inhabitants of Jerusalem." The Exiles are mentioned by way of contrast to the speakers; ii. 4, 5, "He hath given *them* to be in subjection to all the kingdom that are round about *us* to be a reproach among all the people round about where the Lord hath scattered *them*. Thus were they cast down . . . because *we* sinned against the Lord our God."

iv. 9–iv. 4. The glorification of wisdom, that is, of the law. Israel is bidden to walk in the light of it; it is the glory of Israel and is not to be given to another.

v. 5–v. 9. Consolation of Israel with the promise of deliverance and lasting happiness and blessing to Jerusalem.

From the foregoing description it seems clear that the book is derived from a plurality of authors. The evidence for a fourfold authorship is strong though not convincing. In any case i.–iii. 8 and iii. 9–v. 9 must be ascribed to different authors.

It is generally agreed that i.–iii. 8 was originally written in Hebrew; the rest in Greek. As regards the date, the fifth year after the destruction of Jerusalem, mentioned in i. 2, will give the date for the first part of the book as A.D. 74 or 75, but it is evident that the writer made use of earlier material. Thus i. 15–iii. 8 is strongly liturgical in character; it has all the leading notes found in the Jewish liturgy, which in its essential elements goes back to pre-Christian times (for details *see* Oesterley, *The Books of the Apocrypha*, pp. 500 *seq.*). The section iii. 8–iv. 4 is a little later, but not later than the middle of the 2nd century A.D., as it is quoted by Athenagoras and Irenaeus. The last section iv. 5–v. 9 is probably a little earlier, the beginning of this century.

APOCALYPSE OF BARUCH

The discovery of this long lost apocalypse was due to Ceriani. This apocalypse has survived only in the Syriac version of which Ceriani discovered a 6th century ms. in the Milan library. The Syriac is translated from the Greek; for Greek words are occasionally transliterated, and passages can be explained only on the hypothesis that the wrong alternative meanings of certain Greek words were followed by the translator. The Greek in turn is derived from the Hebrew, for unintelligible expressions in the Syriac can be explained and the text restored by retranslation into Hebrew.

As there are undoubtedly conflicting elements in the book, it is possible to assume either a diversity of authorship or a diversity of sources. A short summary may here be given of the grounds on which a diversity of authorship has been postulated. If the letter to the tribes in captivity (lxxviii.–lxxxvi) be disregarded, the book falls into seven sections separated by fasts, save in one case (after xxxv.) where the text is probably defective. These sections, which are of unequal length, are—(1) i.–v. 6; (2) v. 7–viii.; (3) ix.–xii. 4; (4) xii. 5–xx; (5) xxi.–xxxv.; (6) xxxvi.–xlvi.; (7) xlvii.–lxxvii. These treat of the Messiah and the Messianic kingdom, the woes of Israel in the past and the destruction of Jerusalem in the present, as well as of theological questions relating to original sin, free will, works, the number of the saved, the nature of the resurrection body, etc. The views expressed on several of the above subjects are often conflicting. In one class of passages there is everywhere manifest a vigorous optimism as to Israel's ultimate well-being on earth, and the blessedness of the chosen people in the Messianic kingdom is sketched in glowing and sensuous colours (xxix., xxxix.–xl., lxiii.–lxxiv.). Over against these passages stand others of a hopelessly pessimistic character, wherein, alike as to Israel's present and future destiny on earth, there is written nothing save "lamentation, and mourning, and woe." The world is a scene of corruption, its evils are irremediable, its end is nigh, and the advent of the new and spiritual world is at hand.

The affinities of this book and IV. Ezra are so numerous that Ewald and Ryle assumed identity of authorship. But their points of divergence are so weighty that this view cannot be sustained. Three courses still remain open. If we assume that both works are composite, we shall perforce admit that some of the constituents of IV. Ezra are older than the latest of Baruch, and that other constituents of Baruch are decidedly older than the remaining ones of IV. Ezra. On the other hand, if we assume unity of authorship, it seems impossible to arrive at finality on the chronological relations of these two works. Langen, Hilgenfeld, Wieseler, Stähelin, Renan, Hausrath, Drummond, Dillmann, Rosenthal and Gunkel have maintained on various grounds the priority of IV. Ezra; and Schürer, Bissell, Thomson, Deane, Kabisch, De Faye, Wellhausen and Ryssel the priority of Baruch on grounds no less convincing.

A very close relation subsists between this book and rabbinical literature; in some instances they are almost word for word.

In lxxvii. 19 it is said that Baruch wrote two epistles, one to the nine and a half tribes and the other to the two and a half at Babylon. The former is found in lxxviii.-lxxxvi.; the latter is lost, but is probably preserved either wholly or in part in the Book of Baruch, iii. 9-iv. 29. On the other hand, it is not necessary to infer from lxxv. that an account of Baruch's assumption was to be looked for in the book.

The literature is cited in R. H. Charles, *Apocalypse of Baruch*, pp. xxx.-xliii. Ginzberg's article in the *Jewish Encyclopaedia*, ii. 551-556, is a fresh and valuable contribution.

REST OF THE WORDS OF BARUCH

This book was undoubtedly written originally by a Jew but was subsequently revised by a Christian, as has been shown by Kohler in the *Jewish Quarterly Review* (1893), pp. 407-409. It passed under a double name in the Abyssinian Church, where it was known both as "the Rest of the Words of Baruch" and "the Rest of the Words of Jeremiah." It has been preserved in Greek, Ethiopic, Armenian and Slavonic. The Greek was first printed at Venice in 1609, next by Ceriani in 1868 in his *Mon. Sacra*, v. 11-18; by Harris, *The Rest of the Words of Baruch*, in 1889; and Basiliev, *Anc. Graeco-Byzantina*, i. 308 seq. (1893). The books begin like the Syriac Apocalypse of Baruch with an account of the removal of the sacred vessels of the temple before its capture by the Chaldees. Baruch remains in Jerusalem and Jeremiah accompanies the exiles to Babylon. After 66 years' exile Jeremiah brings back the Jews to Jerusalem, but refuses to admit such as had brought with them heathen wives. Then follows a vision of Jeremiah which is Christian.

Harris regards the book in its present form as an eirenicon addressed to the Jews by a Christian after the rebellion of Bar Cochba (Barcochebas) and written about 136. Though the original work was dependent on the Apocalypse of Baruch it cannot have been written much before the close of the 1st century A.D. Its *terminus ad quem* is at present indeterminable.

See further the additions and commentaries in Charles, *Apocrypha and Pseudepigrapha*. (R. H. CH.; W. O. E. O.)

BARUCH, BERNARD MANNES (1870-), American financier, was born in Camden (S.C.), Aug. 19, 1870. For many years he was a member of the New York Stock Exchange. In 1916 he was appointed a member of the advisory committee of the Council of National Defence, and subsequently became chairman of the committee on raw materials, minerals and metals, and of the war industries board. In 1919 he became a member of the Supreme Economic Council of the Peace Conference in Paris, and in the same year was appointed by President Wilson a member of the industrial conference in Washington. He wrote *The Making of the Reparation and Economic Sections of the Treaty* (1920) and articles for the *Encyclopædia Britannica*.

BARUGO, a municipality (with administration centre and 15 barrios or districts) on the north coast of the province and island of Leyte, Philippine Islands, on Carigara bay. Pop. (1918), 16,187 of whom 8,075 were males and one was white. It exports large quantities of abacá and copra, and imports rice, petroleum and cotton goods. In 1918 it had three manufacturing establishments, with output valued at 21,800 pesos, besides 154 household industry establishments, with output valued at 51,000 pesos. Of the eight schools seven were public. The language is a dialect of Bisayan.

BARWANI, an Indian State in the Bhopawar agency of Central India, in the Satpura mountains, south of the Narbada. Area, 1,178 sq. m.; pop. (1921) 120,150. Many of the inhabitants are Bhils. The chief or rana, who has a salute of nine guns, is a rajput of the Sesodia clan, connected with the Udaipur family. Though the family lost most of its possessions during the Maharratta invasion in the 18th century, it never became tributary to any Malwa chief. The small town of Barwani is near the left bank of the Narbada.

BARYATINSKY, ALEXANDER IVANOVICH, PRINCE (1814-1879), Russian soldier and governor of the Caucasus, entered the army in 1833. In 1835 he served with great

gallantry in the Caucasus, and on his return to St. Petersburg was rewarded with a gold sword "for valour." In 1845 he was again ordered to the Caucasus and most brilliantly distinguished himself, especially in the attack on Shamyl's stronghold. In 1846 he assisted Field Marshal Paskievich to suppress the Cracow rising. From 1848 to 1856 he took a leading part in all the chief military events in the Caucasus, his most notable exploits being his victory at Mezeninsk in 1850 and his operations against Shamyl at Chechen. His energetic and at the same time systematic tactics inaugurated a new era of mountain warfare. In 1853 he became chief of the staff. In 1854 he took part in the brilliant Kürük Dere campaign. On Jan. 1, 1856, he became commander-in-chief of the Caucasian army, and, subsequently, governor of the Caucasus. Within three years of his appointment, the whole of the eastern Caucasus was subdued, and the elusive Shamyl was captured. Baryatinsky also conquered many of the tribes of the western Caucasus dwelling between the rivers Laba and Byelaya. For these fresh services he was created a field marshal, but on Dec. 6, 1862, he was, at his own request, relieved of his post, and he spent the last years of his life abroad.

See A. L. Zisserman, *Field Marshal Prince A. I. Baryatinski* (Russ.) (Moscow, 1888-91).

BARYCENTRIC CALCULUS, a system of geometric analysis developed by August Ferdinand Mobius (*qv*) and founded on a generalization of the notion of centre of mass (or centre of gravity) of a system of mass particles. This explains the significance of the term "barycentric," from Gr. *βαρύς*, barys', heavy, and *κέντρον*, ken'tron, centre. Mobius was in possession of his method in 1823, and he published a general development of it in 1827.

If two particles of weights α and β are attached to the ends A and B, respectively, of a weightless rod AB, then there is a point P on AB such that the rod may be balanced, under the force of gravity, on a support at P. It will then exert on the support at P a pressure equal to that produced by a weight of $\alpha + \beta$. It may be shown that the point P is situated so that its distances from A and B, respectively, are in the ratio of β to α ; that is, so that $AP:PB = \beta:\alpha$. This point P is called the centre of gravity (or centre of mass) of the particles at A and B. Similarly, there is a centre of gravity or balancing point P for particles of weights α, β, γ , placed at the respective vertices A, B, C of a triangle ABC; and the notion is extensible to any number of masses situated either in a plane or in space. The point P may be called the *barycentre* for the given masses with the given positions, and we may attach to it a weight equal to the sum of the weights of the given masses, since the system, when supported at the barycentre, or balancing point P, exerts at P a pressure equal to that due to the sum of the weights of the particles.

In the generalization of the foregoing notions, according to the method of Mobius, there may be associated with a given point A any real (positive, negative, or zero) numerical quantity α , called its *weight*, the weighted point being denoted by αA . The sum of two weighted points αA and βB is defined to be the weighted point $(\alpha + \beta)G$, where G is a point on the directed line AB such that $AG:GB = \beta:\alpha$; we then write $\alpha A + \beta B = (\alpha + \beta)G$. By means of geometry it is proved that $(\alpha A + \beta B) + \gamma C = \alpha A + (\beta B + \gamma C) = (\alpha + \beta + \gamma)P$, where P is the (generalized) centre of mass of particles of weights α, β, γ placed at A, B, C respectively. More generally, we have $\alpha A + \beta B + \gamma C + \dots + \lambda L = (\alpha + \beta + \gamma + \dots + \lambda)X$, where in general X is a determinate point, this point is called the *barycentre* of the weighted points $\alpha A, \beta B, \dots, \lambda L$. If $\alpha + \beta + \gamma + \dots + \lambda$ is zero, the point X lies at infinity in a determinate direction except when $-\alpha A$ is the barycentre of $\beta B, \gamma C, \dots, \lambda L$, in which case $\alpha A + \beta B + \dots + \lambda L$ vanishes and X itself is indeterminate.

If ABCD is a given tetrahedron of reference and if P is any given point in space, then weights $\alpha, \beta, \gamma, \delta$ may be assigned to A, B, C, D, respectively, so that $\alpha A + \beta B + \gamma C + \delta D = (\alpha + \beta + \gamma + \delta)P$. It is evident that the quantities $\alpha, \beta, \gamma, \delta$ may be replaced by $k\alpha, k\beta, k\gamma, k\delta$, without affecting the validity of this equation, if k is any real numerical quantity different from zero. Hence the numbers $\alpha, \beta, \gamma, \delta$ may serve as a set of homo-

geneous co-ordinates of P. Thus the barycentric calculus affords a remarkable system of co-ordinates for representing the points of space. In the case of a plane, three fixed points of reference in the plane are sufficient; and in the case of a line, only two points on the line are needed. Since it furnishes such a set of co-ordinates, the barycentric calculus has been one of the important means leading to the development of the powerful methods of modern projective geometry. In another aspect it has also been the forerunner of important work in modern algebra.

See A. F. Möbius, *Der barycentrische Calcul* (Leipzig, 1827), reprinted in his *Gesammelte Werke*, vol. i., pp. 1-388; and *Encyklopädie der mathematischen Wissenschaften* (Leipzig), vol. iii., pp. 1289-1300. The former contains the original development of the barycentric calculus by Möbius; the latter gives a brief summary and a history, with adequate references to the literature. (R. D. CA.)

BARYE, ANTOINE LOUIS (1796-1875), French sculptor, was born in Paris on Sept. 24, 1796. Like many of the sculptors of the Renaissance he began life as a goldsmith. After studying under Bosio, the sculptor, and Gros, the painter, he was in 1818 admitted to the École des Beaux Arts. In 1823, when he was working for Fauconnier, the goldsmith, he discovered his real bent from watching the wild beasts in the Jardin des Plantes, making vigorous studies of them in pencil drawings and then modelling them in sculpture on a large or small scale. In 1831 he exhibited his "Tiger devouring a Crocodile," and in 1832 had mastered a style of his own in the "Lion and Snake." Thenceforward Barye, though engaged in a perpetual struggle with want, exhibited year after year these studies of animals—admirable groups which reveal him as inspired by a spirit of true romance and a feeling for the beauty of the antique, as in "Theseus and the Minotaur" (1847), "Lapitha and Centaur" (1848), and numerous minor works. As examples of his larger work we may mention the Lion of the Column of July, of which the plaster model was cast in 1839, various lions and tigers in the gardens of the Tuileries, and the four groups—War, Peace, Strength and Order (1854). In 1852 he cast his bronze "Jaguar devouring a Hare." He was made professor at the museum in 1854, and was elected to the Academy of Fine Arts in 1868. He died on June 25 1875.

See Arsène Alexandre, "A. L. Barye." *Les Artistes célèbres*, ed. E. Muntz (1880) (with a bibliog.); Charles DeKay, *Life and Works of A. L. Barye* (1880), published by the Barye Monument Assoc. of New York; Roger Ballu, *L'Oeuvre de Barye* (1890).

BARYTES, a widely distributed mineral composed of barium sulphate (BaSO_4). Its most striking feature and the one from which it derives its name barytes, barite (from the Greek *βαρύς*, heavy) or heavy spar, is its weight. Its specific gravity of 4.5 is about twice as great as that of salt and of many other colourless, transparent and glassy minerals not unlike barytes in general appearance. The mineral is usually found in a state of considerable chemical purity, though small amounts of strontium and calcium sulphates may isomorphously replace the barium sulphate.

A CRYSTAL OF BARYTES Showing the simplest form of crystal and also the cleavage form. However complex the crystals, they break up along cleavages into this characteristic shape

Crystals of barytes are orthorhombic; they are usually very perfectly developed and present great variety of form. The simplest crystals are rhomb-shaped tables bounded by the two faces of the basal pinacoid (c) and the four faces of the prism (m); the angle between the prism-faces (mm) is $78^\circ 23'$, while that between c and m is 90° . The mineral has a very perfect cleavage parallel to the faces c and m , and the cleavage surfaces are perfectly smooth and bright. The crystals may be transparent and colourless, or white and opaque, or of a yellow, brown, bluish or greenish colour. The mineral occurs also in a granular, earthy or stalactitic condition. It is known as "cawk" in the Derbyshire lead mines. Barytes is of common occurrence in metalliferous veins, especially those which yield ores of lead and silver.

Commercially, barytes is used in the preparation of barium compounds, as a body for certain kinds of paper and cloth and in gramophone records, as a white pigment ("permanent white"), and as an inert body in coloured paints. (L. J. S.)

BARYTOCALCITE, a rare mineral found only in the neighbourhood of Alston, in Cumberland, where it occurs as diverging groups of white transparent crystals in veins of lead ore. The crystals belong to the monoclinic system and are usually prismatic or blade-shaped in habit. The hardness is 4, and the sp. gr. 3.65. Chemically, barytocalcite is a double salt of barium and calcium carbonates, $\text{BaCa}(\text{CO}_3)_2$, thus differing from the orthorhombic alstonite (*q.v.*), which is an isomorphous mixture of the two carbonates.

BASALT, in petrology, one of the oldest rock names, supposed to be derived from an Ethiopian word *basal*, signifying a stone which yields iron; according to Pliny, the first basalts were obtained in Ethiopia. In current usage the term includes a large variety of types of igneous rock belonging to the basic subdivision, dark in colour, weathering to brown, and comparatively rich in magnesia and iron. Some basalts are in large measure glassy (tachylytes), and many are very fine grained and compact; but it is more usual for them to exhibit porphyritic structure, showing larger crystals of olivine, augite, or feldspar in a finely crystalline groundmass. Olivine and augite are the commonest porphyritic minerals in basalts, the former green or yellowish (and weathering to green or brown serpentine), the latter pitch-black. Porphyritic plagioclase feldspars, however, are also very common, and may be one or two inches in length, though usually not exceeding a quarter of an inch. Basaltic lavas are frequently spongy or pumiceous, especially near their surfaces; and the steam cavities become filled with secondary minerals such as calcite, chlorite, and zeolites.

Till recent years it was widely believed by continental geologists that the pre-Tertiary basalts differed so fundamentally from their Tertiary and recent representatives that they were entitled to be regarded as a distinct class. For the older rocks the names anamesite, diabase porphyrite, *diabasmandelstein*, or melaphyre were used, and are still favoured by many writers, to indicate varieties and states of more or less altered basalts and dolerites, though no longer held to differ in any essential respects from the better preserved basalts. Still older is the term *trap*, which is derived from a Swedish word meaning "a stair," for in many places superposed sheets of basalt weather with well-marked step-like or terraced features.

In the early years of the 19th century a great controversy convulsed the geological world as to the origin of the older basalts or "floetz-traps." Werner, the Saxon mineralogist, and his school held them to be of aqueous origin, the chemical precipitates deposited in primeval seas, but Hutton and a number of French geologists maintained that they were really volcanic rocks emitted by craters now extinct (*see GEOLOGY: Historical*).

Minerals of the feldspathoid group occur in a large number of basaltic rocks belonging to the alkaline group: nepheline, analcite, and leucite are the most common, but hauyne is occasionally present. If nepheline entirely replaces feldspar, the rock is known as nepheline-basalt; if the replacement is only partial the term nepheline-basanite is used. Similarly there are analcite and leucite-basalts and leucite-basanites. The nepheline is in small six-sided prisms, and usually cannot be detected with the unaided eye. Even with the help of the microscope nepheline-basalts are not always easy to determine, as the crystals may be exceedingly small and imperfect, and they readily decompose into analcite and zeolites. Most nepheline-basalts are fine grained, very dark coloured rocks, and belong to the Tertiary period. They are fairly common in some parts of Germany and occur also in Tripoli, Asia Minor, Montana, Cape Verde Islands, etc. Leucite-basalts contain small rounded crystals of leucite in place of plagioclase feldspar. Rocks of this group are well known in the Eifel, and other volcanic districts in Germany, also in Bohemia, Italy, Montana, Java, Celebes, etc.

The distribution of basalts is world-wide; and in some places they occur in immense masses, and cover great areas. In Washington, Oregon, and Idaho many thousands of square miles are occupied by basaltic lava-flows. In the Sandwich Islands and Iceland they are the prevalent lavas; and the well-known columnar jointed basalts of Skye, Staffa, and Antrim (Giant's

GOthic, SARACENIC, JAPANESE, ENGLISH GOTHIC, ARCHAIC GREEK, BY PERMISSION FROM SIR BANISTER FLETCHER'S "HISTORY OF ARCHITECTURE ON THE COMPARATIVE METHOD," EIGHTH EDITION, 1898 (BATSFORD); ENGLISH GOTHIC, FROM GARDNER, "GUIDE TO ENGLISH GOTHIC ARCHITECTURE" (CAMBRIDGE UNIVERSITY PRESS); ROMAN (TUSCAN), ROMAN (TEMPLE OF SUN), ROMAN (TUSCAN), ROMAN (FROM A ROMAN TEMPLE AT PASTURN), ROMAN (DORIC), ITALIAN RENAISSANCE, FROM BUEHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF AND HELBURN); GREEK (ERECHTHEUM), FROM D'ESPLOY, "FRAGMENTS D'ARCHITECTURE ANTIQUE" (MAGNIN); AMERICAN (FLAG-POLE), BY COURTESY OF "ARCHITECTURE"; GREEK (CORINTHIAN), ROMAN (TEMPLE OF VESTA), GREEK (INNER PROPYLEAE), GREEK (TEMPLE OF APOLLO, PHIGALEIA), GREEK (TEMPLE OF DIANA, PROPYLEAE), ROMAN (STOA OF NABRIAN, ATHENS), ITALIAN RENAISSANCE, FROM BUEHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF AND HELBURN); ROMAN (PORTICO OF OCTAVIA) FROM D'ESPLOY, "FRAGMENTS D'ARCHITECTURE ANTIQUE" (MAGNIN)

Causeway) form a southward extension of the Icelandic volcanic province, with which they are connected by the similar rocks of the Faeroe Islands. In the Deccan in India and in western Victoria great basaltic lava fields are known; and Etna and Vesuvius emit basaltic rocks. Liquid of essentially basaltic composition is now commonly regarded as the parent magma from which the greater number of igneous rock types is derived (See PETROLOGY.) (C. E. T.)

BASANAVICIUS, JONAS (1851-1927), Lithuanian statesman, was born in the province of Suwalki in 1851 and educated at Mariampol. He then proceeded to Moscow university, where he studied philology, history and medicine. His name was particularly associated with the famous journal *Ausra* (Dawn), which he issued in East Prussia and smuggled into Lithuania during the last decades of the 19th century. In 1885, however, he was obliged to leave Germany and for many years practised as a doctor in Bulgaria. In 1905, after the Russian Revolution, he was unanimously elected president of the famous Diet of Vilna. He was equally famous as a scholar, and was especially interested in Lithuanian folk-lore. He has been styled the "Patriarch of the Lithuanian Renaissance."

BASAWI: see CASTE.

BASCOM, JOHN (1827-1911), American educator and philosophical writer, was born at Genoa (N.Y.), on May 1, 1827. A graduate of Williams College and the Andover Theological seminary, he taught at Williams, and at the University of Wisconsin, of which he was president from 1874 until 1887, thereafter returning to Williams. He retired in 1903 and died on Oct. 3, 1911, at Williamstown (Mass.). Among his publications are: *Aesthetics*

(1862); *Philosophy of English Literature* (1874); *Problems in Philosophy* (1885); *The New Theology* (1891); *Social Theory* (1895); *Growth of Nationality in the United States* (1899); and *God and His Goodness* (1901)

BASE. (1) An adjective meaning low or deep, and, so, mean, worthless, or wicked (Fr. *bas*, Late Lat. *bassus*, low). (2) A term for a foundation or starting point, used in various senses; (Gr. *basis* "stepping," and so a foundation or pedestal); in sports, as in baseball; in geometry (*q v*), the line or face on which a figure or solid stands; in crystallography (*q v*), as in "basal plane"; in surveying (*q v*), in the "base line," an accurately measured distance between the points from which the survey is conducted; in heraldry (*q v*), in the phrase "in base," applied to any figure or emblem placed in the lowest part of a shield. In chemistry (*q v*), the term denotes a substance which combines with an acid to form a salt (see ALKALI).

Base, in architecture, the lowest visible member of a column or pier. On it the shaft rests. Originally, when wooden posts were commonly used, the base served the function of keeping the wood away from the floor or ground and distributing its weight over a large foundation, thus increasing the stability of the whole. In masonry columns it similarly spreads the load. Although the base is rigidly simple in Egyptian work, and is missing in the Greek doric order normally, it is, elsewhere, universally moulded or otherwise decorated. A base course or ground table is a similar projecting feature, running around the bottom of a wall.

In military language, it is the locality where main depots of supplies, ammunition, war material and reinforcements of personnel are established, and where a line of communication with the field army originates. An "advanced base" is the locality in

which are situated the advanced depots of ammunition, supplies and other stores which form a link between the base and the fighting troops, and from which issues are made direct to formations, field depots and dumps.

BASEBALL (so called from the bases and ball) is a game played by two teams in which a ball, bat and bases are employed. It is the national sport of the United States where it originated. Next to the United States and Canada baseball is more popular

BY COURTESY OF EWING GALLOWAY

A BASEBALL GAME AT THE POLO GROUNDS, HOME OF THE NEW YORK "GIANTS"

Looking toward home plate from right field with a player on first base and a man up to bat. If the batter hits the ball the pitcher is preparing to throw, he will run to first base and the player already there will attempt to reach second base. Notice the "dugouts" where players await turn to bat, and substitute players watch for a call to enter the game

in Japan than elsewhere. The countries of Europe have been less attracted to it than those of Asia, although there are scattered baseball organizations in the British Isles, France, Holland and Australia.

Origin of Game.—The origin of the game was long disputed because of its resemblance to rounders, a game originating in Great Britain, and its similarity to modifications of games in the United States grouped under the common designation of Town Ball, and to "One Old Cat," "Two Old Cat," "Three Old Cat," and "Four Old Cat." These contained rudiments of baseball "Four Old Cat" was played with four bases. Because of many disputations a thorough investigation into the origin of the game was instituted by Albert G. Spalding, who had been one of its first expert players. This included investigation of meagre publications of facts developed in the latter part of the 19th century and also personal evidence. A commission, of which Col. A. G. Mills, a leader in U.S. amateur sports, was chairman, decided that Col. Abner Doubleday (afterwards a general in the U.S. army) devised the diagram of bases and positions for players in 1839, thus becoming the inventor of baseball. His fixture of base locations and distances between bases has never been changed. In the games of "cat," which were played prior to baseball, it was necessary to bat, run and touch a base, or bases. The number of bases to be touched depended upon whether it was "One Old Cat," "Two Old Cat" or "Three Old Cat." A run was scored when the batter touched an outlying base, retraced his steps and regained the batsman's base, or "home-plate," as it later became known in baseball. "One Old Cat" could be played with three players, but more enjoyably with four or more. In "Two Old Cat," in "Three Old Cat" and in "Four Old Cat" the number of players could be increased to 10, 12, 14 or more. No organized teams played, nor were sides formally chosen. The object of the game was to "stay in" as batsman as long as possible, runs being considered merely an accessory to "staying in."

From this primitive method of "bat the ball, run and tally" developed the game of Town Ball, in which the selection of teams upon the field, or competition of sides previously agreed upon or chosen, engendered the method of team competing against team. Thus when baseball was devised by Col. Doubleday, the fact of team competition had been determined in Town Ball. The Olympic Town Ball club was organized in Philadelphia in 1833. This appears to be the first team of that character assembled in

the United States. Town Ball was played with a field diagram laid out as a perfect square with four corners, or goals, each of them about 60ft. apart. The batsman's position was half way between the 1st and 4th goal. The catcher was back of the batsman and outside the square. There were no batted foul balls, and it was considered to be expertness on the part of the batsman to deflect the ball back of him.

The playing field devised by Col. Doubleday is diamond-shaped. The bases are 90ft. apart. The ball is foul if batted outside the diamond or outside its lines indefinitely prolonged from home base, the batsman's stand, to the farthest limits of the playing area. The pitcher's position is equally distant between 1st and 3rd base, although not half way between 2nd base and home plate. Because Town Ball, also known as Round Ball, was thought by some to be the newly invented game of baseball, two entirely different games became identified with the name of baseball. In 1845 the Knickerbocker baseball club of New York drew up the first code of rules for baseball. The first match game of record was played under these rules between the Knickerbocker club and a picked team which, for this game, called itself the New York club. The game was played at Hoboken, N.J., in 1846. Games were played by the Knickerbockers in matches with the Gotham, Eagle and Empire clubs of New York city, and with the Excelsior, Atlantic, Putnam and Eckford clubs of Brooklyn, then a separate city from New York. There were other clubs than these.

From 1845 until 1854 baseball was played by the code of rules first written for the game. In 1854 there was a revision which provided specifications for the size and weight of the ball. On March 10, 1858, the first attempt was made at organization of clubs, their number having greatly increased and the game having expanded throughout the territory about New York city, extending to Philadelphia. Massachusetts still played Town Ball. In 1859 Washington, D.C., organized a baseball club followed in 1860 by Lowell, Mass., Allegheny, Pa., and Hartford, Conn., also organized clubs that year. From that time the game became more widespread, going to Maine, Kentucky, and in 1866 to Portland, Oregon. Baseball was played in towns and hamlets other than the cities mentioned during this period, but the clubs were considered to be town or minor clubs as against organized clubs, a distinction which has followed the progress of professional baseball since.

The National Association of Baseball Players, organized in 1858, embraced 16 clubs in New York city. W. H. VanCott was its president. The Knickerbocker playing rules were amplified, and the ball and bat were made to conform to measurements approximating those of the present day. In 1863 the rules were further amplified. From 1861 to 1865 baseball languished except in the armies of the Civil War. In 1865 a convention was held in New York at which 91 clubs were represented, including the cities of St. Louis, Chattanooga, Louisville, Washington, Boston and Philadelphia. It was strictly an amateur organization without schedules for games, and its purpose was to preserve the stability of the rules and the amateur status of the sport.

In 1865 and 1866 professionalism began to make its appearance. Players did not derive their livelihood from baseball, but the more expert accepted sums of money as members of any club that would engage them for occasional games. This was a new development, somewhat unexpected, and it seriously perturbed the equanimity of the amateur players. Gentlemen players of baseball openly avowed their objection to what they expressed in caustic language as deterioration. In addition to the disposition of some players to accept hire for their services, open pool-selling and bribery by gamblers, some of which was successful, outraged the better element among players and organizers of clubs. This conflict between amateur and professionalism eventually led to a professional organization, the first of its kind, and a puny affair compared with the later great associations of clubs in leagues.

In 1867 the Nationals of Washington, under the lead of Arthur Pue Gorman, afterward U.S. senator from Maryland, made the first trans-Allegheny tour. The team went as far west as St. Louis. In that year the Rockford, Ill., club began the practice

of paying salaries to some of its players. In 1868 the Cincinnati team was organized on what were known as semi-professional lines, a characterization of athletes peculiar to the United States. A semi-professional does not play baseball for a living, but is hired in occasional games. In 1869 the Cincinnati team was hired as an outright professional organization, and made a successful tour of the United States from New York to San Francisco. The Cincinnati team did not lose a game that year and was undefeated until midsummer of 1870. During the successful career of the Cincinnati team rival clubs became imbued with an eager desire to win from it, throwing aside all restraint of policy relative to being amateurs in order to engage the best players available. Every attempt was abandoned by most of the important clubs to preserve an amateur standing, despite the fact that they were members of the National association, which was an amateur body. Once professionalism had entered the game it was impossible to keep the professional and amateur exponents of the sport reconciled. The organization of the professional Cincinnati team was followed by that of another professional team at Chicago, and in 1870 the National Association of Baseball Players was disrupted, the pure amateurs withdrawing from the annual meeting. A new amateur organization was effected in 1872 but died in 1874, the last of the concerted attempts to keep the control of the game within amateur influence. In 1871 the National Association of Professional Baseball Players was organized in New York. This embraced the Athletics of Philadelphia, Bostons, White Stockings of Chicago, Eckfords of Brooklyn, Forest Citys of Cleveland, Forest Citys of Rockford, Ill., Haymakers of Troy, N.Y., Kekiongas of Fort Wayne, Ind., and Mutuals of New York. The affairs of the organization were loosely conducted. The circuit was not preserved intact. Many scheduled games never were played. Gambling and contract breaking became so repulsive to players of higher principle and to certain owners that they withdrew. The association dissolved in 1876 when the National League came into existence with the seceders from the association back of it. It was organized in New York city, Feb. 2, 1876, with a membership made up of the Athletics of Philadelphia, Hartford, Conn., Boston, Chicago, Cincinnati, Louisville, Ky., St. Louis and the Mutuals of New York city. It is the oldest body of associated sport in the United States.

The first president of the league was Morgan G. Bulkeley, afterward governor of Connecticut and also U.S. senator from that State. He served one year and was succeeded by William A. Hulbert, commended everywhere by baseball followers because he expelled from baseball for life four ball players found guilty of dishonesty. From this time confidence was established in the professional branch, and amateur baseball grew with the revived interest in professional baseball. Hulbert remained president of the league until his death in 1882. During his administration baseball had sufficiently developed to be regarded as an institution. Col. A. G. Mills, one of the most notable athletic authorities in the U.S., afterward prominent in the Olympic games, was elected president of the league in 1883. He resigned in 1885. Nicholas E. Young was elected to succeed him in 1885 and held office until 1903. Presidents in succession since then have been Harry Clay Pulliam, Thomas J. Lynch, John K. Tener, former governor of Pennsylvania, and John A. Heydler.

In 1882 the American Association was formed in cities not members of the National League circuit. National League owners attempted to equalize salaries of players regardless of cities and local conditions, by a uniform scale of hire. The players opposed it, and in 1890, after forming a league known as the Players' League, took the field against the National League. In one year the player organization was wrecked. The American Association engaged in open rivalry with the National League in 1891, a venture hopelessly destined to failure, and in the winter of 1891 was merged with the National League into a 12 club organization having a monopoly of major league baseball. It continued to 1900 as the National League when its membership was reduced to eight clubs. The league thereupon became composed of the cities of Boston, New York, Brooklyn, Philadelphia, Pittsburgh, Chicago, St. Louis and Cincinnati, and has so remained.

In 1900 Charles A. Comiskey, owner of the St. Paul club of the Western League, obtained permission to place a club in Chicago. The National League had abandoned Baltimore and Washington, and the Western League, seeking to expand, changed its name to the American League and asked permission to enter those cities. This was refused by the National League. Thereupon the American League declared independence of the National League and took the coveted territory and also invaded St. Louis, Philadelphia, Boston and New York. The newer organization became a rival of the National League with a following equally as great. B. B. Johnson was president of the American League from its first year until the summer of 1927, when he resigned.

Three tours have been made abroad under the auspices of baseball organizers in the United States. The first was in 1874 when players of the Boston team and the Athletics of Philadelphia went to England and Ireland, playing in cities of both countries. In 1889 the Chicago-All America world tour was organized by A. G. Spalding and travelled from Chicago to San Francisco, played in Australia, Colombo, Ceylon, Egypt, Italy, France, Scotland and Ireland. In 1913-14 there was the Comiskey-McGraw tour which played games throughout the United States, thence to Japan, China, the Philippines, Colombo, Ceylon, cities of Egypt, capitals of the continent, Great Britain and home.

Amateur baseball is played universally throughout the United States. There is no authentic census to be had of the players who follow it, but there is barely a hamlet in the country that has not its baseball nine. In scores of towns and cities there are local leagues patterned upon the methods of the major leagues. The members of these city leagues play for amusement and not always for a share of gate receipts. The playing rules of the game as used by the professionals are followed by the amateurs without demur.

Modern Government of Baseball.—The classification of baseball is divided into major and minor leagues. There are two major leagues, each of which has its own organization. There is no fixed limit to the number of minor leagues. All minor leagues are controlled by one association and subscribe to general rules. The two major leagues have eight clubs each. Boston has one club in each major league; so also have New York, Chicago, St. Louis and Philadelphia. Washington, Pittsburgh, Brooklyn, Cleveland, Cincinnati and Detroit each have one club only. Minor leagues are grouped in classes dependent upon the size of the population of the cities in that territory which they include. The highest class is AA. From that they range downward to Classes A, B, C and D.

"Organized Baseball" in United States is the general designation given to associations of professional clubs which are merged into leagues under one administration and executive. Organization became necessary to protect club franchises which are based on territorial monopoly, and also to protect investments in players. The player-holding is a peculiar self-asserted right of a corporation or party of the first part to what are called the artistic or playing rights of the party of the second part, invariably an individual. Prior to the formation of clubs into leagues it was common for rival owners to hire players away from each other, even during the playing season. Clubs were occasionally arbitrarily dispossessed of their franchises, losing all or nearly all of their investment. In 1879 Arthur H. Soden of Boston effected the adoption of a resolution by the National League by which five players of each club might be named who could not be approached for hire by any other club of the league. This was the beginning of the reserve rule which was amplified in 1883, when Col. A. G. Mills brought about a national agreement between leagues and increased the reserve limit to 11 players. The reserve limit was later increased so that 40 players may be reserved by each major league club, and fewer by each minor club depending upon classification. The reserve rule, with its extraordinary assumption of perpetual equity in the player's services, binds him whether or not he signs a season's contract. If a player does not agree with a club as to salary for a season he must remain idle unless the club makes other provision for him. A player reserved by a minor league club may be drafted by a club of

higher classification. Any player's services may be transferred from one club to another by the sale of his contract without his consent. With the reorganization of baseball in 1921 an optional clause was inserted in the player contract by which a certain sum gives the club right to re-engage the player a succeeding year. Every player must be paid his salary in full, if it has been earned, by the club which engages him or that to which he may be transferred.

The National League, after a bitter resistance in the fight with the American League, admitted that it had been worsted, and signed a new national agreement in 1903. The greatest era of prosperity for baseball set in with that year. The new agreement contained the best features of the old. The minor leagues were granted permission to regulate their own affairs through an organization of their own, known as the National Association. The new agreement further established the National Commission, a final court of resort for all organized baseball and a new system of government. The commission was composed of three members, the president of each major league and the third selected by these two. This third member was also the commission's chairman. The president of the National League, Harry Clay Pulliam, and of the American League, B. B. Johnson, elected August Herrmann, president of the Cincinnati Baseball club of the National League, to become the first chairman of the National Commission.

In 1905 a formal post-season series of match games, known as the World Series, was established between the championship clubs of each major league. The rules for this series were formulated by John T. Brush, president of the New York National League club, assisted by John B. Foster, and when adopted by both leagues became known as the "Brush rules to govern World Series." Prior to 1905 there had been post-season series which were called World Series. None of these earlier series was under joint league control and jurisdiction. The establishment of the new National Commission paved the way to place the World Series under its authority. Its success has been one of the most remarkable developments of professional baseball. The first series under the Brush rules was of five games played alternately in Philadelphia and New York between the Athletics, American League champions, and the New York Giants, National League champions. It was attended by 91,273 persons. The attendance since then has been more than 280,000 persons for seven games, the limit of the series. The team first winning four games is the immediate winner, and receives the greater share of the players' prize pool. The total receipts for the series in 1905 were \$68,435. Since then they have exceeded \$1,000,000 more than once. A percentage of gross receipts is first deducted for the Advisory council. Sixty per cent. of the remainder is deducted for the players, and the balance is distributed between owners of the rival clubs and the rival leagues. The minor leagues have imitated the major leagues with a post-season series between their championship teams, one being held by the Class AA organizations and one by the Texas League and the Southern Association, the latter called the Dixie Series.

Decisions rendered by the National Commission after a few years in office provoked another controversy in baseball. The National Commission was abolished, and in place of it there came into existence a one-man authority centred in Kenesaw Mountain Landis, a Federal judge, who was elected commissioner of baseball with jurisdiction over all clubs and all leagues. To act in consultation with him an Advisory council was named composed of Landis, Johnson, president of the American League, and Heydler, president of the National League. Shortly after being installed in office Commissioner Landis objected to criticism of his office which was asserted to have been made by Johnson and did not call further sessions of the Advisory council. In Oct. 1927, the American League accepted the resignation of Johnson as president and in the following month Ernest Sargent Barnard, who had been president of the Cleveland Baseball club of the American League, was elected to the presidency of the American League. Final authority and decision are vested in Commissioner Landis.

*** How to Play Baseball.**—The game of baseball is played by two teams. Each strives to make more runs than the other in nine innings, which are the subdivisions of each game. Baseball may be played on any smooth level field which is about 400ft. on each side. Boys may play on a smaller field, and some of the larger professional grounds have playing areas that are not more than 260ft. in length between home-plate and the nearest barrier, which is the wall of a stand for spectators. When played on a field that is considerably smaller than the official measurements, special rules, known as ground rules, are agreed upon.

In laying out the field for play powdered chalk, or a similar substance, may be used to mark out the diamond. It is best first to designate a point distant about 30yd. from one corner of the field. This point is the home plate or home base. This base is the only five-sided base on the field. Two of its sides extending along what are known as the base lines, are each 12in. long. Its front surface facing the pitcher is 17in. wide. From the home plate extend a line to the right for 90ft. at an acute angle toward another corner of the playing area. At this 90-ft. point the first base is located. Extend another line from the home-plate to the left toward another corner of the playing area for a distance of 90ft. This locates the third base. Then extend a line from the centre of the home-plate and through the centre of the diamond for a distance of 127ft. 3½in. This establishes the fourth corner of the diamond and locates the second base. Each base except home is a white canvas bag, 15in. square, filled with sand. The chalk lines leading from the home plate to first and third bases are called the base lines. They are prolonged indefinitely beyond first and third bases to the limits of the playing area. They divide foul ground from fair ground. All ground between these lines and of which the second base is approximately the centre, is fair ground, which also continues indefinitely outward from second base. That part of the playing area within the lines extending between bases is called the infield, and that part of it extending outward from second base and from the lines running between first base and second base, and second base and third base, is called the outfield. The term "diamond" often is applied to the playing area as a whole; sometimes to the infield only.

Each team in a baseball game is composed of nine players. One of these teams takes its turn at bat while the other takes

"BABE" RUTH IN BATTING POSITION, AWAITING BALL FROM PITCHER

the field and endeavours to put out three players of the batting side so that an inning at bat may be completed. The team in the field takes its turn at bat when three of the batting side are out and the team that had been at bat goes to the field. This alternating process continues until nine full innings have been played. If the side that has been in the field at the end of the eighth inning is in possession of more runs than the side that has finished its time at bat in the first half of the ninth inning, the game is over, as there is no reason to play the last half of the ninth inning. If there is a tie at the end of nine innings the game is continued until one side or the other may win or until it is necessary to adjourn it for lack of light or because of storm. A game thus terminated is drawn. A player may be substituted for another at any time on either team and there is no limit to substitutions. But a player once out of the game may not return to it, except by the permission of the captain of the opposing team. To score a run a player must legally touch each base beginning with first base, then second and third, to home plate again. If the side is put out before a player can score he is "left on base" and receives no credit for the distance that he may have advanced.

The Players.—The fielding side consists of the pitcher and catcher, sometimes called the battery, first baseman, second baseman, third baseman and short stop, called in-fielders, and left fielder, centre fielder and right fielder, called out-fielders.

The pitcher delivers the ball to the batsman. He may throw overhand or underhand. In the act of pitching he must keep one foot in contact with a white plate called the pitcher's plate, 24in. long and 6in. wide, which is 60ft. 6in. from the apex of the home base on a direct line towards the second base. Before 1875 the pitcher was obliged to deliver the ball with a forward toss only, something like the delivery of a ball on a bowling alley. Unexpected speed was developed with this archaic motion, and because

BY COURTESY OF MESSRS. A. G. SPALDING AND BROS.

THE PROFESSIONAL BASEBALL BAT IS OF ELASTIC WOOD, 34 INCHES LONG, AND TAPERS TO A DIAMETER CONVENIENT FOR THE HAND TO HOLD

it was found that speed could be increased by an underhand throw, which was the evolution of the toss, underhanded pitching was soon legalized. The overhand throw followed as a matter of course. In 1867 William Arthur Cummings developed the curve ball. This inaugurated the most radical departure in pitching in the history of baseball. The most common and most used curve is the out-curve. The ball, delivered by a right-handed pitcher, proceeds on a straight line towards the batsman until almost within reach of his bat when it suddenly swerves and twists away from him, if he be a right-handed batter, or toward him, if he be a left-handed batter. The reverse is true with a left-handed pitcher. This curve is caused by a strong twist being given to the ball by the wrist of the pitcher as the ball leaves the pitcher's hand from between the first or index finger and thumb. There is no in curve. Many pitchers throw a ball with a pronounced in-shoot, but none has been able to develop a pronounced "break" (another name for curve) to the ball as in the out-curve. There is a drop ball which proceeds on a straight line from the pitcher toward the batter and then suddenly descends toward the ground. There is also what is known as the raise ball which is started close to the ground and sails upward with an out-curve motion. There is what is known as the knuckle ball, in which the knuckles of the pitcher's hand play a prominent part in giving the ball erratic motion; the screw ball, which, to the batter, has a seeming zigzag motion; the fork ball, in which the first and second fingers of the hand exercise a peculiar grip on the ball, and other varieties. Change of pace on the part of the pitcher, that is, ability to pitch both a fast and a slow ball with a similar motion, is essential in modern baseball. For every ball that is pitched over any part of the home-plate between the shoulder and knee of the batsman, the umpire may call a strike if the batsman declines to swing at the ball. A ball pitched at the proper height but not over the plate, or one pitched below the knee or above the shoulder, is a called ball. The batter is allowed three strikes and is out if he misses the third strike and the catcher holds the ball. If the umpire calls four balls the batter may go to first base in safety. The pitcher ordinarily will dispose of the batter within a maximum of six thrown balls or send him to first base. The pitcher, while in position on his plate, may not make a motion to deliver the ball to the batsman without actually throwing it, or to throw to first base, while that base is occupied by a runner, without completing the throw. If he violates this he is said to have made a balk. Each base runner may advance a base if the pitcher balks, but the batsman may not go to first base. In addition to his duties as pitcher the pitcher is also a fielder, stopping batted balls and throwing out the batsman and occasionally covering first base whenever the baseman must leave his base to make a fielding play.

The catcher stands behind the home-plate and the batter, and must be within a ten-foot radius of the home-plate when the ball is delivered to the batsman. The pitcher throws to the catcher and endeavours not to let the ball strike the ground. The catcher has the most important position on the field as the playing of the game is always in front of him. In addition to catching the pitched balls he often fields short hits, called bunts,

to the first baseman and catches high foul flies which otherwise might fall a considerable distance to one side or back of him. It is his duty to try to prevent base runners from advancing a base after the ball has been delivered to him by the pitcher. Hence he must be a very strong, powerful and accurate thrower. Often the catcher by an adroit throw will catch a runner off a base. When this happens the runner is said to be "napping." The catcher also assists the pitcher in catching runners "napping" by a system of signals between them. The catcher, by signs which may be of any nature, but are hidden and presumed to be unintelligible to the batting side, gives directions to the pitcher as to what the latter shall throw to the batsman. When the catcher assumed his position directly back of the batsman in modern baseball (he once played far back) he did not wear the heavy glove on his left hand, a chest protector which is inflated with air, the wire mask over his face, and shin guards. These have been considerably provided for his safety. Expert catchers, except in rare instances, are right-handed.

Every batsman upon hitting a ball must run for the first base. If the ball is batted on the ground it may be fielded and thrown to first base. For that reason the first baseman must be a sure catch of a thrown ball. As the first baseman may also field a ball batted in his direction and then run and touch the base he must be an accurate fielder. A tall man, if agile, naturally is preferable for a first baseman, but men of medium height play the base with great skill. The second baseman usually plays back of the base line between first and second bases. He may choose any place in that area which he deems best for his success. He fields the balls batted toward him whether grounders, line hits or flies. He must also be ready to cover second base whenever a runner tries to advance, or steal, from first to second base. The short stop occupies almost a similar position between second base and third. His duties are identical with those of a second baseman, and he shares with him the responsibility of covering second base to put out base runners. The short stop has a longer throw to make to the first baseman on most of the balls batted toward the short stop's position. He must be a quick and accurate thrower. It is also his duty to back up both the second baseman and the third

DETAIL SHOWING CORRECT GRIP ON THE BAT FOR A LEFT-HANDED BATTER. THIS BATTER IS ALL BUT FACING THE PITCHER

A GOOD BATTING STAND, VIEWED FROM THE SIDE. THIS BATTER IS STANDING SIDEWISE TO THE LINE OF THE BALL'S FLIGHT

baseman when he can do so. The short stop may be called the "Handy-Andy" of the infield.

The third baseman fields ground balls, as do the other basemen, and short stop, and his throw to the first baseman is usually the longest of all on the infield. Batsmen become very adept in tapping the ball a short distance toward third base, and a third baseman must be very active and alert on his feet in order to run forward, pick up the ball and throw the batsman out before he reaches first base. These bunt hits, as they are called, at times are fielded by the pitcher or catcher. This is made necessary because the third baseman is compelled to play very close to his base when there is a runner advancing toward it from second base.

The outfielders roam back and forth, and in and out at will, to catch such long fly hits as are batted into their territory. It is their duty so to place themselves as to be in proper position for certain batters who have a propensity to bat the ball in one general direction. It is also the duty of the out-fielders to be ready always to field such batted balls as pass between the infielders to the out-field and to back up the basemen when the ball may be thrown to them to try to put a runner out, or to recover the ball if it has been batted and has passed an in-fielder. Teamwork in baseball makes it imperative that each player must know when to "back up" or come to the support of another player. The out-fielders must be very good throwers, as they

IN BUNTING THE BALL, THE BAT IS HELD HIGHER THAN USUAL. ORDINARILY A BATTER IN BUNTING HOLDS THE BAT OUT AND HITS THE BALL WITHOUT STRIKING AT IT. IN SUCH A PLAY THE BATSMAN STARTS TO RUN A SECOND OR SO BEFORE BUNTING

are often required to throw to the home-plate from long distances to try to put out runners who are endeavouring to score. If the catcher is standing near the home-plate ready to receive such a throw, the pitcher and even the first baseman may run in back of the catcher to "back up" the thrower. The captain of the team, or some other player designated, usually calls the name of the player who is to catch a fly ball. This is especially necessary for the out-fielders who run at top speed, two or three of them trying for the ball, and who are in danger of collision unless there is someone to call out which player shall make the catch.

On either side of the home-plate a parallelogram, marked with chalk, 6ft. long and 4ft. wide, is drawn. The batter stands within one of these. Each is called a batter's box. If he oversteps the box and at the same time bats the ball, he is declared out. The object of the batsman is to get to first base without being put out. He may do this in several ways: (1) He may make a base hit, which is a batted ball in fair ground that cannot be caught or fielded to first base in time to put him out; (2) he is entitled to first base if the umpire calls four bad balls at none of which the batter has struck; (3) he is given first base if struck by a pitched ball unless the umpire decides that the batter did not attempt to get out of the way; (4) if the catcher fails to hold the third strike the batter is safe at first base if he can reach it before the catcher can throw the ball to the first baseman, and the first baseman, with the ball in his possession, touch first base; (5) the batter may reach first base by a mis-play of some fielder, which may be a muffed fly, a failure to field successfully a ground ball, a muffed thrown ball or a bad throw. Fair batted balls are only those which are batted within fair lines. Foul balls are all others than fair balls. The batsman is not compelled to run on them. Until two strikes have been called by the umpire, foul batted balls are called strikes, under the provision of the foul strike rule, a modern innovation of the game.

The more clever batsmen try to place the ball to a certain part of the field. Bunting the ball is the act of tapping it slowly for a short distance toward either first or third base, as closely to the baseline as possible. It is an acquired art as there are very few natural bunters. The batter endeavours to make a safe hit by

striking the ball between the fielders or batting it so hard that a fielder cannot handle it successfully. In the latter case the fielder is not given an error. "Error" is the technical name used by the scorer for a mis-play and is charged against the fielder who makes it. The judge of a mis-play is the official scorer. The batsman may also hit safely by placing the ball over the heads of the infielders or out-fielders. A hit by which the batsman makes two bases, the ball being handled without error, is a two-base hit or a two bagger, one for three bases a three-base hit or three bagger, and one for all the bases, a home run. There are many ways in which the batsman may be put out: (1) He is out if he fails to bat in the regular order given to the umpire by the captain of his team; (2) if he fails to take his position within one minute after being summoned—this rule is seldom enforced, it being one intended more for discipline than anything else; (3) if he makes a foul fly hit and the ball is caught before it strikes the ground. A foul tip, which is a pitched ball grazed by the bat, barely deflected in its course and caught by the catcher, is a strike; (4) if he wilfully obstructs or interferes with the catcher; (5) if he misses the third strike and the ball is caught by the catcher. If the ball hits his person on the third strike he is out. If the catcher drops the ball and throws it to first base where it may be caught by any fielder before he gets there, he is out; (6) if a foul or fair hit fly ball be caught before striking the ground; (7) if any fair hit ground ball is fielded to the first baseman who touches the bag before the batter arrives at the base. If the batter steps out of the batsman's box and meets the ball he is not out if he does not strike the ball.

The moment the batsman has batted a fair ball he becomes a base-runner and must start for first base. He may overrun this base if he desires to do so. He may turn in either direction without being put out, but if he shows intent to go to second base he forfeits his right to return to first base without being put out. After he has once reached first base he may be touched out with the ball in the hands of a fielder, unless some part of his person is in contact with a base. When a fair or foul ball struck by a batsman of the runner's side is caught on the fly the runner must retouch his base or be put out if the baseman receives the ball before the runner can get back. A runner on first base is forced to run to second when the batsman hits a fair ground ball. He is not forced to run on a fly hit. If there is a runner on second and another on third, with one on first also, the bases being filled, as it is called, all are forced. This is called "forced off base." When this happens the forced runner can be put out if the ball is thrown to the baseman and held by him on the next base before the runner arrives there. It is not necessary to touch the runner with the ball. If the batsman is given a base on called balls and there is a runner on first base the latter, although forced to go to second base, may do so in safety. A double play is one in which a batted ball is fielded with the runner on first base, tossed to the second baseman, putting out the runner, and then thrown by the second baseman to first base in time to put the batsman out. Occasionally triple plays are made when there are two or three runners on bases.

Base running is one of the most beautiful arts of baseball. If there is a base-runner with intent to steal the next base, as it is called, he tries to gain as much advantage as possible when he is sure that the pitcher is about to deliver the ball. When the base-runner nears that base which he is trying to steal he usually slides into it, if he thinks it necessary. He may slide head foremost or feet foremost. Sliding to bases is done to baffle the baseman who finds it difficult to catch the ball and stoop to touch the runner. A "double steal" means that two runners act in concert, one signalling to the other that he will make the play. Sometimes this double steal is tried when there is a runner on first and another on third, the runner on first deliberately leading off the

CROSS SECTION OF A BASEBALL

Nine inches in circumference, the ball weighs five ounces

base to induce the pitcher to try for him, hoping that the runner on third may be able to elude the fielders and score. A base-runner is out if he interferes with an opponent while the latter is fielding a ball or if the runner is hit by a batted ball.

There are three principal ways to try to advance a runner: (1) If a runner is on first the batsman deliberately bunts, expecting that he may be thrown out himself but making sure that the runner shall advance to second. This is called a sacrifice; (2) the so-called hit and run play, which should be more clearly called the run and hit play, takes place with a runner on first base. The runner gives a signal to the batsman that he is about to start, and the batsman tries to place a hit through that territory which he thinks will be vacated by an infielder. Thus both runner and batsman may be safe; (3) hitting behind the runner takes place when a runner on first base gives a signal that he is about to start and the batter tries to hit the ball through that space between the advancing runner and the base he has just left. The squeeze play is used only to attempt to assist a runner from third base to score. The runner signals to the batter that he will start on the next pitched ball. The batter bunts the ball and the play is often successful. The batter may be safe at first, thus gaining double advantage, or he may be put out. There is also what is known as a sacrifice fly hit. The batter raps the ball so far out that any runner on bases may remain there until the fielder touches it and then advance to the next base. To render it a sacrifice the runner must not be put out. The pitcher may deliberately give a base on balls to the batsman if he desires to do so. But the catcher must not step out of his position while this is being done. If he does a balk is called on the pitcher and all runners may advance. This so-called "intentional base on balls" is a strategic attempt on the part of the pitcher to send a presumably strong batter to first base in order to bring up the next batter on the list.

Two umpires are now used in the higher classified leagues of baseball, and in the major leagues three are used, and in the World Series, four.

Scoring.—Scoring of baseball games is customarily attended to by experts, although the theory of scoring has become so well known that hundreds of spectators keep their own scores. Books are printed containing special diagrams upon which the score is kept. The score is arranged in vertical columns: (1) How many times each player has been at bat (exempting a time at bat for bases on balls and sacrifice hits). This exemption is made to encourage patience at the bat and skill in sacrificing; (2) how many runs each player has scored; (3) how many base hits he has made; (4) how many sacrifice hits he has made; (5) how many opponents he has put out; (6) how many assists he has made. An assist is given to a player whenever he has assisted in putting a player out. For example, if the second baseman picks up a ground ball and throws to first base to put a batter out, he is credited with an assist; (7) how many errors (mis-plays) he has made. Passed balls, which are pitched balls not held by the catcher, are not given as errors against the catcher except in the case of a missed third strike, in which case an error should be scored. Balks and bases on balls are not errors, nor are wild pitches, except that if a pitcher makes a wild throw on the third strike, the batter reaching first base, the pitcher is given an error. In the summary which is provided below the "Box Score," the name given to the vertical column arrangement, are included the long-distance hits credited to each batter, stolen bases credited to each runner, double and triple plays, batsmen struck out by each pitcher, the number of bases on balls given by each pitcher, the number of men struck out by each pitcher, the number of runners left on bases, the time of the game, the names of the umpires, and also the number of runs batted in by each batsman.

Records of Baseball.—The word "record" is not limited to apply to actual individual achievement by player or team, but it is accepted in a general way as a descriptive title for any event in baseball, including history, legislation and executive action, as well as designation of achievement on the field by the player. The following records are considered to be vital to baseball:—

1. The first match game of baseball of record was played at

Hoboken, N.J., June 19, 1846, Knickerbockers v. New York, score 23 to 1, in four hands which were later called innings. 2. The first baseball uniform was worn by the Knickerbocker Club of New York, coloured blue and white, in 1849. 3. The first extra-inning game of baseball (nine innings being the legal limit) was played June 17, 1861, by the Knickerbockers and Washingtons, at New York city, score 22 to 20, innings numbering ten. 4. The ball was first standardized in size and weight in 1854, a rule being adopted that it must be $5\frac{1}{2}$ to $6\frac{1}{2}$ oz. in weight and $2\frac{1}{4}$ to $3\frac{1}{4}$ in. in diameter. This was modified in 1872 by an amendment making the weight of the ball not less than 5 and not more than $5\frac{1}{2}$ oz., with a circumference of not less than 9 or more than $9\frac{1}{4}$ inches. These specifications have not since been changed and are to continue until 1948 except by special order of the major leagues. 5. The first baseball association of clubs was formed in 1858, and the runs made in nine innings were declared an official game as against victory going to the team that first made 21 runs, or aces as they were then called. The rule never has been changed. 6. In 1859 a rule was adopted that no ball player could receive money for his services. This became worthless with the organizing of professional baseball clubs a short time afterward. 7. Albert J. Reach, born in London, England, became the first professional baseball player in 1864. He was engaged by the Athletics of Philadelphia. He also became the first baseball player to be sent to one city by a club in another, Brooklyn releasing his services to the Athletics on payment of a fixed sum. 8. In 1864 Henry Chadwick, born in England, devised the first method of scoring a game, that is, keeping a record of the plays and runs made by each individual and the team. 9. In 1865 the method of computing individual statistics of players was begun. More than 5,000 players are now reported annually by this system. 10. In 1869 the Cincinnati team played all of the season without defeat, winning 81 games. 11. In 1871 the first professional association of baseball clubs was organized, the actual beginning of that which came to be known as "organized baseball." 12. The first game with a 1 to 0 score to be played in organized baseball took place in St. Louis in 1875, Chicago defeating St. Louis. 13. The National League, one of the major associations of baseball in the United States, was organized Feb. 2, 1876. It has existed since then continually, although its circuit of cities has been changed. In 1876 the bat, for the first time, was limited to 42 in. in length. 14. In 1877 the first minor league, as it was classified, its title being International League, was organized. There is now an association of minor leagues embracing cities of all sections of the United States and Canada. 15. In 1882 the American Association was organized to rival the National League, but not in cities occupied by the National League. 16. In 1883 salaries were first paid to umpires. These salaries have since been increased until certain umpires have been paid as much as \$10,000 for the season. 17. The pitching distance was increased in 1893 to its greatest length from home plate, 60 ft. 6 in., where it has since remained. 18. The American League, now the junior league of the major organizations, was developed from the Western League, combined with cities in eastern territory. 19. In 1905 the World Series was first played under the Brush rules and it was provided that the National Commission should have control of the series. 20. In 1921 organized baseball, for the first time, modified its system of government by placing one man at its head to act as court of final resort. Judge Kenesaw Mountain Landis was elected to the office with the title of Commissioner of Baseball. 21. In 1923 the gross receipts for all seven games of the World Series amounted for the first time to more than \$1,000,000, to be slightly exceeded in succeeding seasons. On Feb. 2, 1925, the National League celebrated its 50th anniversary, and in 1926 the National Association, composed of minor leagues, its 25th.

BIBLIOGRAPHY.—See A. G. Spalding, *America's National Game* (1911); F. C. Richter, *History and Records of Baseball* (1914); Spalding's Baseball Guide in Spalding's *Athletic Library* and Spalding's *Little Red Book* (baseball's best records), published annually.

GLOSSARY OF TERMS USED IN THE GAME

The following is not a complete glossary of baseball terms, but a list of those terms in general use and included in the rules.

At bat: Term used to express batter's turn to hit the ball.
Backing up: Playing behind another player to guard against a probable error or to assist in retiring a batsman.
Backstop: Barrier behind the catcher to stop the ball when it passes him.
Bag: Any base except home plate.
Balk: Motion made by pitcher as if to deliver ball without delivering it and which deceives the batter.
Banished: Ruled from the field by an umpire.
Base: One of four points to be touched to make a legal run.
Base hit: Ball batted between fielders or with such force fielders cannot handle it properly to put the batter out.
Base lines or paths: Runways between home plate and first and third, also between second and first and second and third bases.
Baseman: Player who is stationed at first, second or third base.
Base on balls: Calling of four illegal balls by umpire which gives batter right to go to first base without being put out.
Batter: Player at home plate seeking to bat the ball.
Batter up: Player immediately at home plate in proper turn.
Batter's box: Two rectangles, one on either side of home plate, in which batsman must stand to bat the ball legally.
Battery: Pitcher and catcher.
Behind the bat: Position of both catcher and umpire-in-chief.
Bender: Pitched curve ball.
Blocked off base: Runner restrained from getting back to base because baseman's body or some part of it is in the way.
Boxman: Pitcher.
Called ball: One of the balls pitched which the umpire judges not fair.
Called strike: Strike designated by the umpire at which the batter does not swing.
Calling time: Stopping of the game temporarily by the umpire.
Catcher: Player who receives the balls thrown by the pitcher.
Centre field: Position in mid-outfield.
Centre fielder: Player who guards mid-outfield position.
Centre field hit: Hit which goes into centre field territory.
Coach: Man who may or may not be actively in game and, standing at corner of diamond, encourages team at bat.
Crowds plate: Stands as closely to home plate as rules will permit.
Curve: Bend of ball in air as it leaves the pitcher's hand and approaches the batter.
Diamond: Either all the field or the field between bases, more generally the latter.
Dish: Home plate.
Double: Hit for two bases.
Doubled: Batted for two bases.
Double play: Retiring two runners before ball is returned to pitcher and while it is in continuous motion.
Drop or drop ball: Term to describe drop in thrown ball from pitcher to batter.
Error: Mistake in fielding play which is charged to the individual record of the man who makes it.
Extra innings game: Any game in excess of the legal number of nine innings, whether a drawn game or played to a finish.
Fair ball: Any batted ball on fair territory or pitched ball over home plate between shoulder and knee of batter.
Feet first: Sliding to base feet foremost.
Fielder: Any player on the field trying to put batters out.
Firing line: Used to denote the position of pitcher as he is combating the batters.
First baseman: Player stationed at first base.
First strike: First strike called by umpire against the batter whether swung at or not.
Flied out: Batted fly caught by fielder.
Fly ball: Any ball batted into the air.
Foul ball: Any batted ball that remains on foul ground as governed by rule.
Foul fly: Fly ball batted foul.
Foul strike: First and second fouls against batter called strikes.

Four bagger: Home run.
Grounder: Ball batted on ground.
Half inning: Exactly half an inning, or one side out only.
Heavy ball: Thrown ball that seems overweighted to player catching it.
High ball: Pitched ball above the waist of the batter.
Hit safely: Made base hit.
Home plate: Base at first corner of diamond and that also at which batter stands to bat.
Home run or Homer: A hit that permits batter to make circuit of all bases without error being made in handling the ball.
In: The batting session of either nine.
In-curve: Same as inshoot.
Infield: Surface of playing ground bounded by base lines.
Infielder: A baseman, sometimes the pitcher, catcher or short-stop.
Inning: Term at bat of both teams.
Inshoot: Variation of pitched ball toward batter.
Leading off bases: Trying to get a start to the next base while the pitcher still has the ball.
Left field: Outfield back of third base.
Left field hit: A hit toward left field or into it.
Left fielder: Player who guards the territory of left field.
Line drive: Straight hit in the air travelling direct to fielder at minimum height from ground.
Lined to the fielder: Batted directly into the fielder's hands and not on the ground with force.
Long drive: Any long hit beyond the infield.
Moved up: Advanced a base.
Muff: Failure to catch a fly ball or throw.
Muffed fly: Fly uncaught because of clumsiness or poor judgment.
Nine: Players of either team even if more than nine.
Nine innings: Legal period of game.
Ninth inning finish: Fine rally as the game is about to end.
One base hit: Hit on which the batter reaches first base safely and without a contributing error on the part of a fielder.
Out: End of player's term at bat, or end of runner's safety when circling bases.
Outcurve: Curve that turns away from batter on pitched ball.
Outfield: All fair and foul territory back of the base lines.
Over the plate: Ball pitched over home plate, usually referring to one that is also at the right height for batsman.
Overhand delivery: Pitcher throwing the ball with an arm motion straight over the shoulder.
Overrunning bases: Failure to hold base when up to it and after touching it.
Pass: Base on called balls.
Passed ball: Pitched ball that is muffed by catcher and goes back of him.
Pennant: Banner denoting championship team.
Percentage: System by which records of players and teams are computed.
Pitch or Pitched ball: Ball thrown by pitcher to batter.
Pitcher: Player who throws ball to the batters.
Pitcher's plate or Plate: The plate from which the pitcher throws the ball to the batter.
Player: Anyone actively engaged in a game.
Player trapped or pocketed: Runner who is successfully prevented from advancing a base by skill of more than one opposing fielder.
Player's bench or coop: Where members of batting team sit when their team is at bat.
Pulled off base: Runner induced to leave base by strategy of opposing player.
Put out: Any player who has been retired on the batting side; also a technical term to denote a scoring play.
Regular: Player who is named to start in game and is also a constant player on team.
Right field: Outfield back of first base.
Right fielder: Player who guards right field.

Right field hit: Batted ball that goes toward right field or into it.

Run: Circuit of the bases by batter, counting one point for his team.

Sacrifice: Deliberate out on part of batter to advance base runner.

Safety: Base hit.

Score: Tabulated record of the game.

Scorer: The man who keeps the score of the game.

Second base: The base located half-way between first and third.

Second baseman: The guardian of second base.

Second strike: That following the first, and may be called by the umpire if the batter does not swing at a properly pitched and fair ball.

Sent to base: Given a base on called balls or ordered to first base by the umpire because of a penalty against team in field.

Shortstop: The player who guards the field between second and third bases, acting also as second baseman at times.

Shut out: Team retired in game or inning without scoring.

Side-arm delivery: Throwing the ball by the pitcher with the arm horizontal to the body.

Side out: Three hands of the team at bat retired.

Slide: Plunge by base runner along the ground to make the next base or return to one held.

Steal: Obtaining a base against the best defence of the fielders.

Stolen base: Base obtained by runner against the best defence of the team in the field.

Straight-arm delivery: Pitching the ball without crooking the pitching arm appreciably.

Straight ball: Pitched ball without a curve or shoot.

Strike: Penalty called against the batter, who is allowed three strikes by rule. Umpire may call strikes if ball is pitched fair and legally and batter does not swing at it.

Strike out: To be out on three strikes whether called by the umpire or swung at by the batter.

Three-bagger: Batted ball on which the batter can make third base safely against any defence.

Third baseman: Guardian of third base.

Third out: Third player out of the team at bat.

Third strike: Third and last strike called by the umpire or swung at by the batsman, the maximum allowed to each batter.

Three-base hit: Same as three bagger.

Three hundred hitter: One who bats .300 or better, based on a decimal percentage system which establishes records for individuals.

Time at bat: Term of the batter against the pitcher.

Time of game: Actual hours and minutes consumed in play.

Triple: Three-base hit.

Tripled: Made a three-base hit.

Triple play: Putting out three men and retiring side in successive plays before the ball is returned to the pitcher, an unusual feat, very infrequently witnessed by spectators

Two base hit: Same as two bagger.

Umpire: The judge of all plays. There may be from one to three of them.

Whitewash: To put a batting side out without scoring in an inning or to defeat a team in a game without a score by losers.

(J. B. Fo.)

BASEDOW, JOHANN BERNHARD (1723-1790), German educational reformer, was born at Hamburg, the son of a hair-dresser. He received an education at the Johanneum in that town. In 1753 he was chosen professor of moral philosophy and belles-lettres in the academy of Sorö in Denmark. On account of his theological opinions he was in 1761 removed from this post and transferred to Altona, where some of his published works brought him into great disfavour with the orthodox clergy. Towards the end of 1767 he abandoned theology to devote himself with the same ardour to education, of which he conceived the project of a general reform in Germany. In 1768 appeared his *Vorstellung an Menschenfreunde für Schulen, nebst dem Plan eines Elementarbuches der menschlichen Erkenntnisse*, which was strongly influenced by Rousseau's *Emile*. His *Elementarwerk*,

1774, contains a complete system of primary education, intended to develop the intelligence of the pupils and to bring them, so far as possible, into contact with realities, not with mere words. The work was received with great favour, and Basedow obtained means to establish an institute for education at Dessau, which he named *Philanthropin*. Similar institutions sprang up all over the land. Basedow, unfortunately, was little calculated by nature or habit to succeed in an employment which required the greatest regularity, patience and attention; he resigned his directorship of the institution in 1778, and it was finally closed in 1793.

See H. Rathmann, *Beiträge zur Lebensgeschichte Basedows* (Magdeburg, 1791); J. C. Meyer, *Leben, Charakter und Schriften Basedows* (Hamburg, 1791-92); G. P. R. Hahn, *Basedow und sein Verhältnis zu Rousseau* (Leipzig, 1885); A. Pinloche, *Basedow et le philanthropisme* (1890); C. Gössgen, *Rousseau und Basedow* (1891).

BASE FEE, in law, a freehold estate of inheritance, which is limited or qualified by the existence of certain conditions. In modern property law the commonest example of a base fee is an estate created by a tenant in tail, not in possession, who bars the entail without the consent of the protector of the settlement. Though he bars his own issue, he cannot bar any remainder or reversion, and the estate (*i.e.*, the *base fee*) thus created is determinable on the failure of his issue in tail. An example of this kind of estate was introduced by George Eliot into the plot of *Felix Holt*. Another example of a base fee is an estate descendible to heirs general, but terminable on an uncertain event; *e.g.*, a grant of land to A and his heirs, tenants of the manor of Dale. The estate terminates whenever the prescribed qualification ceases. An early meaning of base fee was an estate held not by free or military service, but by base service, *i.e.*, at the will of the lord.

BASE HOSPITAL, a hospital created and used by the Government for the care of the sick and wounded in time of war. Such hospitals are located sufficiently far from the firing lines to be permanent and stationary. The seriously wounded are removed from the various dressing stations at the front to these hospitals. In the United States certain hospitals receiving chronic or seriously wounded soldiers during the World War were called base hospitals.

BASEL, CONFESSION OF. The Reformation was somewhat stormily introduced at Basel in 1529; and in 1531 a Confession was drafted by Oecolampadius, the friend and follower of Zwingli; and adopted in a revised form by the city authorities in 1534, and shortly afterwards by the city of Muhlhausen in Alsace. It is known as the First Confession of Basel (or the Confession of Muhlhausen), and must be distinguished from the First and Second Helvetic Confessions (the former of which is sometimes called the Second Confession of Basel). It gives in 12 articles a moderate statement of the Zwinglian doctrine: declaring, for example, that in the Lord's Supper Christ is present as *the food of the soul* to everlasting life. It held its place in the Church of Basel down to 1872, when its use was discontinued.

See ZWINGLI (with ref.); W. A. Curtis in Hastings, *Dictionary of Religion and Ethics*, s.v. "Confessions," sec. 15; Schaff, *Creeks of the Evangelical Protestant Churches* (5th ed., 1887); Muller, *Symbolik*, pp. 95 ff. (1896).

BASEL, COUNCIL OF. The third of the three reforming councils of the 15th century, after the councils of Pisa (1409) and Constance (1414-18). In these councils the aim of the majority was to destroy the absolute supremacy of the Pope and curb the rule of the Roman curia, in order that the power of oecumenical or general councils and the authority of the episcopate might be re-established. The fathers of Constance succeeded in showing their superiority to the pope by bestowing the papal chair on Martin V. and by insisting that another such council be called in five years. The council called in obedience to this instruction was first appointed to meet at Pavia, then at Siena; but Basel was at last decided upon. At the very beginning Martin died, but his successor Eugenius IV. sanctioned his decrees and the council met in July 1431, under the presidency of Cardinal Julian Cesarini.

The democratic character of the assembly at Basel was the result both of its composition and of its organization; not only was the number of prelates in it always small in comparison with that of the doctors, masters, representatives of chapters, monks or

clerks of inferior orders, but the influence of the superior clergy had all the less weight because, instead of being separated into "nations," as at Constance, the fathers divided themselves according to their tastes or aptitudes into four large committees or "deputations" (*deputationes*), one concerned with questions of faith (*fidei*), another with negotiations for peace (*pacis*), the third with reform (*reformatorii*), the fourth with what they called "common concerns" (*pro communibus*). Every decision made by three of these "deputations"—and in each of them the lower clergy formed the majority—was ratified for the sake of form in general congregation, and if necessary led to decrees promulgated in session.

The principal subjects assigned to the council were the re-union of the Greek and Latin Churches, the reconciliation of the Hussite Bohemians, and the reform of the Church according to the resolutions of Constance. Soon after the opening of the council the Roman curia took alarm at its aims, and by intrigues compelled the pope, who was really anxious for reform, to do all he could to hinder its work. He twice tried to dissolve it; but it resisted, maintaining that an oecumenical council, being superior to the pope, could not be dissolved. Eugenius yielded; and the bishops refused to admit his legates until they admitted the supremacy of the council and promised to obey its decrees.

The first business to which the members addressed themselves was to curb the power of the pope and of the Roman curia. They tried to do this by stopping the flow of money from all parts of Europe to Rome. They abolished the Annates (*q.v.*); they declared it illegal in a bishop to send the sum of money commonly presented on his investiture; and they passed disciplinary measures regulating the elections, the celebration of divine service, the holding of diocesan synods and provincial councils and so forth.

Eugenius, however much he may have wished to keep on good terms with the fathers of Basel, was neither able nor willing to accept or observe all their decrees. The question of the union with the Greek Church, especially, gave rise to a misunderstanding between them which soon led to a rupture. The emperor John Palaeologus, pressed hard by the Turks, showed a great desire to unite himself with the Catholics; he consented to come with the principal representatives of the Greek Church to some place in the west where the union could be concluded in the presence of the pope and of the Latin council. Hence arose a double negotiation between him and Eugenius IV. on the one hand and the fathers of Basel on the other. The chief object of the latter was to fix the meeting-place at a place remote from the influence of the pope, and they persisted in suggesting Basel or Avignon or Savoy, which neither Eugenius nor the Greeks would on any account accept. The result was that Palaeologus accepted the offers of the pope, who, by a bull dated Sept. 18, 1437, again pronounced the dissolution of the council of Basel, and summoned the fathers to Ferrara, where on Jan. 8, 1438, he opened a new synod which he later transferred to Florence. In this latter town took place the momentary union, which was more apparent than real, between the Latin and the Greek Church (July 6, 1439). During this time the council of Basel, though abandoned by Cesarini and most of its members, persisted none the less, under the presidency of Cardinal Aleman, in affirming its oecumenical character. On Jan. 24, 1438, it suspended Eugenius IV., and went on in spite of the intervention of most of the powers to pronounce his deposition (June 25, 1439), finally giving rise to a new schism by electing on Nov. 4 Amadeus VIII., duke of Savoy, as pope, who took the name of Felix V.

This schism lasted fully ten years, although the antipope found hardly any adherents outside of his own hereditary states, those of Alphonso of Aragon, of the Swiss confederation and certain universities. Germany remained neutral; Charles VII. of France confined himself to securing to his kingdom the benefit of a great number of the reforms decreed at Basel; by the "Pragmatic Sanction" of Bourges, which became law on July 13, 1438, England and Italy remained faithful to Eugenius. The prestige of the council grew rapidly weaker. In June 1448 it migrated to Lausanne, and the antipope, at the instance of France, ended by abdicating (April 1449). Eugenius IV. died in Feb. 1447, and the fathers of Lau-

sanne, to save appearances, gave their support to his successor, Nicholas V., who had already been governing the Church for two years. Trustworthy evidence, they said, proved to them that this pontiff accepted the dogma of the superiority of the council as it had been defined at Constance and at Basel. In reality, the struggle which they had carried on in defence of this principle for 17 years, with a good faith which it is impossible to ignore, ended in a defeat. The papacy, which had been so fundamentally shaken by the great schism of the west, came through this trial victorious. The era of the great councils of the 15th century was closed; the constitution of the Church remained monarchical.

See Gieseler, *Ecclesiastical History* (Eng. trans. Edinburgh, 1853), vol. iv.; and the standard authorities, Mansi, *Concilia*, vol. xxix.; and Hefele, *Conciliengeschichte*, vol. v. (written in view of the promulgation of the dogma of papal infallibility by the Vatican Council of 1870).

BASEL: see BASLE.

BASEMENT, in a building, a storey partly below the surrounding ground level; more loosely the ground storey of a building when that storey is of subsidiary importance. The term is applied specifically when the exterior treatment of this storey is simpler or more rugged than that of the superstructure. The basement then serves the function of a pedestal.

BASE METABOLISM: see DIET AND DIETETICS.

BASHAHR, a Rajput hill state, within the Punjab, amid the Himalaya mountains, with an area of 3,881 sq.m. and a population in 1921 of 90,366. The revenue is obtained chiefly from land and forests. The latter are very valuable.

BASHAN, a district east of the Jordan whose bounds cannot be determined with accuracy. On the east it would seem to have been bounded by Jebel Hauran and Salkhad (Salcah) (Deut. iii. 10, Josh. xii. 4, xiii. 11), on the south by the river Yarmūk (Hieromax) and a line drawn through Dera'a (Edrei) and Salkhad, on the west by the districts Geshur and Maacah (Josh. xii. 5) which may possibly have been strips of territory separating it from the Jordan valley, whilst on the north it stretched out towards the Hermon range (Deut. xxxiii. 22). The extent of the region to which the name Bashan could be applied appears to have fluctuated. In a wide sense it was applied to the northernmost of the three great divisions into which Eastern Palestine fell (Moab, Gilead, Bashan: Deut. iv. 43, II. Ki. x. 33). In the time of Og, Bashan included Edrei and Salcah (Deut. iii. 10, etc.). The graecized name Batanaea was later applied to the southern portion only of the region indicated, other portions being particularized as Auranitis, Golanitis, Trachonitis (Josephus, *Antiq.* iv. v. 3). Golan was a "city of refuge" in Bashan (Deut. iv. 43), and is perhaps one of the sites in the modern Jaulān. The Argob (I. Ki. iv. 13) in Bashan was probably a district whose western boundary was the Wady-er-Rukkād with southern extension to include northern Gilead. Whatever the variations of Bashan's area may have been, there seems no doubt that its core was the fertile plain now known as En-Nukra ("hearth-hole") stretching westward from the Jebel Hauran.

The chief towns of Bashan to which reference is made in the Old Testament are Ashtaroth-Karnaim (Carneas,—now perhaps Tell-'Ashtara or Tell-Ash'ari, both south-west of Sheikh Sa'ad), Edrei (Dera'a, identified probably mistakenly with Aduri of the Amarna letters), Golan (somewhere in Jaulān), Salcah (Salkhad) and Bosra (Bostra, mod. Busrā). As the ruins on these sites date from the first century A.D., excavation alone can establish whether they were occupied prior to that time. In this neighbourhood and more especially in the Lejā and Jebel Hauran are found the remains of many deserted towns of a former day. According to Wetzstein the Jebel Hauran has 300 such on its east and south slopes. An edict of A.D. 40 (Herod Agrippa) reveals how the population lived in caverns and subterranean cities as a protection against Arab nomads, and enjoins them to abandon this "bestial mode of life" (*θηριώδης κατάστας*). The abodes of the people, as the sites testify, were either caverns hollowed out of the mountain (as on the east of Jebel Hauran), or underground homes entered by concealed shafts (as west of Jebel ez-Zumla). At Edrei there is an entire city underground, now partially destroyed. Their buildings above ground have been built of huge blocks of

black basalt, the almost entire absence of wood being a curious feature, doors, staircases, galleries, roofs, etc., being of basalt. "An awful silence fills the sable ruins, there is never a face nor a flower, nor the flutter of a robe in all the bare black streets" (G. A. Smith).

Bashan was famous of old for its oaks (Is. ii. 13, Zech. xi. 2, Ezek. xxvii. 6). The Nukra is a treeless plain but on the ridges of Gilead to the south and on the western slopes of Jebel Hauran trees flourish, amongst them oaks. Bashan was famous too, for its cattle (Deut. xxxii. 14, Ps. xxii. 12). The haughty women of Samaria are likened by Amos to kine of Bashan (iv. 1).

History.—In Numbers xxi. 33 *seq.* we are told how the Israelites defeated Og at his frontier city Edrei and took his land. The territory of Bashan was assigned to the half-tribe Manasseh (Deut. iii. 13, iv. 43; Josh. xiii. 29). It was one of Solomon's commissariat districts (I. Ki. iv. 13), and was smitten by Hazael (II. Ki. x. 33). Judas Maccabaeus, in a victorious campaign against the Greeks and their native allies, penetrated to Bosra. From 84–81 B.C. Bashan was under the rule of Alexander Jannaeus, but the rest of the land to the east belonged to the Nabataeans. Pompey and his legions drove the latter southward (64 B.C.) and Bosra and Salcah became their northernmost towns. Herod who had conducted war in this region (32 B.C.) was made its ruler by Augustus. By means of fortresses and a garrison of 3,000 legionaries he maintained a precarious peace and by proclaiming freedom from taxation attracted an ample population. Herod's son succeeded to a tetrarchy comprising Gaulanitis, Batanaea, Trachonitis, Auranitis (4 B.C.) which later passed to Herod Agrippa (A.D. 37–44). In A.D. 106 Trajan brought the whole Nabataean kingdom under the empire in creating the province of Arabia with Bosra as capital, thus ensuring within the frontier, extended far eastwards, security for the fertile plains of Bashan. Cities rapidly grew out of villages, boasting that which was Rome in colonnaded streets, basilicas, theatres, aqueducts, only to sink back into oblivion when the frontier had been broken, the Roman power had passed away, and the desert had resumed its invasion of the town. When southern Arabian Christian stems founded the Ghassanid kingdom (A.D. 200) Bashan bloomed again. Bosra eventually became the ecclesiastical capital of the Hauran (cathedral built in 512) and as a trading centre was second only to Damascus. Thither came Mohammed from Mecca with his camel-train to learn in the intervals of trade all he knew of Christianity. By 635 Damascus had fallen to the Arabs and a blight had settled permanently on the broad acres of Bashan and on ruined cities in whose deserted streets bewildered nomads still wander. The crusaders made two expeditions to Bosra (1113 and 1119). Bashan they called the territory of Suhete or Sute (Suweida?) but they made no settlement there. To-day the Hauran is one of the strongholds of the Druses (*q.v.*) of whom it shelters some 50,000. The independence of the territory of Jebel ed-Druz (Jebel Hauran) was recognized by the Mandatory power (France) in an agreement with Druse chiefs (1921). Its independence was officially proclaimed on April 5, 1922.

Archaeology.—French control of the Hauran district has given a stimulus to archaeological investigation. A fine basalt lion of Syro-Hittite style, discovered long ago at Sheikh Sa'ad (north of Dera'a), has been removed to the museum at Damascus. At Kanawat, a church in the middle of a temple of the Roman epoch, at Shuhba (Philippopolis) a great temple, theatre and a Roman villa with mosaics claimed to be the finest yet found in Syria, have been laid bare. At Suweida, the capital, where is now a lapidary museum, a small church and a Roman villa have been excavated. An archaeological survey of the region has been carried out by the French and a large number of new inscriptions (400 Greek texts and 300 Safaitic as well as some Nabataean) along with monuments have been brought to Suweida (1925).

BASHI-BAZOUK, the name given to a species of irregular mounted troops employed by the Turks, which earned notoriety during the 19th century. They were armed and maintained by the Government but did not receive pay nor wear uniform. Their uncertain discipline and temper sometimes made it necessary for the Turkish regular troops to disarm them by force, but they were often useful in the work of reconnaissance and in outpost duty. They were accused, and generally with justice, of robbery and maltreatment of the civil population, resembling in those things, as in their fighting methods and value, the Croats, Pandours and Tolpatches of 18th-century European armies. The term was also used of a mounted force, existing in peace time in various provinces of the Turkish empire, which performed the duties of gendarmerie.

BASHKALE, a chief town of a *kaimmakamlık* in the vilayet of Van in Turkey. It is a military station, situated at an elevation of 7,500ft. above sea-level in the valley of the Great Zab, and is the centre of the Hakkari Kurds. Pop. (1927), 5,164.

BASHKIR REPUBLIC, an Autonomous Socialist Soviet Republic, created May 1919. Its boundaries are, north and east, the new area of Uralsk (centre Sverdlovsk, formerly Ekaterinburg and quite distinct from the Uralsk of the Southern Ural Province); south-east and south-west, Orenburg; west, Samara and the Autonomous Tatar S.S.R. Area 157,000 sq. km. Pop., 2,691,308, urban 165,755, rural 2,525,553. The area consists mainly of the densely wooded, craggy western slopes and foothills of the Ural mountains (3,900–5,230ft.) and the plateau (*c.* 1,000ft.) extending south-west from them. The Byelaya, Ufa and Demä rivers and their tributaries have deeply entrenched the plateau, and the town of Ufa is situated in a plain where the entrenched valleys meet. A tongue of the Uralsk area extends south-westwards into the republic and includes the famous Zlatoust mining area: thus the lake and forest dotted canton of Argayash, pop. 100,581, entirely rural, is isolated from the rest of the republic. In the south-west of the main area the forest is replaced by steppe, while in the west and north-west the forest only remains in patches. From the left bank of the Byelaya, south of its junction with the Ufa, there extends westward a broad belt of thick and fertile black earth soil; eastwards into the hill zone the black earth is degraded and lichen and passes into a podzolized type in the forest zone (*see* RUSSIA: *Soils*). The climate is severe; the rivers being frozen 158 days at Ufa, average temp. Jan. 5.5°, July 68°, and the rainfall is scanty and variable in the west and south-west especially.

During the civil war following the 1917 revolution, Bashkiria suffered severely: some regions changed hands as many as 15 times and the tribesmen could not follow the course of events, since they were mainly illiterate. Following on the exhaustion of the people and the commandeering of their horses, carts, sheep, goats and food for the purposes of the conflicting armies, came the terrible famine of 1921–22. The number of horses, cattle, sheep, pigs and goats was catastrophically diminished. The following figures illustrate the extent of the agricultural disaster:—

Harvest in Poods per dessiatin

	Rye	Wheat	Spelt	Barley	Oats	Millet
1913	59	53	62	72	67	50
1921	16	2.4		10	1.7	5.6
	Buck-wheat	Plas	Potatoes	Flax	Hemp	
1913	45	5	450	44	46	
1921	7.7					

The reorganization of agriculture is hampered by the lack of cattle and farm implements and also by the difficulty which the tribesmen find in adapting themselves to the Communist system of land tenure, which is radically different from their own. Many Bashkirs are still nomadic herders of cattle, sheep and horses. Dairying and beekeeping are extensively carried on and honey, wax, butter and eggs are produced. Kumiss (fermented mare's milk) sanatoria are established on the west bank of the Derna. The area of settled agriculture is slowly extending from the west. Bashkiria has much mineral wealth, including gold, copper and coal; iron and copper are smelted at Ufa, and copper in the south, especially at Zilair (formerly Preobrazhensk). There are several timber mills and glass and crockery factories. Other industries are flour-milling, brandy distilling, the making of cloth, leather tanning, paper-making, brick-making, etc. Ufa (*q.v.*), the administrative centre, has extensive printing works.

The Bashkirs formerly inhabited the Russian governments of Ufa, Orenburg, Perm and Samara and parts of Vyatka, especially on the slopes and confines of the Ural, and in the neighbouring plains. They speak a Tatar language. The name Bashkir or Bash-kürt (a mere nickname) appears for the first time in the beginning of the 10th century in the writings of Ibn-Foslan, who, describing his travels among the Volga-Bulgarians, mentions the Bashkirs as a warlike and idolatrous race. Joannes de Plano Carpini (*c.* 1200–60) and William of Rubruquis (1220–93) are the first European writers to mention them. Hamy considered them to be intermediate between the Turki and the Mongol type.

They were independent and troublesome to their neighbours, the Bulgarians and Pechenegs, until the Mongolian invasion of the mid-13th century. In 1556 they submitted to Russia and paid a fur tax, and Ufa was built to protect them against the Kirghiz. They rebelled in 1676 (under Seit), in 1707 (under Aldar) and again from 1735–41. In 1786 they were freed from taxes, and in 1798 an irregular army was formed among them. The problem of the Bashkir republic is complicated by the racial diversity of the population, which includes about 51% of Bashkirs and Tatars, 34% of Great Russians and small numbers of Little Russians, Marii, Chuvash, Mordva, White Russians, Votyaks, Latvians, Germans, Jews, Poles and Estonians. A further difficulty is that the town population is mainly Russian (77.7%). The general cultural level is low; apart from the Russian element, the percentage of illiteracy is possibly in places as high as 90%. The disorganization wrought by civil war and famine is such that it is difficult to provide education. There is a lack of teachers, of school premises and of equipment, and only about 25% of non-Russian children of school age are receiving education. This illiteracy and the diversity of the spoken languages reacts unfavourably on the economic and social life of the republic.

The Bashkirs are divided into settled and nomadic. The former are engaged in agriculture, cattle-rearing and bee-keeping, and live without want. The nomadic portion is subdivided, according to the districts in which they wander, into those of the mountains and those of the steppes. Almost their sole occupation is the rearing of cattle; and they attend to that in a very negligent manner, not collecting a sufficient store of winter fodder for all their herds, but allowing part of them to perish. The Bashkirs are usually very poor, and in winter live partly on a kind of gruel called *yäryu*, and badly prepared cheese named *shürt*. They are hospitable but suspicious, apt to plunder and to the last degree lazy. They have large heads, black hair, eyes narrow and flat, small foreheads, ears always sticking out and a swarthy skin. In general, they are strong and muscular, and able to endure all kinds of labour and privation. They profess Mohammedanism, but know little of its doctrines and know practically nothing of its scriptures.

See J. P. Carpini, *Liber Tartarorum*, edited under the title *Relations des Mongols ou Tartares*, by d'Avezac (Paris, 1838); Gulielmus de Rubruquis, *The Journey of William of Rubruck to the Eastern Parts of the World*, translated by W. W. Rockhill (London, 1900); Semenoff, *Slovar Ross. Imp.*, s.v.; Frähn, "De Baskiris," in *Mém. de l'Acad. de St-Petersbourg* (1822); Florinsky, in *Westnik Evrope* (1874); and Katarinskij, *Dictionnaire Bashkir-Russe* (1900). BASHKIRTSEFF, MARIA CONSTANTINOVA [MARIE] (1860–1884), Russian artist and writer, was born at Gavrontsi, in the government of Pultowa, in Russia, on Nov. 23, 1860. Her parents lived apart, and the child spent her early life with her mother in various health resorts in Germany and the Riviera. She received a good education in ancient and modern languages, and began to study singing. But her voice failed her, and she began the serious study of painting in Tony Robert-Fleury's studio in Paris in 1877. In 1880 she exhibited in the salon a portrait of a woman; in 1881 she exhibited the "Atelier Julian"; in 1882 "Jean et Jacques"; in 1884 the "Meeting," and a portrait in pastel of a lady—her cousin—now in the Luxembourg gallery, for which she was awarded a *mention honorable*. Her health, always delicate, could not endure the double strain of artistic work and social life, and she died of tuberculosis on Oct. 31, 1884. But it is not as an artist that Marie is remembered, though she had marked talent.

From her childhood Marie Bashkirtseff kept an autobiographical journal, part of which was published after her death. These brilliant confessions (*Journal de Marie Bashkirtseff*, 1890) bear the stamp of truth, and constitute a record of extraordinary interest, though the editing aroused some protest.

A further instalment of Marie Bashkirtseff literature was published in the shape of letters between her and Guy de Maupassant, with whom she started a correspondence under a feigned name and without revealing her identity.

See Mathilde Blind, *A Study of Marie Bashkirtseff* (1892); *The Journal of Marie Bashkirtseff*, trans. with an intro., by Mathilde Blind (1890); *Black and White* (Feb. 6 and April 11, 1891), pp. 17, 304; *The Letters of Marie Bashkirtseff* (1891).

BASIC SLAG, a by-product of steel manufacture, is formed when phosphatic ores are used in converters lined with lime or magnesia, as in the Thomas-Gilchrist or "basic" process. The phosphorus containing material of the ore combines with the lining material of the converter to form basic phosphates. This material, if finely ground, serves as a valuable fertilizer. Its value is due in large part to its phosphatic content, although the lime content also is valuable. (See STEEL MANUFACTURE; FERTILIZERS.)

BASIL THE GREAT (*c.* 330–379), bishop of Caesarea (and founder of monastic institutions) came of a famous family, which gave a number of distinguished supporters to the Church. His eldest sister, Macrina, was celebrated for her saintly life; his second brother was the famous Gregory of Nyssa; his youngest was Peter, bishop of Sebaste; and his eldest brother was the famous Christian jurist Naucratius. Basil was born at Caesarea in Cappadocia. While he was still a child, the family removed to Pontus, but he soon returned to Cappadocia to live with his mother's relations. Eager to learn, he went to Constantinople (*c.* 346) and after four or five years there, to Athens, where he had Gregory (*q.v.*) of Nazianzus for a fellow-student. Both men were deeply influenced by Origen, and compiled the famous anthology of his writings, known as *Philocalia* (edited by J. A. Robinson, Cambridge, 1893). It was at Athens that he seriously began to think of religion, and resolved to seek out the most famous hermit saints in Syria and Egypt in order to learn from them how to attain to sincere piety, and how to practise asceticism. About 360, we find him leading the monastic life at Annesi in Pontus, near the convent in which his mother, Emilia now a widow and his sister Macrina were living. He was not ordained priest until (*c.*) 365, and his ordination was probably the result of the entreaties of his ecclesiastical superiors, who wished to use his talents against the Arians, so numerous in that part of the country and favoured by the Arian emperor, Valens, then reigning in Constantinople. In 370 Eusebius, bishop of Caesarea, died, and Basil was chosen to succeed him. It was then that his great powers were called into action to stamp out Arianism and to unite the scattered orthodox elements in the East. Caesarea was an important diocese, and its bishop was *ex officio*, exarch of the great diocese of Pontus. Hot-blooded and somewhat imperious, Basil was also generous and sympathetic as may be seen from his letters. "His zeal for orthodoxy did not blind him to what was good in an opponent; and for the sake of peace and charity he was content to waive the use of orthodox terminology

when it could be surrendered without a sacrifice of truth." Basil is also important for his improvement of the liturgy (the liturgy of St. Basil still being used in the Eastern Church) and for his propagation of a monastic life that substituted hard labour, works of charity and the common life, for the existing hermitical asceticism (see BASILIAN MONKS). He died in 379.

The principal theological writings of Basil are his *De Spiritu Sancto*, a lucid and edifying appeal to Scripture and early Christian tradition, and his three books against Eunomius, the chief exponent of Anomoian Arianism. He was a famous preacher, and many of his homilies, including the *Hexaëmeron*, a series of sermons on the opening verses of Genesis and an exposition of the psalter, have been preserved. His ascetic writings include the *Moralia* and *Regulae*, ethical manuals for use in the world and the cloister respectively. His numerous letters reveal a rich and observant nature, which, despite the troubles of ill-health and ecclesiastical unrest, remained optimistic, tender and even playful.

The name Basil also belongs to several other distinguished churchmen. (i.) Basil, bishop of Ancyra from 336 to 360, a semi-Arian, highly favoured by the emperor Constantine, and a great polemical writer; none of his works are extant. (ii.) Basil of Seleucia (fl. 448-458), a bishop who shifted sides continually in the Eutychian controversy, and who wrote extensively; his works were published in Paris in 1622. (iii.) Basil of Ancyra (fl. 787); he opposed image-worship at the second council of Nicaea, but afterwards retracted. (iv.) Basil of Achrida, archbishop of Thessalonica about 1155; he was a staunch upholder of the claims of the Eastern Church against the widening supremacy of the papacy.

BIBLIOGRAPHY.—A good text of the works of St. Basil appears in Migne's *Patrol. ser. graec.* 29-32; *De Spiritu Sancto*, ed. C. F. H. Johnston (Oxford, 1892); *Liturgia*, ed. A. Robertson (1894). Besides other trans., the *De Spiritu Sancto*, the *Hexaëmeron*, and the *Letters* are rendered into English in the *Nicene and Post Nicene Series* Vol. viii. 1895. The ascetic works were trans. by W. K. L. Clarke (1925). See also O. Bardenhewer, *Patrol.* 3 A. (1910), 241-249. W. K. L. Clarke: *St. Basil the Great* (Cambridge, 1913); P. Allard: *Saint Basile* (5th ed. 1903); L. Thorndike: *Hist. of Magic and Experimental Science* (1923), vol. i. p. 481 seq.

BASIL I. (d. 886), known as the "MACEDONIAN," Roman emperor in the East, was born of a family of Armenian (not Slavonic) descent, settled in Macedonia. He spent a part of his boyhood in captivity in Bulgaria, whither his family was carried by the Bulgarian prince Krum in 813, but returned to Constantinople, where he ultimately became the favourite of Michael III., and was appointed chamberlain (*parakoemōmenos*). To please his master he divorced his wife and married a mistress of Michael, Eudocia Ingerina. In April 866, with Michael's consent, he murdered the powerful Caesar Bardas, and a few weeks later was made emperor. In Sept. 867 he caused Michael to be assassinated, and reigned alone. On the throne this unprincipled adventurer showed his exceptional capacities for administration. He inaugurated a new age in the history of the empire, associated with the dynasty which he founded—"the Macedonian dynasty" it is usually called; it would be more instructive to call it "Armenian." It was a period of territorial expansion, during which the empire was the strongest power in Europe. The great legislative work which Basil undertook and his successor completed, and which may be described as a revival of Justinian law, entitles him to the designation of a second Justinian (the *Basilica*, a collection of laws in 60 books; and the manuals known as the *Prochiron* and *Epanagōgē*. For this legislation see BASILICA and ROMAN EMPIRE, LATER). His financial administration was prudent. His ecclesiastical policy was marked by a wish to keep on good terms with Rome. One of his first acts was to exile the patriarch Photius and restore his rival Ignatius, whose claims were supported by the pope. Yet he had no intention of yielding to Rome's pretensions beyond a certain point. The decision of the Bulgarian tsar Michael to submit the new Bulgarian Church to the jurisdiction of Constantinople was a blow to Rome. In 877 Photius became patriarch again, and there was a virtual breach with Rome. Thus the independence of the Greek Church may be said to date from the time of Basil. His reign was marked by a troublesome war with the Paulician heretics, an inheritance from

his predecessor; the death of their able chief Chrysoschir led to the definite subjection of this little state, of which the chief stronghold was Tephrike on the upper Euphrates, and which the Saracens had helped to bid a long defiance to the government of Constantinople. There was the usual frontier warfare with the Saracens in Asia Minor. Cyprus was recovered but only retained for seven years. Syracuse was lost but Bari was won back and those parts of Calabria which had been occupied by the Saracens. The last successes opened a new period of Byzantine domination in southern Italy. Above all, New Rome was again mistress of the sea, and especially of the gates of the Adriatic. Basil died on Aug. 29, 886. He is one of the most remarkable examples of a man, without education and exposed to the most demoralizing influences, manifesting extraordinary talents in the government of a great state, when he had climbed to the throne by acts of unscrupulous bloodshed.

BASIL II. (c. 958-1025), known as BULGAROKTONOS (slayer of Bulgarians), Roman emperor in the East, son of Romanus II. and Theophano, and great-great-grandson of Basil I., born about 958 and crowned on April 22, 960. After their father's death (963) he and his younger brother Constantine were nominal emperors during the actual reigns of Nicephorus Phocas, their stepfather, and John Tzimiskes. On the death of the latter (Jan. 10, 976) they assumed the sovereignty without a colleague, but throughout their joint reign Constantine exercised no power. Basil did not at first display the full extent of his energy. The administration remained in the hands of the eunuch Basileios. Basil waited and watched without interfering, and devoted himself to learning the details of administrative business and instructing himself in military science. During this time the throne was endangered by the rebellion of an ambitious general, Bardas Sclerus, on the eastern frontier. To oppose him, Bardas Phocas, another general who had revolted in the previous reign, was recalled and suppressed the revolt (979). Phocas remained general in the East till 987, when he was proclaimed emperor by his troops, apparently with the connivance of Basileios. Basil advanced to Abydos, which Phocas was besieging, but before a battle could be fought, the rebel died suddenly, and the rising collapsed. Basileios was exiled and his property confiscated.

Basil made ruthless war upon the system of immense estates which had grown up in Asia Minor and which his predecessor, Romanus I., had endeavoured to check. (For this evil and the legislation which was aimed at it see ROMAN EMPIRE, LATER.) He sought to protect the lower and middle classes.

Basil gained some successes against the Saracens (995); but his most important work in the East was the annexation of Armenia. He created in those highlands a strongly fortified frontier, which, if his successors had been capable, should have proved an effective barrier against the invasions of the Seljuk Turks. The greatest achievement of the reign was the subjugation of Bulgaria. After the death of Tzimiskes (who had reduced only the eastern part of the Bulgarian kingdom), the power of Bulgaria was restored by the tsar Samuel who extended his rule along the Adriatic coast and imposed his lordship on Serbia. War was renewed in 996, and Eastern Bulgaria was recovered in 1000; but the war continued till 1014, when the Bulgarian army suffered an overwhelming defeat. Basil blinded 15,000 prisoners, leaving a one-eyed man to every hundred to lead them to their tsar, who fainted at the sight and died two days later. The last sparks of resistance were extinguished in 1018, and the great Slavonic realm lay in the dust. The power of Byzantium controlled once more the Illyrian peninsula. Basil died in Dec. 1025 in the midst of preparations to send a naval expedition to recover Sicily from the Saracens.

Basil's reign marks the highest point of the power of the Eastern empire since Justinian I. Part of the credit is due to Nicephorus and Tzimiskes, but the greater part belongs to him. He dedicated himself unsparingly to the laborious duties of ruling, and he had to reckon throughout with the ill-will of a rich and powerful section of his subjects. He was hard and cruel, without any refinement or interest in culture. In a contemporary psalter (preserved in the library of St. Mark at Venice) there is a portrait of him, with a grey beard, crowned and robed in imperial costume.

BASIL (Russ. VASILY), the name of four grand-dukes of Moscow and tsars of Muscovy.

BASIL I., DMITREVICH (1371–1425), son of Dmitri (Demetrius) Donskoi, whom he succeeded in 1389, married Sophia, the daughter of Vitovt, grand-duke of Lithuania. Basil annexed the principality of Suzdal, with the city of Nijni Novgorod, to Muscovy, together with Murom, Kozelsk, Przemysl, and other places; reduced the grand-duchy of Rostov to a state of vassalage; and acquired territory from the republic of Great Novgorod by treaty. In his reign occurred the invasion of Timur (1395), who ruined the Volgan regions, but did not penetrate so far as Moscow. Indeed Timur's raid was of service to the Russian prince as it all but wiped out the Golden Horde (q.v.); which for the next 12 years was in a state of anarchy. During the whole of this time no tribute was paid to the khan, though vast sums of money were collected in the Moscow treasury for military purposes. In 1408 the Mirza Edigei ravaged Muscovite territory, but retired on receiving a sum of money. In 1412, however, Basil found it necessary to pay the long-deferred visit of submission to the Horde. During this reign the Bulgarian, Gregory Tsamblak was appointed to the metropolitan see of Kiev (1425), by the grand duke of Lithuania; an event blamed by some for the weakening of Muscovy's hold on the south-western Russian states. During Basil's reign a terrible visitation of the "Black Death" decimated the population.

See T. Schiemann *Russland bis ins 17. Jahrhundert* (Gotha, 1885–87).

BASIL II., called TEMNY ("the BLIND") (1415–62), son of the preceding, succeeded his father as grand-duke of Moscow in 1425. In 1430 Basil was seized by his uncle, Yury of Halicz, and sent a prisoner to Kostroma, but Basil was reinstated with the concurrence of the khan. On the death of Yury, Basil was at constant variance with Yury's children, one of whom (Basil) he had blinded; but in 1445 the grand-duke fell into the hands of blind Basil's brother, Shemyak, and was himself deprived of his sight and banished (1445). The clergy and people, however, reinstated him, put Shemyak to flight, and seized Halicz, his patrimony. During the remainder of Basil II's reign he slowly and unobtrusively added district after district to the grand-duchy of Muscovy, so that in time, only the republics of Novgorod and Pskov and the principalities of Tver and Vereya remained independent of Moscow. All this time the realm was overrun continually by the Tatars and Lithuanians, and suffered severely from their depredations. Basil was for a short time a prisoner of the Tatar ruler of Kazan in 1443, and in 1451 the Tatars appeared before Moscow, only to be repulsed. His reign saw the foundation of the Solovetsk monastery and the rise of the khanate of the Crimea. In 1448 the north Russian Church became virtually independent of the patriarchal see of Constantinople by adopting the practice of selecting its metropolitan from among native priests and prelates exclusively.

BASIL III., IVANOVICH (1479–1533), tsar of Muscovy, son of Ivan III. and Sophia Palaeologa, succeeded his father in 1505. A crafty prince, with all the tenacity of his race, Basil succeeded

in incorporating with Muscovy the last remnants of the ancient independent principalities, by accusing the princes of Ryazan and Syeversk of conspiracy against him, seizing their persons, and annexing their domains (1517–23). Seven years earlier (Jan. 24 1510) the last free republic of old Russia, Pskov, was deprived of its charter and assembly bell, which were sent to Moscow. Basil also captured Smolensk, the great eastern fortress of Poland (1512), chiefly through the aid of the rebel Lithuanian, Prince Michael Glinsky, who provided him with artillery and engineers from western Europe. Although in 1519 he was obliged to buy off the khan of the Crimea, Mohammed Girai, under the very walls of Moscow, towards the end of his reign he established the Russian influence on the Volga, and in 1530 placed the pretender Elanyei on the throne of Kazan. Basil was the first grand-duke of Moscow who adopted the title of tsar and the double-headed eagle of the East Roman empire. By his second wife, Helena Glinska, whom he married in 1526, Basil had a son Ivan, who succeeded him as Ivan IV.

See Sigismund Herberstein *Rerum Moscoviticarum Commentarii* (1549).

BASIL IV., SHUISKY (d. 1612), tsar of Muscovy, was during the reigns of Theodore I. and Boris Godunov, one of the leading *boyars* of Muscovy. It was he who, in obedience to the secret orders of Tsar Boris, went to Uglich to enquire into the cause of the death of Demetrius, the infant son of Ivan the Terrible, who had been murdered there. Shuisky reported that he had died in a fit of apoplexy, by falling on a knife. Nevertheless, after the death of Boris and the murder of his young son and successor, Theodore, Shuisky first acknowledged the pretender, the "false Demetrius" and then secretly denounced him. This came to Demetrius' ears who pardoned Shuisky in the hope of winning him over. But in May 1606 Shuisky procured Demetrius' death, and had himself proclaimed tsar. His authority was never generally acknowledged, and even in Moscow his authority was small. He was deposed on July 19 1610. Only the popularity of his heroic cousin, Prince Michael Skopin-Shuisky, who led his armies and fought his battles for him, and soldiers from Sweden, whose assistance he purchased by a disgraceful cession of Russian territory, kept him for a time on his unstable throne. In 1610 he was deposed, made a monk, and finally carried off as a trophy by the Polish grand hetman, Stanislaus Zolkievski. He died at Warsaw in 1612.

See R. Nisbet Bain, *Slavonic Europe*, ch. viii. (Cambridge, 1907).

BASILAR MEMBRANE, a tissue lying under the organ of Corti in the cochlea of the internal ear of the higher vertebrates. It consists of transverse fibres which are not free but are packed together tightly side by side and embedded in a cementing substance and covered on both upper and lower surfaces by a layer of cells. As it approaches the apex of the spiral of the cochlea, it becomes gradually wider; Keith's measurements of the membrane in man gave a width of 0.17mm. at the base and 0.40mm. at the apex of the cochlea. The average length of the membrane is 35 millimetres. Its function in hearing has been the subject of much controversy and no satisfactory theory has as yet been developed. According to the "resonance" theory of hearing, commonly associated with the name of Helmholtz, the transverse fibres are a graduated set of resonators, each of which, by reason of its mass and length, the tension exerted on it by the spiral ligament and the loading produced by the columns of lymph lying between it and the two windows of the cochlea, is attuned to a tone of definite pitch and is thrown into sympathetic vibration which excites the hair-cells connected with the auditory nerve when the appropriate tone is transmitted to the cochlea. The partial vibrations of which a complex vibration is composed excite different fibres, and the ability of the ear to analyze complex tones is thus explained. Max Meyer's theory is that the membrane responds by forced, not by sympathetic vibration, that the frequency rather than the place of excitation of the hair-cells determines the pitch heard, and that the longitudinal extent of the membrane involved in the vibration, and thus the number of cells stimulated, is the correlate of loudness. Other theories assume that the membrane vibrates as a whole. Ewald held that it vibrates as a whole with nodes or lines of rest in different places according to the pitch of the tone. Still

another theory attributes no particular function to this membrane but claims that the essential tissue concerned in the excitation of the hair-cells is the tectorial membrane. (See HEARING.)

BASILIAN MONKS, those who follow the rule of Basil the Great. The chief importance of the monastic rule and institute of St. Basil lies in the fact that to this day his reconstruction of the monastic life is the basis of the monasticism of the Greek and Slavonic Churches, though the monks do not call themselves Basilians. St. Basil's claim to the authorship of the Rules and other ascetical writings that go under his name, has been questioned; but the tendency now is to recognize as his, at any rate, the two sets of Rules. Probably the truest idea of his monastic system may be derived from a correspondence between him and St. Gregory Nazianzen at the beginning of his monastic life, the chief portions whereof are translated by Newman in the *Church of the Fathers*, "Basil and Gregory," secs. 4, 5. On leaving Athens Basil visited the monasteries of Egypt and Palestine; in the latter country and in Syria the monastic life tended to become more and more eremitical and to run to great extravagances in the matter of bodily austerities. (See MONASTICISM.) When (about 360) Basil formed his monastery in the neighbourhood of Neocaesarea in Pontus, he deliberately set himself against these tendencies. He declared that the "cenobitic" or community life is superior to the "eremitic" of the isolated hermit; that fasting and austerities should not interfere with prayer or work; that work should form an integral part of the monastic life, not merely as an occupation, but for its own sake and in order to do good to others; and therefore that monasteries should be near towns. All this was a new departure in monachism. The life St. Basil established was strictly cenobitical, with common prayer seven times a day, common work, common meals. It was, in spite of the new ideas, an austere life, of the kind called contemplative, given up to prayer, the reading of the Scriptures and heavy field-work.

St. Basil's influence, and the greater suitability of his institute to European ideas, ensured the propagation of Basilian monachism; and Sozomen says that in Cappadocia and the neighbouring provinces there were no hermits but only cenobites. However, the eastern hankering after the eremitical life long survived, and it was only by dint of legislation, both ecclesiastical (Council of Chalcedon) and civil (Justinian Code), that the Basilian cenobitic form of monasticism came to prevail throughout the Greek-speaking lands, though the eremitical forms have always maintained themselves.

The other creative name in the history of Greek monachism is that of Theodore, who became abbot of the monastery of the Studium in Constantinople. He set himself to reform his monastery and restore St. Basil's spirit in its primitive vigour. But to effect this, and to give permanence to the reformation, he saw that there was need of a more practical code of laws to regulate the details of the daily life, as a supplement to St. Basil's Rules. He therefore drew up constitutions, afterwards codified (see Migne, *Patrol. Graec.* xcix., 1704-57), which became the norm of the life at the Studium monastery, and gradually spread thence to the monasteries of the rest of the Greek empire. Thus to this day the Rules of Basil and the Constitutions of Theodore the Studite, along with the canons of the Councils, constitute the chief part of Greek and Russian monastic law.

The spirit of Greek monachism, as regenerated by Theodore, may best be gathered from his *Letters, Discourses and Testament*. Under the abbot were several officials to superintend the various departments; the liturgical services in the church took up a considerable portion of the day, but Theodore seems to have made no attempt to revive the early practice of the Studium in this matter (see ACOEMETI); the rest of the time was divided between reading and work; the latter included the chief handicrafts, for the monks, only ten in number, when Theodore became abbot, increased under his rule to over a thousand. One kind of work practised with great zeal and success by the Studite monks, was

the copying of manuscripts, so that to them and to the schools that went forth from them we owe a great number of existing Greek mss. and the preservation of many works of classical and ecclesiastical antiquity. In addition to this, literary and theological studies were pursued; and the life, though simple and self-denying and hard, was not of extreme austerity.

Basilian monachism spread from Greece to Italy and Russia. Rufinus had translated St. Basil's Rules into Latin (c. 400) and they became the rule of life in certain Italian monasteries. They were known to St. Benedict, who refers his monks to "the Rule of our holy Father Basil," indeed, St. Benedict owed more of the ground-ideas of his Rule to St. Basil than to any other monastic legislator. Prof. Kirsopp Lake has (1903) written four valuable articles (*Journal of Theological Studies*, iv., v.) on "The Greek monasteries of South Italy"; he deals in detail with their scriptoria and the dispersal of their libraries, a matter of much interest, in that some of the chief collections of Greek mss. in western Europe—as the Bessarion at Venice and a great number at the Vatican—come from the spoils of these Italian Basilian houses.

Of greater importance was the importation of Basilian monachism into Russia, for it thereby became the norm of monachism for all the Slavonic lands. The monasteries are of three kinds: *cenobia* proper, wherein full monastic common life, with personal poverty, is observed; others wherein the monks are allowed the use of their private means and lead a generally mitigated and free kind of monastic life; and the *lauras*, wherein the life is semi-eremitic.

The visits of Western scholars in modern times to Greek monasteries in search of mss.—notably to St. Catherine's on Mt. Sinai, and to Mt. Athos—has directed much attention to contemporary Greek monachism, and the accounts of these expeditions commonly contain descriptions, more or less sympathetic and intelligent, of the present-day life of Greek monks. The first such account was Robert Curzon's in parts iii (1834) and iv. (1837) of the *Monasteries of the Levant*; the most recent in English is Athelstan Riley's *Athos* (1887). The life is mainly given up to devotional contemplative exercises; the church services are of extreme length; intellectual study is little cultivated; and manual labour has almost disappeared.

The ecclesiastical importance of the monks in the various branches of the Eastern Orthodox Church lies in this, that as bishops must be celibate, whereas the parochial clergy must be married, the bishops are all recruited from the monks. But besides this they have been a strong spiritual and religious influence, as is recognized even by those who have scant sympathy with monastic ideals (see Harnack, *What is Christianity?* Lect. xiii, end).

A number of Basilian monasteries have always been in communion with the Roman Catholic Church: among these are the surviving houses founded in Italy and Sicily, especially the once famous monastery of Grotta Ferrata near Rome.

BASILICA, a word frequently used in Latin literature to designate a large, roofed building dedicated to public use. Markets, court-houses, covered promenades and meeting halls are all occasionally so known. Little by little the word was limited to buildings of a more or less definite form, having a central area, aisles or galleries at the sides and a raised platform, sometimes apsidal. These elements, nevertheless, are not constant, the Basilica Julia in Rome having no apse, and that at Timgad no aisles. The basilica was usually in a forum (Basilica Julia, Trajan's basilica, the basilica at Pompeii). For what a Roman architect considered a normal basilica one may consult Vitruvius v. 1.4 and vi. 3.9.

The earliest basilica known is that at Pompeii, which dates,

PLANS AND TYPES OF BASILICAS. FROM THE FIRST TO THE 19TH CENTURY

The simple timber roofed type of Basilica (like that of Trajan) developed into one of the principle types of Christian Church, after the secular Basilica of Imperial Rome had departed from earlier tradition. S. Paolo, outside the walls, and S. Maria Maggiore represent this early development, and S. Agnese outside the walls shows the simple exterior. S. Apollinare in Classe is an example of Byzantine basilica, and S. Clemente shows the type which continued into the 12th century. In S. Miniato, at Florence the raised chancel represents a mediaeval Italian variation. S. Lorenzo, at Florence is an example of highly developed basilica.

probably, from the 2nd century B.C. It shows an already highly developed form in which the aisle runs entirely around the central area with the raised platform appearing as an alcove, screened by columns, at the end opposite the entrance. This seems the normal plan for the larger basilicas. The basilica of Maxentius or Constantine, begun by Maxentius and completed by his successor, Constantine, is, however, of an entirely different type. Here the attempt was made to dispense with the colonnades and to concentrate the supports into a few enormous piers, which carry the three bays of the groined vault over the central area and at the same time furnish the dividing line between the bays of the lower side aisles. It was the application to the basilica problem of the type of construction and decoration developed in the great halls of the Roman baths.

Besides these large basilicas there were many smaller examples, and in some of these, as in the basilica of the palace of Domitian on the Palatine hill, the type comprising a nave with aisles at the sides only and an apse at the end had appeared. It was this type that the early Christians adopted for their churches, possibly because similar halls, in large private houses, had been used for Christian worship prior to the Edict of Toleration. It would appear that, in the earliest examples, side aisles were frequently lacking. After the time of Constantine, however, the existence of side aisles is universal, and is perhaps due to the fact that they were included in the three enormous basilicas—those of St. Peter, St. Paul and St. John Lateran—which he built. The church of St. Maria Maggiore, dating in its present form from the early 5th century, is similar to its three predecessors. In the Constantinian basilicas another unit, the transept (*q.v.*), made its appearance, and the cross-shaped plan thus developed became the controlling plan of the larger Christian churches in the West throughout the middle ages.

In the typical early Christian basilica the nave (*q.v.*) was separated from the side aisles by borders of columns which carried either arches or an entablature. In the later basilicas these columns, having been taken from older pagan buildings, frequently had misfit capitals. Above the entablature or arches rose the blank wall behind which were the side aisle roofs; this wall continued up as a clerestory and was pierced with a row of either square or arched windows. The nave roof was of timber, sometimes with exposed beams and sometimes with a rich, panelled wooden ceiling, carved and gilded. Side aisles (*see AISLE*) were either single or double, and occasionally of two storeys, the upper serving as a gallery for women. The side aisle ceilings, with the roof immediately above, were usually as low as the columns would permit; but in old St. Peter's, Rome, the inner aisles were much higher than the outer, which were vaulted. The apse (*q.v.*) opened from the nave by a great arch known as the triumphal arch. Occasionally, when there were transepts, another triumphal arch separated the transept from the nave. A narthex (*q.v.*), or vestibule, extended the entire width of nave and aisles, frequently open at the front with a colonnade. In addition to these general elements, there was frequently a transept, usually without aisles, at the extreme end. At the entrance end, in addition to the narthex, there was often a court or atrium (*q.v.*), surrounded by either colonnades or arcades. After the 10th century a campanile (*q.v.*), round or square, of great simplicity and usually very high, was added.

Such a building was basically simple; the exterior design was crude to the point of being barn-like, although there were occasional exceptions: old St. Peter's at Rome had a façade richly covered with mosaic, and San Lorenzo Fuori, Rome, has a handsome colonnade across the front. After the fall of Rome the interiors likewise show architectural poverty, all sorts of pagan Roman fragments being put together in meaningless and incoherent jumbles. All, however, possess interior interest and an inherent beauty due largely to the richness of their furniture and ornamentation. The decorative scheme shows that the feeling for colour and texture increased as the purely architectural sense decayed, and the development of a technique of glass mosaic offered great opportunities for impressive effects. The lower portions of the walls were usually sheathed in coloured marbles which were frequently

of rich design around the apse. Above the arches or entablatures of its flanking columns the nave wall was sometimes completely covered with mosaic; where this is absent, painting of similar character doubtless existed. The church of Sta. Maria Antiqua, at the base of the Palatine hill, shows many examples of such painting.

The climax of the decorative scheme was the triumphal arch and the mosaic of the dome of the apse. There is no formula for these decorations. They vary from the Byzantine figures of Sta. Maria in Trastevere to the rich spirals of the vine of San Clemente. They are always full of complete symbolism (*see Strzygowski's The Origin of Christian Art*). The furniture consisted of a choir screen with one or two amboes (*see AMBO*), the clergy seats and the bishop's throne in the apse, and the altar, with a baldachino (*q.v.*) or canopy above it. All this furniture was as lavishly ornamented as possible. Its framework was usually of white marble, in which were inserted plaques and roundels of dark marble and bands of mosaic, gold, red and green. Frequently the floor was also rich with marble and mosaic (*q.v.*) of this type, known as *opus Alexandrinum*.

Although the basilica is primarily characteristic of Rome, there are many examples elsewhere. In addition to the one at Parenzo, the basilica of S. Apollinare Nuovo, erected by Theodoric at the beginning of the 6th century and that of S. Apollinare in Classe 50 years later, both at Ravenna, are particularly noteworthy. In the east, the great church of St. Simeon Stylites in Syria is of modified basilica type. The church of the Nativity at Bethlehem is a basilica, as is also the church of St. John Studios in Constantinople, but the finest example in the eastern empire was St. Demetrius at Thessalonica (Salonica). Owing, however, to the example set by Justinian's great church of S. Sophia at Constantinople, the basilica form gradually passed out of use in the eastern church. Few remains exist of the earliest churches built in the north and west of Europe. England shows occasional fragmentary ruins, such as the foundation of the 4th century basilica at Silchester. Romanesque rebuilding everywhere except in Italy destroyed these early churches, yet the basilica type left an ineradicable stamp on all church building that succeeded and the basilica plan, with its nave, aisles and apse, became, with the development of vaulting, and the changes necessitated by it, the typical church building of the western church.

BASILICA, a code of law, drawn up in the Greek language, with a view to putting an end to the uncertainty which prevailed throughout the East Roman empire in the 9th century as to the authorized sources of the law. This uncertainty had been brought about by the conflicting opinions of the jurists of the 6th century as to the proper interpretation to be given to the legislation of the Emperor Justinian, from which had resulted a system of teaching, which had deprived that legislation of all authority, and the imperial judges at last were at a loss to know by what rules of law they were to regulate their decisions. There has been considerable controversy as to the part which the Emperor Basil took in fram-

ing the new code. There is, however, no doubt that he abrogated in a formal manner the ancient laws, which had fallen into desuetude, and the more probable opinion would seem to be that he caused a revision to be made of the ancient laws which were to continue in force, and divided them into 40 books, and that this code of laws was subsequently enlarged and distributed into 60 books by his son Leo the Philosopher.

No perfect ms. has been preserved of the text of the Basilica, and the existence of any portion of the code seems to have been ignored by the jurists of Western Europe, until the important bearing of it upon the study of the Roman law was brought to their attention by Viglius Zuichemus, in his preface to his edition of the Greek *Paraphrase of Theophilus*, published in 1533. A century, however, elapsed before an edition of the 60 books of the Basilica, so far as the mss. then known to exist supplied materials, was published in seven volumes, by Charles Annibal Fabrot, under the patronage of Louis XIII. of France. A newly restored and far more complete text of the 60 books of the Basilica was published at Leipzig in six volumes (1833-70), edited by K. W. E. Heimbach and G. E. Heimbach. The great bulk of the code was an obstacle to the multiplication of copies of it, whilst the necessity for them was in a great degree superseded by the publication from time to time of synopses and encheiridia of its contents, composed by the most eminent jurists, of which a very full account will be found in the *Histoire du droit byzantin*, by Mortreuil, published in Paris in 1846.

BASILICATA, a territorial division of Italy, comprising the provinces of Matera and Potenza, part of the ancient Lucania (*q.v.*). It is bounded on the north by the province of Foggia, north-east by those of Bari and Lecce, east by the Gulf of Taranto (for a distance of 24 miles), south by the province of Cosenza, and west by the Mediterranean and the provinces of Salerno and Avellino. Area, 3,854sq.m. The province is mountainous, with M. Pollino (7,325ft.) on the boundary of Cosenza, while the M. Vulture, at the north-western extremity, is an extinct volcano (4,365-ft.). Five rivers, the Bradano (104 miles long), Basento, Cavone or Salandrella, Agri and Sinni run south-east or east into the Gulf of Taranto. The railway from Naples eastward to Taranto and Brindisi passes through Potenza and reaches at Metaponto the east coast line from Taranto to Reggio di Calabria. A branch line runs north from Potenza via Melfi to Rochetta S. Antonio, a junction for Foggia, Gioia del Colle and Avellino (the second of these lines runs through the province of Potenza as far as Palazzo S. Gervasio), while a branch southward from the Naples and Taranto line at Sicignano terminates at Lagonegro on the western edge of the province. The mountains are still to some extent clothed with forests; in places the soil is fertile, especially along the Gulf of Taranto. Olive-oil is the most important product. Pop. (1921) 468,557. There are no towns of any size.

BASILIDES, one of the most celebrated of the Gnostics (*see* Gnosticism), flourished probably about A.D. 125 in Alexandria. Very little is known of his life; and of his doctrine there are two fundamentally different accounts: that of Irenaeus, in his great work against heresies, and that of Hippolytus in his *Philosophoumena* (also a refutation of heresies). This work was not published until 1851, having been discovered a few years earlier. In addition to this, there are variations in points of greater or less importance in the fragments of information given by Clement of Alexandria, Origen, Eusebius and the author of *The Acts of Archelaus* (of which a complete Latin translation was discovered by Traube and published by Beeson in 1906). The conflicting statements may be partly accounted for by the failure of these writers to distinguish clearly the ideas of Basilides himself, first from those of his son Isidorus, and secondly from those of the school which he (Basilides) founded.

According to Irenaeus, the system resembled that of Valentinus (*q.v.*), and, like the Gnostic systems generally, had its root in an endeavour to explain the origin of evil. The First Principle or Supreme God, called "The Father," is incomprehensible and uncreated. From Him proceeded in succession five *emanations*: *νοῦς*, *λόγος*, *φρόνησις*, *σοφία*, *δύναμις*. Clement of Alexandria adds that from the last-named proceeded *δικαιοσύνη* and *ἐλπίς*, and these

seven with "the Father" formed the first "ogdoad" or octave of existence, creating or constituting the highest heaven. From them emanated other powers, by whom the second heaven was made, and so on in succession through 365 "heavens," each system being an inferior type or reflex of the original. The powers of the lowest heaven, of whom the chief was called the Archon (*ἄρχων*), created this world. He is the God of the Jews, a being of limited goodness, wisdom and power. To alleviate the misfortunes of the world the *νοῦς* or first Emanation descended to the earth and became incarnate in Jesus Christ. But the *νοῦς* could not suffer death; he therefore changed forms with Simon of Cyrene who actually suffered in his place. Salvation is purely spiritual, pertaining only to the soul. From this principle according to Irenaeus, Basilides and his followers derived the doctrine of "moral indifference,"—that outer actions, being merely material events, are not in themselves either good or bad.

A widely different account is given by Hippolytus. According to him, "the Father," or the Supreme Being (of whom nothing can be predicated, because his essence is beyond the power of language to express or thought to comprehend) created the *πανσπερμία*, or "seed," which contained in itself the germs or elements of all things: but also, as it were embedded therein, are three degrees or kinds of Divine Sonship, *consubstantial* with the Supreme Being. All things naturally tend towards God, and the first Sonship, which was pure, ascended to "the Father." The second Sonship also strove to ascend, but being less pure, could ascend only part of the way. The third Sonship remained immersed in matter and constituted the spiritual element in the elect. Then from the world-seed there burst forth the great *ἄρχων* or ruler, who ascended as far as the firmament, and, imagining there was nothing beyond, glorified himself as the best and strongest of all beings: but he produced a son wiser and better than himself, by whose aid he laid the foundations of the world. The seat of their rule extended from the upper firmament down to the sphere of the moon (the earth being supposed to be the stationary centre of the universe). The earth and the region beneath the moon are ruled by a second and inferior *ἄρχων*, the God of the Jews, who also had produced a son.

As in all Gnostic systems, freedom is given by the truth, *i.e.*, by a knowledge of the true system of things; and this is given by a series of illuminations. The mind of the son of the higher Archon is enlightened; and he instructs his father, who learns with fear and repentance that there is a sphere of being higher than his own. The light then passes to the son of the lower Archon, who likewise instructs his father. Finally the mind of Jesus was enlightened, and he became Christ, and instructed those of mankind who were able to receive the truth. There are thus three great stages in the world's religious history,—the Ante-Jewish, the Jewish and the Christian. All the souls capable of receiving the light ascend upwards, while their bodies return to the primeval chaos; the minds of all others are shrouded in eternal night, the night of ignorance.

This brief sketch is sufficient to show that the two versions of the system of Basilides are irreconcilable. The various divergent accounts have been the source of much discussion and difference of opinion. It cannot be said the question has yet been satisfactorily settled. And in addition to this, a series of detailed problems is raised by the symbolical and mythological forms in which the ideas are expressed, and which are evidently not all original inventions of the teacher himself.

BIBLIOGRAPHY.—A. S. Peake, "Basilides and the Basilideans" in Hastings, *Encyclopaedia of Religion and Ethics*, vol. ii., together with Hort, art. in Smith-Wace, *Dictionary of Christian Biography*, and Drummond, *Character and Authorship of the Fourth Gospel*, pp. 316-331 (1903). Peake and Drummond defend the originality of Hippolytus, account; Kruger, art. in Herzog-Hauck, *Realencyclopädie*, 3rd ed. rules out Hippolytus and bases his account on the *Acts of Archelaus* and Clement, Irenaeus being taken as secondary. Bousset, *Haupt probleme der Gnosis* (1907), builds on the *Acts of Archelaus*. It may be added that Mansel's *Gnostic Heresies* (1875) is still valuable, and that the sources which have survived are collected by Hilgenfeld, *Ketzergeschichte des Urchristentums* (1884). (S. H. M.)

BASILISK, a name given by the ancients to a horrid monster of their own imagination, to which they attributed the most ma-

ligniant powers and an equally fiendish appearance. The term is now applied, owing to a certain fanciful resemblance, to a genus of lizards belonging to the family *Iguanidae*, the species of which are characterized by the presence, in the males, of an erectile crest on the head, and a still higher, likewise erectile crest—beset with scales—on the back, and another on the long tail. *Basiliscus americanus* reaches the length of one yard; its colour is green and brown, with dark crossbars, while the crest is reddish. This beautiful, strictly herbivorous creature is rather common amidst the luxuriant vegetation on the banks of rivers and streams of the Atlantic, hot lands of Mexico and Guatemala. The lizards lie upon the branches of trees overhanging the water, into which they plunge at the slightest alarm. Then they propel themselves by rapid strokes of the hind limbs, beating the water in a semi-erect position and letting the long rudder-like tail drag behind.

BASIM, a town and subdivision in the Akola district, Berar, India, 52 miles S.S.E. from Akola station of the Great Indian Peninsula railway. Pop. (1921) 10,970. Until 1905 it was the headquarters of the district of Basim which had an area of 2,949 square miles, but in that year the district was abolished, its component *taluks* being divided between the districts of Akola and Yeotmal. The Basim *taluk* consists of a fertile tableland, 1,000 ft. above sea-level, sloping westward and southward to the rich valley of the Penganga river. Since the reduction in status of the district, the town of Basim has declined in importance.

BASIN, THOMAS (1412–1491), bishop of Lisieux and historian, was born probably at Caudebec in Normandy, and in 1447 he became bishop of Lisieux. In 1464 the bishop joined the League of the Public Weal, and the king seized the temporalities of his see. In 1474 Pope Sixtus IV. bestowed upon him the title of archbishop of Caesarea.

Basin's principal work, *Historiae de rebus a Carolo VII. et Ludovico XI. Francorum regibus eorumque in tempore in Gallia gestis*, is of considerable historical value, but is marred to some extent by the author's dislike for Louis XI. At one time it was regarded as the work of a priest of Liège, named Amelgard, but it is now practically certain that Basin was the writer. His other works include a defence of Joan of Arc entitled *Opinio et consilium super processu et condemnatione Johanne, dicte Puellae*.

See the edition of the *Historiae* by J. E. J. Quicherat (1855–59); also G. du F. de Beaucourt, *Charles VII. et Louis XI. d'après Thomas Basin* (1858).

BASIN or **BASON**, a round vessel for holding liquids (the older form, *bacin* is found in many of the Romanic languages, from the Late Lat. *baccinus* or *bacchimus*, probably derived from *bacca*, a bowl). Hence the term has various technical uses, as of a dock constructed with flood-gates in a tidal-river, or of a widening in a canal for unloading barges; also, in physical geography, of the drainage area of a river and its tributaries. In geology, a basin is a broad shallow syncline, *i.e.*, it is a structure proper to the bed rock of the district covered by the term; it must not be confused with the physiographic river basin, although it occasionally happens that the two coincide to some extent. Some of the better known geological basins in England are, the *London basin*, a shallow trough or syncline of Tertiary, Cretaceous and Jurassic rocks; the *Hampshire basin*, of similar formations; and the numerous *coal basins*, *e.g.*, the South Wales coalfield, the Forest of Dean, North Staffordshire coalfield, etc. The Paris basin is made of strata similar to those in the London and Hampshire basins. Lakes sometimes occupy basins that have been caused by the removal in solution of some of the more soluble constituents (rock salt, etc.) in the underlying strata; occasionally lake basins have been formed directly by crustal movements.

BASINET, a diminutive of "basin"; a form of helmet or headpiece. The original small basinet was a light open cap, with a peaked crown. This was used as an alternative to, or even in conjunction with, the large heavy heaume. But in the latter half of the 13th century the basinet was developed into a complete war head-dress and replaced the heaume. In this form it was larger and heavier, had a vizor (though not always a pivoted vizor like that of the later armet), and was connected with the gorget by a "camail" or mail hood, the head and neck thus being

entirely covered. It is always to be recognized by its peaked crown. The word is spelt in various forms, "bassinet," "bascinet," "bacinet" or "basnet." The form "bassinet" is used for the hooded wicker cradle or perambulator for babies (*see* **HELMET**).

BASINGSTOKE, municipal borough, Hampshire, England, 48m W.S.W. of London. Pop. (comprising also Eastrop parish) 12,723 in 1921. The town is placed on the north-east side of the Loddon gap, where the chalk dies down and provides an open way between the London and the Hampshire basins. The neighbourhood is rich in prehistoric antiquities; and the town is a very old foundation. There are traces of Roman occupation. The first recorded historical event is the victory of Aethelred and Alfred over the Danes in 871. It appears in the Domesday survey as a royal manor, with three mills and a market. Charters were granted from the 13th century, and in 1392, as compensation for loss sustained by a serious fire, rights of a corporation were given. Charters of 1622 and 1641 confirmed the mediaeval grants of fairs. The wool trade flourished from an early date, but declined in the 17th century. The church of St. Michael and All Angels is a fine example of late Perpendicular architecture. Close to the neighbouring village of Old Basing are remains of Basing House, famous for its prolonged defence (1643–45) against the parliamentarian forces. A castle occupied its site from Norman times. Basingstoke is chiefly a market town; the main industry is the manufacture of agricultural implements. The Basingstoke canal, which connects the town with the river Wey and so with the Thames, was opened about 1794, but lost its trade owing to railway competition. The town is on the main S.R. line to Salisbury, and has a station on the G.W.R. It is also a road centre of increasing importance. The borough is governed by a mayor, four aldermen and 12 councillors. Area 4,197 ac. It forms part of the Basingstoke parliamentary division of Hampshire.

BASIN-STAND, a piece of furniture consisting of a small stand, usually supported on three legs, and most commonly made of mahogany or rosewood, for holding a wash-hand basin. The smaller varieties were used for rose-water ablutions, or for the operation of hair-powdering. The larger ones, which possessed sockets for soap-dishes, were the predecessors of the ample modern wash-hand stand. Both varieties, often of very elegant form, were in extensive use throughout a large part of the 18th century.

BASKERVILLE, JOHN (1706–1775), English printer, was born at Wolverley in Worcestershire. About 1726 he became a writing master at Birmingham, and he seems to have had a talent for calligraphy and for cutting inscriptions in stone. About the year 1750 he began to make experiments in type-founding, producing types much superior in distinctness and elegance to any that had hitherto been employed. He set up a printing-house, and in 1757 published his first work, a *Virgil* in royal quarto, followed, in 1758, by his famous edition of Milton. In that year he was appointed printer to the University of Cambridge, and undertook editions of the Bible and the Book of Common Prayer. He published a *Horace* in 1762, a second edition appearing in 1770 in quarto; and its success encouraged Baskerville to publish a series of quarto editions of Latin authors, which included Catullus, Tibullus, Propertius, Lucretius, Terence, Sallust and Florus. These books are admirable specimens of typography; and Baskerville is deservedly ranked among the foremost of those who have advanced the art of printing. His contemporaries asserted that his books owed more to the quality of the paper and ink than to the type itself, but the difficulty in obtaining specimens from the Baskerville Press shows the estimation in which they are now held.

See *Memoir* by R. Straus and R. K. Dent (1907); J. H. Benyon, *John Baskerville, type-founder and setter* (1914).

BASKET, a vessel made of twigs, cane, or rushes, as well as of a variety of other materials, interwoven together, and used for holding, protecting or carrying any commodity. The process of interweaving twigs, rushes or leaves, is practised among the rudest nations of the world; and as it is one of the most universal of arts, it ranks among the most ancient industries. The huts of the earliest settlers in Rome and in western Europe generally were made of osier work plastered with clay. Some interesting remains of British dwellings of this nature found near Lewes

in 1877 were described by Major-General H. L. F. Pitt-Rivers in *Archaeologia*, vol. xvi. pp. 456-58. Boats of the same material, covered with the skins of animals, attracted the notice of the Romans in Britain; they seem to have been of the ordinary boat-shape. The basketwork boats mentioned by Herodotus as being used on the Tigris and Euphrates were round and covered with bitumen. Boats of this shape are still used on these rivers, and boats of analogous construction are employed in crossing the rivers of India, in which the current is not rapid. Nor have methods of making much changed. General Pitt-Rivers, on comparing the remains excavated near Lewes with a modern hamper in his possession, found the method to be identical. (T. O.)

PRIMITIVE BASKETRY

The word basket does not occur in Teutonic or Romance languages; its first appearance in the English tongue is in the 13th century, and the modern Celtic words (Welsh, *basged*; Irish, *basceid*, etc.) are probably adapted from the English. Basketry is a convenient, though ill-defined term, including actual baskets, wattlework, matting and ornamental plaitwork, made by hand without the aid of a frame or loom.

The industry is almost universal in time and in space. In the larger areas in which it is not found the lack may be traced either to the scarcity of suitable materials (as in much of Arctic America) or to the substitution of skins (as in the plains of North America, or across central Asia). The antiquity of basket-making is shown by its mention in folklore and creation myths in many parts of the world (Torres straits, Malay area, North America, etc.). The Potawatami (Wisconsin) believe that there is an old woman up in the moon making a basket. When it is finished the world will be destroyed; but a dog from time to time ruins her work (an eclipse), and she has to start over again. Basket-making may well have been the earliest human industry, though the perishable materials are not preserved like flints and potsherds. It certainly preceded pottery-making in western America, and possibly in other parts of the world, and the invention of pottery has been ascribed to the clay coating or lining of baskets, subsequently burnt (*see* POTTERY). But in the Andaman islands A. R. Brown traces evolution in an opposite direction, that of baskets from pottery. Each pot is wrapped up in a covering of leaves in North Andaman; in South Andaman the leaf-covering has become a basket exactly fitting the pot.

The earliest baskets that can be approximately dated are the large circular granaries found embedded in the sand in the Fayum, used for storing grain 4000 or 5000 B.C. (Plate I., fig. 2.); Exodus records the basket (made of papyrus coated with mud) in which the infant Moses was hidden and discovered; Herodotus in the 5th century B.C. describes the round basket-work *gufa* on the Euphrates and Tigris, where similar boats may be seen to-day. Wattle and daub huts—essentially a basket-work process—were characteristic of the bronze age in Britain, and are still a common type of dwelling in many parts of Africa. Nor has basketry technique changed. The strokes used in the baskets in Etruscan tombs, preserved in the Museo Etrusco in Florence, are those used by the English basket-maker; the late Roman baskets of A.D. 300 to 450 dug up at Karanis in 1924-26 are modern in all respects (Pl. I., fig. 1); the method of mat and basket-making found in prehistoric Egypt may be recognized in the tool basket (probably from Portugal) of the English workman.

Uses.—Among uncivilized peoples at the present day, basket-work provides clothing (girdles, petticoats, mats, hats, sandals, ornaments), shelter (wattle-work screens and huts, sleeping mats, cradles), transport (canoes, travelling chairs, coffins), all the domestic furniture, cooking and water vessels, besides many of the fish and game traps, winnowing trays and granaries. The uses are not confined to domestic work. Wicker shields are still used in war, as in the days of Xenophon, while the coir armour of the Gilbert islands, the Hawaiian helmets and the slatted cuirasses of the Indians of north-west America, are dependent on basketry technique. Basketry is still the one industrial art in which human hands excel the machine and can defy mechanical competition; in choice of form, colour and design, the basket-maker can show

true artistic gifts, and the use of symbolism may enshrine magic or religious motives. Further, it is the one art in which the savage excel the civilized. Collections from Africa, Malay and Pacific regions show beauty as well as dexterity, and the North American ware, especially the Californian, is famous throughout the world. The Indian woman takes a personal pride in her work; her status in the tribe is estimated by her skill, and she often reserves her finest work to be buried with her in her grave.

Materials.—The superiority of savage over civilized basket-work is not due solely to hereditary skill, and the disregard of time characteristic of primitive societies; the cause is partly geographical, depending on the basketry materials provided by nature. "The sallow knows the basket-maker's thumb" both in America and England; but while willows, reeds and grass are almost the only native materials found in Great Britain, more than 87 different plants used in making or dyeing Indian baskets were identified in the Agricultural Department at Washington in 1902, and many more are still unidentified. Throughout tropical America, tropical Africa, the East Indian archipelago and the Pacific region various palms provide ideal leaf-strips, as they do in less profusion and variety round the shores of the Mediterranean. In Africa and the Pacific region banana leaves are in common use, and in the latter area screw-pine (*Pandanus*) affords strips for stronger work. Certain materials are characteristic of their respective regions. Such are the spruce (*Picea sitchensis*), of whose split roots water tight baskets are made by the Tlingit of Alaska, the bamboo used in China and Japan, and the "flax" (*Phormium tenax*) of New Zealand. Maiden-hair fern (*Adiantum pedatum*) is as characteristic of Californian decoration as khus-khus grass (*Anatherum muricatum*) of India and the East Indies, or the yellow orchid skin (*Dendrobium*) of New Guinea or Little Andaman. Among other materials may be enumerated the fronds of the palm of the Seychelles, *Lodoicea sechellarum*, which are used for very delicate basket-work in those islands. Esparto fibre is used in Spain and Algeria for rude fruit baskets. Various species of *Maranta* yield basket materials in the West Indies and South America; and the *Trite*, a species of *Calathea*, a member of the order *Zingiberaceae*, is also employed similarly in Trinidad. Baskets are also frequently made from straw, from various sedges (*Cyperus*), and from shavings and splints of many kinds of wood.

Plaited Work.—All basket-work may be described as either (a) *plaited* (or woven), or (b) *coiled*. Plaited basket-work is made by the crossing of two or more sets of elements, often called (by analogy with weaving) warp and weft, although, when the warps are indistinguishable by rigidity or direction, both sets of elements may be called wefts. Its main varieties (illustrated on Plate III.) are: (1) *Check*, in which the warp and weft pass over and under each other singly, like the rand in wicker-work. This includes *wattle-work*, in which the warp stakes are planted in the ground and the weft branches bent in and out between them. (2) *Twilled*, in which each weft passes over and then under two or more warps, producing, by varying width and colour contrasts, endless variety (Pl. I., fig. 5). (3) *Wrapped*, in which flexible wefts are wrapped round (take a circular bend right round) each warp in passing. (4) *Twined*, when two or more wefts pass alternately in front of and behind each of the warps, crossing them obliquely. Twining with two or three wefts is technically "fitting" and "waling" respectively. There are many varieties in twined work, e.g., plain twined and twilled-twined, when two warps are passed (Pl. I., fig. 4) over each time; while warps may be upright, crossed or split. In wrapped-twined, "bird-cage" or lattice-work the foundation consists of both horizontal and vertical elements, often rigid, at the crossings of which the weft or wefts may be wrapped or twined. In finished specimens wrapping and twining are often indistinguishable on the surface, though usually distinguishable on the reverse side. (5) In *hexagonal* work the wefts, instead of being horizontal and vertical, are worked in three directions, forming in open work hexagonal spaces, and in close work six-pointed stars. The well known *Anyam Gila* or "mad weave" of Malacca is a more complicated hexagonal weave, in which the wefts are doubled back, not simply interlaced in the flat. It starts with

BASKETS MADE IN ANCIENT AND MODERN TIMES

1. Late Roman basket, twilled in palm leaf, and found at Karanis, Egypt
2. Large collared basket from Fayum, Egypt, used for storing grain between 5000 and 4000 B.C.
3. Hebridean basket
4. Torres Strait rush basket twined or fitted
5. Collared Nigerian basket
6. Malay presentation rice basket representing a peacock
7. Basket from Borneo, twilled with designs of Ficus, snakes and pigeon-eyes
8. Torres Straits plaited basket, in plain check, made of midrib and pinnules of coconut palm
9. Collared imbricated (Klikitat) basket made by the Thompson river Indians in British Columbia
10. Pima collared basket
11. Twined wallet from Sitka, Alaska

a six-pointed star in the centre, round which other stars are added; and when the basket reaches the upper rim, all the wefts are doubled over a rattan ring and interlaced back again to the point from which they started, the interlacing being assisted by a brass *penysep* (insertor) much like the pricker used in coiled work in America.

THE CRAFT OF BASKETRY, SHOWING THE MAIN VARIETIES OF PLAITED AND COILED WORK

Coiled Work.—The main varieties of known coiled basket work are (1) *Simple oversewn coil*, where each stitch passes over the new coil and pierces a portion of the coil below. (a) *Furcate coil*. If the new stitch splits the stitch in the preceding coil a forked effect is produced, having a superficial suggestion of crochet. (b) *Bee-skep coil*. Sometimes the stitching catches the foundation together at wide intervals, each stitch passing through the foundation just to the right of the stitch in the coil below. If

the stitch passes over two coils it gives a twilled appearance. (c) Sometimes the sewing strip is wound several times round the foundation between every stitch (as in "lazy squaw" below) which may develop into openwork. (2) *Figure of 8*. This, on the surface, looks like the simple oversewn coil, but it is worked in the figure of 8, the stitch passing behind, up and over and down in front of the fresh coil; then behind, down and out under the preceding coil. (3) "Lazy squaw" has a twilled effect; the stitch passes in front, up and over the new coil, winding completely round it once, twice or more times as desired, then passes behind and down under the preceding coil and over the new coil, making the characteristic long stitch. If the sewing is wrapped many times round the foundation for an inch or more, and stitched down only occasionally to the preceding coil, it becomes openwork. (4) *Crossed figure of 8*, also called "Knot-stitch" or *Mariposa*. The stitch passes in front, up and over the new coil, and then behind, down and under the preceding coil, as in the long stitch in "lazy squaw," but the sewing is next brought out between the two coils to the right of the long stitch, which it crosses, giving the appearance of a knot. (5) *Cycloid* or *single-element work* may be grouped with coiled work, but there is no foundation, the coils, usually of cane or similarly independent material, being coiled or looped into each other. This is especially characteristic of the Malay area.

In both plaited and coiled work patterns are made by overlaid wefts, often of contrasting shades or colours, which appear only on the surface. The "Klikitat" or imbricated ware of the Thompson river Indians, British Columbia, gives a good example. The surface weft is doubled back before being stitched to the coil, and the coil-stitch concealed under it (Pl. I., fig. 9).

Decoration and Design.—Symmetry of form, variety in strokes or sewing, contrasts in colour, and definite designs all afford opportunity for artistic expression. Rough baskets for temporary use may be ill-shapen, but in better specimens great care is taken to obtain a pleasing outline, a regular spread, a gradual curve from a square base to a cylindrical body, or to fix the just relation of height to girth. The neat-fingered Malay make presentation rice-baskets in the shape of birds (Pl. I., fig. 6), stepped pyramids or dangling cylinders (to baffle evil spirits), plaited not in simple but in the most complicated strokes, showing extraordinary skill. The varieties of strokes and sewings may be used singly or in combination, making patterns running in bands of varying width, horizontal or vertical. As in the Iban example (Pl. I., fig. 5), these patterns may be emphasized by the use of wefts coloured by nature or artificially dyed. Black wefts are obtained by soaking the strips in black mud, or staining them with elderberry or sumach, oak galls or rusty iron; purple is obtained from amaranth or iris petals; alder roots give orange, berberis yellow; the outer sheath of guinea corn (*Sorghum*) gives the dull red used in Nigeria, and the Indians of Washington mix chewed alder bark and salmon eggs for their vermilion.

Some basket-makers aim only at making attractive baskets, others, perhaps using the same designs, illustrate and enshrine in them religious or magical beliefs, stories of the creation or prayers for good luck. Each design is merely what its maker intends it to be, and can be interpreted only by her. The six-pointed star which is the nucleus of the Malay "mad weave" is the *Pusat Belanai* (navel of the mullet), but the twisted ornamentation represents rice-grains, and the twisted star the flowers of *Mimusops*. Natural and supernatural objects are often represented, e.g., the crab's foot-prints, bending spirit, or shark's wife of Torres straits; the *Ficus*, pigeon's eyes, paddle heads or baited hooks of Borneo (Pl. I., fig. 7); the butterflies and eagles, snakes and raven of the Pacific coast; the grave-house of the Tlingit shaman; the svastika of the Navaho; or the rain-clouds of the Hopi of Arizona.

(A. H. Q.)

MODERN BASKETRY

Since about the middle of the 19th century the character of basket-work in England has been greatly modified. The old English cradle, reticule, and other small domestic wares, have been driven out of the market by cheap goods made on the continent of Europe, and the coarse brown osier packing and hampers have been largely superseded by rough casks and cases made from cheap

imported timber. This loss has, however, been more than counterbalanced by the production of work of a higher class, such as finely made chairs, tables, lounges and other articles of furniture; luncheon and tea-baskets and similar requisites of travel. In addition to the foregoing the chief categories of English manufacture are: vegetable and fruit baskets, transit and travelling hampers, laundry and linen baskets, partition baskets for wine, and protective wicker cases for fragile ware such as glass carboys, stone and other bottles. Wicker shields or cases made from cane pith, for the protection of shells, have been introduced by the English military authorities. Some evidence of the above-mentioned developments is afforded by a comparison of the wages lists of the London Union of Journeymen Basketmakers issued in 1865 and in 1916. The former consists of 87 printed pages; the latter of 164 pages.

A Handicraft.—No machinery is used in basket-making, and every stroke made has a permanent effect on the symmetry of the whole work and no subsequent pressure will alter it. Wages in London vary from 50/- to 70/-, skilled cane-chair workers from £5 to £6 per week. The Basketmakers' Company is one of the oldest craft guilds of the city of London and still exists. Employment is given by the London Association for the Welfare of the Blind to a number of partially or wholly blind workpeople, who are engaged in the making of some of the coarser kinds of baskets; but the work, which bears obvious traces of its origin, is not commercially remunerative, and the association depends for partial support on the contributions of the charitable, and on supplementary sales of fine or fancy work produced under ordinary conditions and largely imported. The materials which are actually employed in the construction of basket-work are numerous and varied, but it is from certain species of willow that the largest supply of basket-making materials is produced. (See OSIER.)

Willows are roughly classed by the basket-maker into "osier" and "fine." The former consists of varieties of the true osier, *Salix viminalis*; the latter of varieties of *Salix triandra*, *S. purpurea* and some other species and hybrids of rougher texture. For the coarsest work, dried unpeeled osiers, known as "brown stuff" are used; for finer work, "white (peeled) stuff" and "buff" (willows stained a tawny hue by boiling them previous to peeling). The rods are used whole for ordinary work, but for baskets of slight and finer texture each is split into "skains" of different degrees of size. "Skains" are osiers cleft into three or four parts, by means of an implement called a "cleave." They are next drawn through an implement resembling the common spokeshave, and in order to bring the split into a shape still more regular, it is passed through another implement called an "upright." The tools required by a basket-maker are few and simple. They consist, besides the foregoing, of a shop-knife for cutting out material; a picking knife for cutting off the protruding butts and tops of the rods after the work is completed; two or three bodkins of varying sizes; a flat piece of iron somewhat narrowly triangular in shape for driving the work closely together; a stout pair of shears and a "dog" or "commander" for straightening sticks. The employer supplies a screw block or vice for gripping the bottom and cover sticks of square work, and a lapboard on which the workman fixes the upsetted bottom while siding up the basket. This is the full outfit. A common round or oval basket may, however, be made with no other tools than a shop-knife and a bodkin. On the continent of Europe shapes or blocks are in use on which the fabric is in some cases woven.

How Baskets Are Made.—The technicalities of basket-making may be easily followed by a glance at the illustration here reproduced by the courtesy of the Society of Arts.¹ It will be seen that the "bye-stakes" are merely inserted in the "upsett," whereas the stakes are driven in at each side of the "bottom-sticks" and pricked up to form the rigid framework of the side. When the "bottom-stick" and "stake" are formed of one and the same continuous rod, it is termed a "league." If the bottom is made on a hoop the butts of the stakes are "sliped," i.e., cut away with

a long cut of the shop-knife, and turned slightly round the hoop; they are then said to be "scalloomed" on. The chief strokes used in constructing an ordinary basket are: the "slew"—two or more rods woven together; the "rand," rods woven in singly; the "fitch," two rods tightly worked alternately one under the other, employed for skeleton work such as cages and waste-paper baskets; the "pair," two rods worked alternately one over the other, used for filling up bottoms and covers of round and oval baskets; and the

CONSTRUCTIONAL PARTS OF A SIMPLE WICKER-WORK BASKET

The process of manufacture to-day differs little from that employed by primitive weavers several thousand years ago

"wale," three or more rods worked alternately, forming a string or binding course. Various forms of plaiting, roping and tracking are used for bordering off or finishing.

An ordinary oval basket is made by preparing the requisite number of bottom sticks, preserving their length greater than the required width of the bottom. They are ranged in pairs on the floor parallel to each other at small intervals, in the direction of the longer diameter of the basket, thus forming what may be called the "woof," for basket-work is literally a web. These parallel rods are then crossed at right angles by two pairs of the largest osiers, on the butt ends of which the workman places his feet; and they are confined in their places by being each woven alternately over and under the parallel pieces first laid down and their own butts which form the end bottom sticks. The whole now forms what is technically called the "slath," which is the foundation of the basket. Next other rods are taken and woven under and over the sticks all round the bottom until it be of sufficient size, and the woof be occupied by them. Thus the bottom or foundation on which the superstructure is to be raised is finished. This latter part is accomplished by sharpening the large ends of as many long and stout osiers as may be necessary to form the stakes or skeleton. These are forced between the bottom sticks from the edge towards the centre, and are turned up or "upset" in the direction of the sides; then other rods are

DETAILS OF A BASKETBALL GAME

1. The start of the game, with ball about to be put into play by the referee. The centre players are in correct position, each standing inside his own half of the inner circle
2. A second after the ball has been put into play. It has been tossed by the referee between the centre players to a height greater than

either of them can jump. If the ball touches the floor without having been tapped by either of the centres after it has reached its highest point, it must be put into play again at the same place

3. An out-of-bounds play. The player to the left has just thrown the ball back into the court, and player No. 18 has made a shot for the basket

woven in and out between each of them, until the basket is raised to the intended height, or, more correctly speaking, the depth it is to receive. The edge or border is finished by turning down the ends of the stakes, now standing up, behind and in front of each other, whereby the whole is firmly and compactly united, and it is technically known as the "belly." A lid is constructed on the same plan as that of the bottom, and tied on with hinges formed of twisted rods; simple handles may be made by inserting similar rods by the sides of two opposite stakes and looping them under the border to form rope-like handles of three strands.

In addition to willows many other materials are employed in the fabrication of wicker-work. Among the more important of these is the stem of *Calamus viminalis* or other allied species (the cane or rattan of commerce) which is used whole or made into skains. Since 1880 the central pith of this material, known as "centre cane" has been largely used in Great Britain and on the continent of Europe in the manufacture of furniture and other finer classes of work. About the same period plaited rush and straw, often coloured, came into use together with enamelled skains of cane. With splits of various species of bamboo the Japanese and Chinese manufacture baskets of unequalled beauty and finish. The bamboo wicker-work with which the Japanese sometimes encase their delicate egg-shell porcelain is a marvellous example of manipulation, and they and the Chinese excel in the application of bamboo wicker-work to furniture. In India "Cajan" baskets are extensively made from the fronds of the Palmyra palm, *Borassus flabelliformis*, and this manufacture has been established in the Black Forest of Germany, where it is now an important and characteristic industrial staple. Although foreign osiers, cane and wood splints are imported into Britain in large quantities, native willows still provide the best material and ware. Much skill is necessary in dealing with such unyielding material; long training and practice are required before well-planned symmetrical baskets can be made; while the larger specimens demand both dexterity and considerable bodily strength. The willows, "osiers" (*Salix viminalis*) and "fine" (*Salix triandra*, *S. purpurea* and others) are treated in various ways to produce different effects. Coarse work such as a common hamper is made with unpeeled osiers, but for better work the rods are peeled, and for fine work they are split into three or four "skains." Contrasting effects are obtained by boiling for a few hours before peeling. Except for the stiff pieces used for bottoms or lids, the rods are all soaked, some for a few hours, some for as long as a week, to render them sufficiently pliable to be bent in and out, and driven securely home.

The chief centres of English basket manufacture outside London are Leicester, East Leake, Newark, Basford near Nottingham, and Grantham. Large but decreasing quantities of light basket-work are made for the English market in Verdun, in the department of the Aisne, and in other parts of France; and great quantities of fancy and other work are produced in Belgium, in the Netherlands and in Germany, notably at Lichtenfels in Bavaria, at Sonnefeld in Saxony and in the Black Forest. The import and export values of baskets and basket-ware, and of willows and rods for basket-making, have been enumerated in the Board of Trade returns for the United Kingdom since 1900, in which year basket-ware from foreign countries was imported to the value of £239,402. In 1926 imports reached £400,300. (T. O.)

See O. T. Mason, "Aboriginal American Basketry" *Rep. U.S. National Mus.* (1904, bibl.), "Vocabulary of Malaysian Basket-work," *Proc. U.S. Nat. Mus.*, vol. xiv. (1908, bibl.); T. Okey, *Art of Basketmaking*.

BASKETBALL is a game played by two teams of five men or women each, in a gymnasium or other large room. Its essential characteristic is the effort of each of the teams to pass the ball through a hoop or goal at the end of the court behind the opposing team. The game of basketball was invented in 1891 by James Naismith, at that time an instructor in the Y.M.C.A. college at Springfield, Mass., and had its inception as a part of the research work of that institution. It differs from all games that preceded it in that they were evolved from simpler forms, while basketball

was the result of a deliberate attempt to invent a game that would fill the same place during the winter season that football and baseball fill in autumn and summer. A first requirement to be met was that the game could be played indoors. Second, it must be attractive enough to hold the interest of the players. Third, it could have little or none of the reputed roughness of football. Accordingly, tackling, body interference and holding with arms and hands were prohibited, and no player was allowed to kick the ball or strike it with his fist. The first ball used was a regulation association football, round, and resembling the present ball but somewhat smaller.

Popularity.—Basketball has spread throughout the world. The Y.M.C.A. secretaries took it as a phase of their athletic

REGULATION BASKET BALL COURT SHOWING PRINCIPAL DIMENSIONS
work to many foreign countries, including Turkey and India. Missionaries, as Gailey and Exner in China and Goodhue in Syria, also aided in its spread abroad. It reached Panama through the builders of the canal, while American soldiers carried it to the Philippines, Germany and France.

Rules.—A synopsis of the present rules is as follows:

(1) *The Court.*—The playing court shall be a rectangular surface free from obstructions and shall have maximum dimensions of 94ft. by 50ft. and minimum dimensions of 60ft. by 35ft.

(2) *The Backboard.*—Backboards must be provided, the dimensions of which shall be 6ft. horizontally and 4ft. vertically. These backboards shall be made of plate glass or wood, or of any other material that is flat and rigid and painted white.

(3) *The Goals.*—The baskets shall be nets of white cord suspended from black metal rings 18in. in inside diameter, set out horizontally 6in. from the backboard and 10ft. from the ground.

(4) *The Ball.*—The ball shall be round; it shall be made of a rubber bladder covered with a leather case; it shall not be less than 30in. nor more than 32in. in circumference; it shall weigh not less than 20 oz. nor more than 23 oz.; and it shall be inflated to 12 lb. air pressure.

(5) *The Players and Substitutes.*—Each team shall consist of five players, one of whom shall be captain.

(6) *The Officials.*—The officials shall be a referee, an umpire, two timekeepers and two scorers.

(7) *Definitions of the Terms Used:*

1. A player is out of bounds when any part of his body touches the boundary-line or the floor outside of the boundary-line.

2. The ball is out of bounds when any part of it touches the boundary-line, the floor or any object outside of the boundary-line, or when it is touched by a player who is out of bounds.

3. A goal is made when the ball enters the basket from above and remains in it or passes through.

4. A held ball is declared when two players of opposing teams have one or both hands firmly on the ball, or when one closely guarded player is withholding the ball from play.

5. A jump ball is the term used when the referee tosses the ball up between two opposing players.

6. Time out is declared whenever the game is legally stopped without the loss of playing time.

7. Own goal is the basket for which a team is throwing.

8. The ball is dead any time when neither side can play it.

9. A pivot takes place when a player who is holding the ball

stops in any direction with one foot; the other foot, called the pivot foot, cannot be moved from its position.

10. Running with the ball is progressing in any direction.

11. A dribble is made by a player giving impetus to the ball by throwing, batting, bouncing, rolling and touching it again before it touches another player.

12. Holding is personal contact with an opponent that interferes with the opponent's freedom of movement.

13. Blocking is changing position for the purpose of impeding the progress of an opponent who has not the ball.

14. A foul is an infraction of the rules involving the penalty of one or more free throws for the other side.

15. A violation is an infraction of the rules not involving a foul.

16. A free throw for goal is the privilege given a team to throw for goal from a position directly behind the free-throw line.

17. Delaying the game is unnecessarily interfering with the progress of the game by a player.

18. An extra period is the extension of playing time necessary to break a tie score.

(8) *Playing Regulations:*

1. The game shall be started by the referee, who shall toss the ball up between two players of opposite teams, as provided in the rules.

2. The game shall consist of two halves of 20 minutes each, with an intermission of ten minutes between halves.

3. The ball may be passed, thrown, batted, bounced, rolled or dribbled in any direction.

(9) *Time Out.*—Time shall be taken out only when ordered by the referee.

(10) *A Held Ball.*—A held ball shall be put in play at the spot by the players in contact with the ball, in a manner similar to that at centre.

(11) *Personal Fouls:*

1. To hold, trip, charge into, or push an opponent.

2. To use unnecessary roughness.

3. To block an opponent.

Philosophy.—Basketball is a team game demanding a high degree of accuracy, judgment, individual skill, initiative, self-control and the spirit of co-operation. It demands that each player be skilled in all phases of the game, thus developing all-round rather than highly specialized ability. Since the object of the game is to have the players of one team put the ball into their own basket and to prevent the opponents from putting it into the other basket, it is frequently necessary for one player to pass the ball to another in order to keep possession of it until a favourable opportunity to make a goal occurs. This necessitates co-operation on the part of the members of the team and skill on the part of each man to score.

Strategy.—All games are divided into attack and defence. In basketball the offence is the more important because so long as the players of one team are able to retain the ball it is impossible for the other team to score. In the offence there are two main objects: first, to put the ball into the basket; second, to play the ball in such a way that it may be caged by some other person or again passed to one who is in a still better position. The watchword for a player on the offence is to keep away as far as possible from his opponent so as to give his team-mates an opportunity to make a clean pass to him, or to get into a position from which he will be able to shoot for a goal. The ball may be passed in any one of several ways: (1) The underhand pass; (2) the overhead pass; (3) the side pass; (4) the push pass, with one or both hands; (5) the bounce; (6) the curve.

The choice of these depends upon the position of the passer's team-mates and of his opponents.

As every man is entitled to his position on the floor, the one who is behind must necessarily circle around his opponent, and is thus at a disadvantage in obtaining the ball, as it comes down the field. The straight pass is used when one's team-mate is nearer than the opponent, and the curve pass is used when the opponent is nearer than the team-mate.

The ball may be passed after a *feint*, which means that the passer leads his opponent to think that the ball is going in one direction

while he plans to put it in another. This *feint* may be made by the passer's looking in one direction and passing in another, or by his making a motion in one direction and passing in another, or in any way to make the opponent think the ball is going in one direction while it is actually going in another.

In dribbling, the ball may be hit with either hand but never with both hands at the same time, nor must it come to rest in one or both hands. In either of these cases the dribble must immediately cease.

The dribble is especially useful where there is no opponent near at hand, where the shot for goal is too far for accuracy, or while the holder's team-mates are planning an opening where the ball may be passed safely. The dribble may be by a few long bounds or by a rapid succession of short ones, thus making progress without having the ball in complete possession, since the opponent can secure the ball without making personal contact. In the dribble, the dribbler is not obliged to continue in a straight line, but may go in any direction on the floor, and may even turn around or pivot as long as he keeps the ball in motion.

The players are divided into three groups—*forwards*, *centres* and *guards*. The duty of the forwards is primarily to make goals; of the guards, to prevent the opponents from making goals and to advance the ball toward their own basket; and of the centres, to put the ball into play and to assist the forwards or guards as necessity arises. Since each player has an opportunity to do the work of the others, a player to be of the greatest service should be expert in all phases of the game.

Forms of Basketball.—Basketball has assumed several forms, adapting itself to different conditions. The girls' game differs from that of the boys' in having the floor divided into two or three courts and in each of the players confining her activities to one space. Another difference is that in the girls' game a player is not permitted, for three seconds, to take the ball away from an opponent who has both hands on the ball. The dribble is limited to one bounce.

The professional game differs from the amateur in three particulars. The court is separated from the spectators by a woven wire enclosure 45ft. by 65ft. in which the game is played. The dribble is unlimited and may be made with one or both hands. The goals are set out 12in. from the backboard instead of 6in. as in the amateur game.

Tournaments.—There are seven national tournaments in which national championships are decided: the inter-scholastic held at Chicago; the amateur national, at Kansas City; the Y.M.C.A., at Buffalo; the Y.M.H.A., at New York; the Catholic, at Chicago; the girls' inter-scholastic, at Wichita, Kan.; and the American Professional League, at Cleveland.

There are four international championships: the American Y.M.C.A., competing against the Canadian; the Far East, including China, Japan and the Philippines, held at Shanghai; the girls' international held at Cleveland; and the South American international.

(J. NA.)

One Goal Basketball.—A form of basketball played where there are not enough participants to make two full teams. This is a game for four or six players. A player of one team is given a basketball. He stands on the free-throw line and is permitted to throw for the goal. If he makes a basket one point is counted for his team and he is permitted to make a second throw. He throws for goal until he misses and then the ball is in play as in a regulation game of basketball. His team mates and opponents scramble for the ball and endeavour to shoot it into the basket. When a player makes a basket, two points are counted for his team and the one who threw it into the goal has earned the privilege of throwing from the free-throw line until he misses. In this game the play is for one goal and the team first making 11 points wins.

(E. D. AN.)

BASLE, a canton of north Switzerland (Ger. *Basel*; Fr. *Bâle*). It is traversed by the Jura, and watered by the Birs and the Ergolz, both tributaries (left) of the Rhine. From 1803 to 1814 the canton was one of the six "directorial" cantons of the confederation. Since 1833 it has been divided into two half cantons, with independent constitutions.

One is that of Basel Stadt or Bâle Ville, including the city and some rural districts north of the Rhine. Its area is 14 sq.m., with estimated population (1925) 143,220, mainly German-speaking and Protestant. The cantonal constitution dates from 1889. Since 1875, 1,000 citizens can claim a popular vote (*facultative referendum*) on all bills, or can exercise the right of *initiative* whether as to laws or the revision of the cantonal constitution.

The other half canton is that of Basel Land or Bâle Campagne, which is divided into four administrative districts and comprises 74 communes, its capital being Liestal. Area, 163 sq.m., with estimated population (1925) 85,550, nearly all German-speaking. The cantonal constitution dates from 1892. The "obligatory referendum" obtains in the case of all laws, while 1,500 citizens have the right of "initiative" whether as to laws or the revision of the cantonal constitution. Each canton-division sends one member to the State council. Together they contribute 11 representatives (on the basis of the 1920 census) to the national council. These, with the executive, are all elected by a direct popular vote for the term of three years. (For industries and bibliography, see **BASLE: Town.**)

BASLE, the capital of the Swiss half-canton of Basel Stadt or Bâle Ville. It is now the second most populous town (ranking after Zürich) in the Swiss confederation, while it is reputed to be the richest. Pop. (1928) 143,100; (with suburbs) 170,000. Both facts are largely due to the opening (1882) of the St. Gotthard railway, as merchandise collected from every part of north and central Europe is stored in Basle previous to being redistributed by that line.

The town had its origin in an *oppidum* of the Rauraci. Its name appears for the first time when the emperor Valentinian built a *castellum*, *Basilia*, i.e., the city by the water in the neighbourhood. Later the name was interpreted as *Basilea*, i.e., the royal city. At the beginning of the 7th century the bishop of Augusta Rauracorum (now called Kaiser Augst), 7½ m. E., moved his see thither. The power of the bishops grew for a long time, but their secular influence was supplanted in the 14th century by that of the burghers. After long swaying between the neighbouring Rhine cities and the Swiss confederation, it was admitted into the latter in 1501. It later became one of the chief centres of the Reformation movement in Switzerland, so that the bishop retired in 1528 to Porrentruy, where he resided till 1792. On the reorganization of the bishopric, a new bishop was established at Soleure in 1828. The 1920 census showed 86,424 Protestants, 43,889 Catholics and 2,513 Jews. As in other Swiss towns the trade guilds got all political power into their hands by the 18th century. They naturally favoured the city at the expense of the rural districts, so that in 1832 the latter proclaimed their independence, and in 1833 were organized into the half-canton of Basel Landschaft, the city forming that of Basel Stadt. The city is divided by the Rhine into Gross Basel (south) and Klein Basel (north). There are several bridges, the old wooden bridge having been replaced in 1905 by one built of stone. The central or main railway station is in Gross Basel, while the German station is in Klein Basel. The most prominent building in the city is the cathedral or munster, built of deep red sandstone, on a terrace high above the Rhine. Consecrated in 1019, it was mainly rebuilt after the disastrous earthquake of 1356 that nearly ruined the city. The public meetings of the great oecumenical council (1431-49) were held in the choir, while the committees sat in the chapter-house. Erasmus lived in Basle 1521-29, and on his death there (1536) was buried in the cathedral. The Rathaus or town hall (restored) dates from the 16th century. In the museum is a fine collection of works of art by Holbein (who lived in Basle from 1528 to 1531), while the historical museum (in the old Franciscan church) contains, among many treasures, the fragments of the famous *Dance of Death*, wrongly attributed to Holbein. The university (founded by Pius II. in 1460) is the oldest in Switzerland; detached buildings include the new schools of physics and chemistry. The university library is very rich, and contains the original mss. of the acts of the great oecumenical council. Basle is the seat of the chief missionary society in Switzerland, the training school for missionaries being at St. Chrischona, 6m. out of the city. It is a great railway,

banking and distributing centre, and has chemical and ribbon works. Shipping on the Rhine has developed greatly since 1923; 738,840 metric tons of merchandise were transported in 1927. The chief commercial fair of Switzerland is held in Basle every April.

BASNAGE, JACQUES (1653-1723), French Protestant divine, was the eldest son of the eminent lawyer Henri Basnage, sieur de Franquenay (1615-95), and was born at Rouen in Normandy on Aug. 8 1653, and died at The Hague on Dec. 22 1723. He studied classical languages at Saumur and afterwards theology at Geneva. He was pastor at Rouen (his native place) from 1676 till 1685, when, on the revocation of the edict of Nantes, he obtained leave of the king to retire to Holland. He settled at Rotterdam as a minister pensionary till 1691, when he was chosen pastor of the Walloon church. In 1709 the grand pensionary A. Heinsius (1641-1720) secured his election as one of the pastors of the Walloon church at The Hague, intending to employ him mainly in civil affairs. He was engaged in a secret negotiation with Marshal d'Uxelles, plenipotentiary of France at the Congress of Utrecht. In 1716 Dubois, who was at The Hague at the instance of the regent Orleans, for the purpose of negotiating the Triple Alliance between France, Great Britain and Holland, sought the advice of Basnage, and the French government also turned to him for help in view of the threatened rising in the Cevennes. True to the principles of Calvin, he denounced the rebellion of the Camisards (*qv*) in his *Instructions pastorales aux Réformés de France sur l'obéissance due aux souverains* (Paris 1720), which was printed by order of the court, and scattered broadcast in the south of France. Basnage died on Sept. 22 1723.

His works include: *Histoire de la religion des églises réformées* (Rotterdam, 1690), the *Histoire de l'église depuis Jésus-Christ jusqu'à présent* (ib. 1699)—both of them written from the point of view of Protestant polemics—and, of greater scientific value, the *Histoire des Juifs* (Rotterdam, 1706, Eng. trans. 1708) and the *Antiquités judaïques ou remarques critiques sur la république des Hébreux* (1713).

BASOCHE or **BAZOCHE**, with the analogous forms **BASOQUE**, **BASOGUE** and **BAZOUGES**, a French gild of clerks, from among whom legal representatives (*procureurs*) were recruited. This gild was very ancient, even older than the gild of the *procureurs*, with which it was often at variance. It dated, no doubt, from the time when the profession of *procureur* (procurator, advocate or legal representative) was still free in the sense that persons rendering that service to others when so permitted by the law were not yet public and ministerial officers. For this purpose there was established near each important juridical centre, a group of clerks, that is to say, of men skilled in law who at first would probably fill indifferently the rôles of representative or advocate. Such was the origin of the Basoche of the parlement of Paris, which naturally formed itself into a gild, like other professions and trades in the middle ages. But this organization eventually became disintegrated, dividing up into more specialized bodies: that of the advocates, whose history then begins; and that of legal representatives, whose profession was regularized in 1344, and speedily became a saleable charge. The remnant of the original clerks constituted the new Basoche, which thenceforward consisted only of those who worked for the *procureurs*, the richer clerks aspiring to attain the position of *procureur*. They all, however, retained some traces of their original conditions. The Basoche had besides its *maîtres des requêtes*, a grand court-crier, a referendary, an advocate-general,

a *procureur-général*, a chaplain, etc. In early days, and until the first half of the 16th century, it was organized in companies in a military manner and held periodical reviews or parades (*mon-tres*), sometimes taking up arms in the king's service in time of war. Of this there survived later only an annual *cavalcade*, when the members of the Basoche went to the royal forest of Bondy to cut the maypole, which they afterwards set up in the courtyard of the Palais. We hear also of satirical and literary entertainments given by clerks of the Palais de Justice, and of the moralities played by them in public, which form an important element in the history of the national theatre; but at the end of the 16th century these performances were restricted to the great hall of the Palais.

To the last the Basoche retained two principal prerogatives: (1) In order to be recognized as a qualified procureur, it was necessary to have gone through one's "stage" in the Basoche, to have been entered by name for ten years on its register. (2) The Basoche had judiciary powers recognized by the law. It had disciplinary jurisdiction over its members and decided personal actions in civil law brought by one clerk against another or by an outsider against a clerk. The Châtelet of Paris had its special Basoche, which claimed to be older even than that of the Palais de Justice, and there was contention between them as to certain rights. The clerks of the procureurs at the *cour des comptes* of Paris had their own Basoche of great antiquity, called the "empire de Galilée." The Basoche of the Palais de Justice had in its ancient days the right to create provostships in localities within the jurisdiction of the parlement of Paris, and thus there sprang up a certain number of local Basoches. Others were independent in origin; among such being the "regency" of Rouen and the Basoche of the parlement of Toulouse.

See also *Répertoire de jurisprudence des Guyot; Recueil des Statuts du royaume de la basoche* (1654), L. A. Fabre, *Études historiques sur les clercs de la basoche* (1856). (J. P. E.)

BASQUE LANGUAGE. The original and proper name of the language is *Eskuara* (euskara, uskara), a word the exact meaning of which has not yet been ascertained but which probably corresponds with the idea "clearly speaking." The language is highly interesting and stands as yet absolutely isolated from other European linguistic families.

Basque has no graphic system of its own and uses the Roman character, either Spanish or French; a few particular sounds are indicated in modern writings by dotted or accented letters. The alphabet would vary according to the dialects. Prince L. L. Bonaparte counts, on the whole, 13 simple vowels, 38 simple consonants. Nasal vowels are found in some dialects as well as "wet" consonants—*ty, dy, ny*, etc. The doubling of consonants is not allowed, and in actual current speech most of the soft consonants are dropped. The letter *r* cannot begin a word, so that *rationem* is written in Basque *arrazoin*.

Declension is replaced by a highly developed post-positional system; first, the definite article itself *a* (plural *ak*) is a post-position—*zaldi*, "horse"; *zaldia*, "the horse"; *saldiak*, "the horses." The declensional suffixes or postpositions, which, just like our prepositions, may be added to one another, are postponed to the article when the noun is definite. The principal suffixes are *k*, the mark of the plural, and of the singular nominative agent; *n*, "of," and "in"; *i*, "to"; *z*, "by"; *ik*, "some"; *ko*, "from," "of" (Lat. *a*); *tik*, "from" (Lat. *ex*); *tzat*, *kotzat*, *tzako*, "for"; *kin*, *gaz*, "with"; *gatik*, "for the sake of"; *gana*, "towards"; *ra*, *rat*, "to," "into," "at," etc. Of these suffixes some are joined to the definite, others to the indefinite noun, or even to both.

The personal pronouns are *ni*, "I"; *hi*, "thou"; *gu*, "we"; *zu*, "you"; in modern times, *zu* has become a polite form of "thou," and a true plural "you" (i.e., more than one) has been formed by suffixing the pluralizing sign *k*—*zuek*. The pronouns of the third person are mere demonstratives. There are three: *kura* or *kura*, "that"; *hau* or *kau*, "this"; *ori* or *kori*, "this" or "that." Other unexplained forms are found in the verbal inflections, e.g., *d*, "it," and *t*, "I" or "me"; *d-akus-t*, "it see I" = "I see it"; *d-ur-rat-t*, "it follows me." The demonstratives are used as articles—*gast-en-ur*, "this younger one"; *andre-ori*, "this lady at some dis-

taunce." The reflective "self" is expressed by *buru*, "head." The relative does not exist, and in its place is used as a kind of verbal participle with the ending *n*: *doa*, "he goes"; *doana*, "he who is going"; in the modern Basque, however, by imitation of French or Spanish, the interrogative *zein*, *zoin*, is used as a relative. Other interrogatives are *nor*, "who"; *zer*, "what"; *zembait*, "how much," etc. *Bat*, "one"; *batzu*, "several"; *bakotch*, "each"; *norbait*, "some one"; *hanitz* or *hainitz*, "much"; *elkar*, "both"; are the most common indefinite pronouns. The numeral system is vigesimal; e.g., 34 is *hogoi ta hamalaur*, "20 and 14." The numbers from one to ten are: 1, *bat*; 2, *bi*; 3, *hiru*; 4, *lau*; 5, *bortz* or *bost*; 6, *sei*; 7, *zazpi*; 8, *zortzi*; 9, *bederatzi*; 10, *hamar*; 20, *hogoi* or *hogei*; 40, *berrogoi* (i.e., twice twenty); 100, *ehun*. There is no genuine word for a thousand.

The genders in Basque grammar are distinguished only in the verbal forms, in which the sex of the person addressed is indicated by a special suffix; so that *eztakit* means, "I do not know it"; but to a woman one says also: *eztakinat*, "I do not know it, O woman!" To a man one says: *eztakiat* (for *eztakikat*), "I do not know it, O man!" Moreover, certain dialectic varieties have a respectful form: *eztakizut*, "I do not know it, you respectable one," from which also a childish form is derived, *eztakichut*, "I do not know it, O child!"

The Basque conjugation incorporates not only the subject pronouns, but, at the same time, the indirect and direct complement. Each transitive form may thus offer 24 variations—"he gives it," "he gives it to you," "he gives them to us," etc., etc. Primitively there were two tenses only, an imperfect and a present, which were distinguished in the transitive verb by the place of the personal subject element: *dakigu*, "we are knowing it"; (*gu*, i.e., we), and *ginaki*, "we were knowing it"; in the intransitive by a nasalization of the radical: *niz*, "I am"; *nintz*, "I was." In modern times a conjectural future has been derived by adding the suffix *ke*, *dakiket*, "I will, shall, or probably can know it." No proper moods are known, but subjunctive or conjunctive forms are formed by adding a final *n*, as *dakusat*, "I am looking at it"; *dakusadan*, "if I see it." No voices appear to have been used in the same radical, so that there are separate transitive and intransitive verbs.

In its present state Basque only employs its regular conjugation exceptionally; but it has developed, probably under the influence of neo-Latin, a most extensive conjugation by combining a few auxiliary verbs and what may be called participles, in fact declined nouns; *ikusten dut*, "I have it in seeing," "I see it"; *ikusiko dut*, "I have it to be seen," "I will see it," etc. The principal auxiliaries are: *izan*, "to be"; and *ukan*, "to have"; but *edin*, "to can"; *eza*, "to be able"; *egin*, "to make"; *joan*, "to go"; *eroan*, "to draw," "to move," are also much used in this manner.

The syntax is simple; the phrases are short, and generally the order of words is: subject, complement, verb. The determining element follows the determined: *gizon handia*, "man great the"—the great man: the genitive, however, precedes the nominative—*gizonaren etchea*, "the man's house." Composition is common and it has caused several juxtaposed words to be combined and contracted, so that they are partially fused with one another—a process called *polysyntheticism*; *odei*, "cloud," and *ots*, "noise," form *odots*, "thunder"; *belar*, "forehead," and *oin*, "foot," give *belain*, "knee," front of the foot. The vocabulary is poor; general and synthetic words are often wanting, but particular terms abound. There is no proper term for "sister," but *arreba*, a man's sister, is distinguished from *ahizpa*, a woman's sister. We find no original words for abstract ideas, and God is simply "the Lord of the high."

The vocabulary, however, varies extremely from place to place and the dialectic varieties are very numerous. They have been summed up by Prince L. L. Bonaparte as eight; these may be reduced to three principal groups: the eastern, comprising the Souletine and the two lower Navarrese; the central, formed by the two upper Navarrese, the Guipúzcoan and the Labourdine; and the western, formed by the Biscayan, spoken, too, in Álava. These names are drawn from the territorial subdivisions, although the dialects do not exactly correspond with them.

BIBLIOGRAPHY.—See Wm. Rollo, *The Basque Dialect of Marquina* (1925); Meillet and Cohen, *Les Langues du Monde* (1926); W. Schmidt, *Die Sprachenfamilien und Sprachenriesen der Erde* (1927), both for detailed bibliography and for a discussion of its relationships.

BASQUE PROVINCES (*Provincias Vascongadas*), a division of north-eastern Spain in the angle of the Bay of Biscay, comprising the three provinces of Alava, Vizcaya or Biscay and Guipúzcoa. (Pop. 1925, 811,400; area, 2,739 square miles.) The boundary of the Basque provinces extends south-westwards from the French frontier at the Bidassoa, along the Pyrenean foothills and the Sierra de Aralar, and across the western part of the Sierra de Andia to the Ebro at Logroño, whence it follows the river to Paentelarra beyond Miranda and then goes northward to the sea on the fringe of the highlands leaving the basin of the Nervion in Vizcaya. The area thus included forms a triangle with its base at the coast, each side measuring approximately 70m. in a straight line. In every way the two maritime provinces of Vizcaya and Guipúzcoa stand out in contrast to the inland Alava. Guipúzcoa, in particular, remains most intensively Basque, though the growth of San Sebastian and the increased use of the coastal route from France tend to weaken their cultural continuity. In Vizcaya, too, industry produces the same effect. (See under the separate provinces; also **BASQUE LANGUAGE**; **EUROPE: Races and Peoples**) The combined area of the two northern provinces is little more than that of Alava, but their population is seven times as great. This concentration on the more fertile coastlands has been a feature of settlement in Spain from the earliest times. Inland, the boundary with Alava is clearly defined; it runs along the hill-lines which represent the local weakening of the great Tertiary mountain-building forces that produced the Pyrenees to the east and the Cantabrians to the west. To the north of this lies a very broken country of rounded gorse-covered hills, ending seawards in high cliffs, and deeply cut wooded valleys dotted with the large Basque homesteads, well watered throughout the year and having not less than 40in. of rain per annum. Movement from east to west is extremely difficult, and this fact, together with the presence of excellent harbours, such as that of Pasajes, early brought coastwise communications into prominence. It resulted, further, in the preservation of the physical type and ancient culture of the Basques, for penetration into Spain until the 17th century was almost solely confined to the Pyrenean passes of Navarre, notably Roncevaux (*q v.*).

The contrast with Alava is great. The climatic boundary corresponds to the physical, and lies along the edge of the high, tributary basin which slopes southwards to the Ebro and includes the fertile open plains of Vitoria. Alava is thus comparatively dry (though the rainfall is fairly evenly distributed) and exposed to the extremes of temperature which characterize the Spanish "meseta." The wooded valleys of the coastal strip are rare in Alava, and the vegetation takes on the character which belongs to regions of hot dry summers. The province has similarly lain open to human penetration, and it is interesting to note that the Basque language is here weakest. Its capital, Vitoria, is said to have been founded by the Gothic king, Leovigild (581). Throughout the middle ages, while the coast was comparatively unaffected by the great movements of men and culture, Alava was influenced in many ways, since it lay on the northern flank of the pilgrim route from Pamplona to Santiago through Logroño.

HISTORY

In Biscay the counts of Haro were lords of Biscay from 1093

BY COURTESY OF LE VOYAGEUR EN FRANCE, INC.

INHABITANTS OF THE BASQUE PROVINCES IN THE COSTUMES WHICH THEY STILL RETAIN AND WHICH FOR MANY CENTURIES HAVE DISTINGUISHED THEM FROM THE OTHER PEOPLES OF SPAIN

to 1350. There was a short union with Castile under Pedro the Cruel, but the definitive union did not take place till 1370. In Alava the ruling power was the confederation of Arriaga, which united the province to the crown of Castile in 1332. Guipúzcoa, which had been dependent sometimes on Navarre, sometimes on Castile, was definitively united to Castile in 1200. From the year 1425 the provinces were desolated by party wars among the lesser nobles (*parientes mayores*) but these came to an end in 1460-98, when Henry IV. and Ferdinand the Catholic strengthened the power of the towns and forbade the erection of any fortified house in the country. Though the three Basque Provinces were thus united to the crown of Spain, they still remained a land apart (*tierra apartada*). Their juntas acted to some extent in common; and although no written federal pact is known to have existed, they employed, as the symbol of their unity, a seal with the word *Iruacbai*, "The Three One," engraved upon it. They preserved their own laws and customs, which the Spanish kings swore to observe and maintain. Unless countersigned by the juntas, the decrees of *cortes* and Spanish legislation or royal orders had no force in the provinces. In the junta of 1481 Guipúzcoa alone proposed a treaty of friendship, peace and free trade for ten years with England, and this was signed in Westminster on March 9, 1482 (see Rymer, *Foedera*). The Basques are mentioned apart from Spain in the Treaty of Utrecht (1713), and long preserved in their municipal institutions the old style of *republicas*.

This kind of independence and autonomy lasted until the death of Ferdinand VII. in 1833, when, in default of male heirs, his brother, Don Carlos, claimed the throne, and raised the standard of revolt against his niece, Isabel II. The ensuing wars ended in 1876 in the utter defeat of the Carlist forces, and left the provinces at the mercy of the Government. In general government and legislation the provinces were then assimilated to the rest of Spain, the provincial parliaments (*diputaciones*) being elected like the other provincial councils of Spain, and subjected to the ordinary interference of the civil governors. But their representatives, assisted by the senators and deputies of the Basque Provinces in the Cortes, negotiated successive pacts, each lasting several years, securing for the three provinces their municipal and provincial self-government, and the assessment, distribution and collection of their principal taxes and octroi duties, on the understanding that an agreed sum should be paid annually to the State. In Dec. 1906, the contribution of the Basque Provinces to the State was fixed as follows: for 1906-16 at 8,500,000 pesetas; for 1917-26 at pts 9,000,000, the province of Guipúzcoa paying an additional 700,000 pesetas. These pacts have been scrupulously observed. In 1926 a new agreement was concluded for the period of 1927-51, under which the total annual contributions are as follows: 1927-31, pts 40,000,000; 1932-36, pts 40,500,000; 1937-41, pts 41,000,000; 1942-46, pts 42,500,000; 1947-50, pts. 45,000,000; 1951, pts 50,000,000.

In agriculture the Basque Provinces are great cider countries and the apple is the characteristic fruit tree. During the 19th century, however, wine-growing increased; it has long been famous in Alava. The chief industries are the sea fisheries and iron mining. Some of the mines round Bilbao have been worked from prehistoric times. In 1926 the Basque Provinces produced 1,360,000 metric tons of iron ore, for which Great Britain is the principal market. The swords of Mondragon in Guipúzcoa were renowned before those of Toledo. In the 19th century Señor Zuloaga successfully revived at Eibar the artistic inlaying of gold and silver in steel and iron. In the 20th century great strides have been made in harnessing streams to produce electric power for application to industry.

BIBLIOGRAPHY—Of older works, R. P. Henao's *Averiguaciones de las Antigüedades de Cantabria* (1688, new ed 1804), is valuable. For the manners and customs of the people see R. P. M. de Larramendi, S.J., *Corografía de Guipúzcoa* (written about 1750, it was first printed in Barcelona in 1882; later ed. 1896). There are excellent chapters on the Basque Provinces in the *Introducción a la Historia Natural, y a la Geografía Física de España*, by D. Guillermo Bowles (1775). *El Guipuzcoano instruido* (1780), in the form of a dictionary, gives full details of the life, rights, duties and obligations of a Basque citizen of that date. The *Diccionario Geográfico-Histórico de España*, tome i., ii.

(1802) is full of local information. The best works on the various editions of the *fueros* are: A. Marichalar, *Marques de Montesa, and Cayetano Manrique, Historia de la Legislación . . . civil de España* (1863); *Fueros de Navarra, Vizcaya, Guipúzcoa y Alava* (Madrid, 2nd ed., 1868); D. Pablo de Gorosabel *Noticia de las cosas memorables de Guipúzcoa* (1899-1901), the last volume of which, by C. de Echegaray, gives the legislative acts down to May 1900; D. Carmelo de Echegaray, *Las Provincias Vascongadas a Fines de la Edad Media* (1895); Dr. E. de Labayru, *Historia de Bizcaya* (1903); G. de Balparda, *Historia critica de Vizcaya y de sus Fueros* (1924). Several discoveries of important missing documents and mss. were made in the process of cataloguing and indexing the archives of the towns. The development of the Basque mining industry is described in *Las Minas de hierro de la provincia de Vizcaya, progresos realizados en esta region desde 1870 hasta 1899* (1900).

BASRA (also spelt BUSRA, the BASSORAH of the Arabian Nights), the name of a vilayet (pop. [1920] 785,600) and of the third most important town in 'Iraq and its port (pop. [1927], 85,000). The original city was founded by Caliph Omar in A.D. 636 at Zobeir, about 8m. from the modern town. Bassorah was famous in the time of Hārūn al-Rashīd but declined in importance with the decay of the Abbasid caliphs. As time went on the canals were neglected and finally as the silt accumulated all communication with the Persian gulf was cut off. The town was taken by the Turks in 1668 and has since undergone many changes of fortune till, finally during the World War, Basra once more came to its own as the port whereby communication was kept up between Mesopotamia and India. Many improvements have been effected since, and both town and port are growing in importance.

Position and Geographical Relations.—The town lies near the western bank of the Shatt-al-Arab (*q.v.*) in long. 47° 34' E. and lat. 32° N., the actual port being about 75m. from the Persian gulf. It is connected with Baghdad by a railway running along the Euphrates and by the Tigris, the Euphrates being navigable only in stretches. Of the ocean-going steamers which proceed up to Shat-al-Arab only about a third reach Basra, the remainder stopping at Abadan some 35m. away. The growth of the deltaic region of the rivers has been continuously threatening Basra, as in former days Eridu was threatened, but engineering works at the Fao bar have, however, at least for a time assured the continuance of the port. There is now 17ft. of water at low tide and over 26 at high.

In the following table we give the tonnage figures for the port of Basra in thousands of tons, the trade of Abadan being about three times as great. Apart from these two outlets Iraq has no trade channel on the gulf, other merchandise passing either by caravan, car or aeroplane. The principal export from Basra is dates, but there is growing trade in wheat from Mosul, which is likely to increase when communications by rail in the north are improved.

Year	Imports	Exports	Total Tonnage
1920-21	455	7	462
1921-22	374	66	400
1922-23	354	306	660
1923-24	400	488	888
1924-25	372	313	685
1925-26	364	230	594

An aeroplane service is being developed, for Basra lies on the air line from Europe to India; it is also one of the links in the Imperial wireless chain, and is in touch with Cairo. Much attention has been paid to the health of the city, which now possesses a well equipped hospital (the Maude Memorial hospital), and some progress has been made in rebuilding and paving the town and also in carrying out a survey of the neighbourhood.

See besides the general works of reference and the annual Colonial Office reports, F. E. Crow, *The Cultivation of Dates in Mesopotamia*. (L. H. D.-B.)

BAS-RHIN, a department of eastern France, formed originally after the French Revolution and resuscitated in 1919. From the war of 1870-71 until that of 1914-18 it was included in the German imperial territory of Alsace-Lorraine (*q.v.*), of which it formed the north-eastern portion. It is bounded on the east by the Rhine, which runs in a general north-north-easterly direction, north by the Bavarian Palatinate, north-west by the department of Moselle, west by that of Vosges and south by that of Haut-Rhin.

The Rhine is joined within the department by the Ill, which follows a long northward course parallel to the main river and is joined at Strasbourg by the Bruche, the fertile valley of which cuts to the west of the Hochfeld *massif* (1098 metres) in the south-west corner of the department. Beyond Saverne, the Zorn comes in from Moselle, and flows east until joined by the Moder, when it turns north-east parallel to the Rhine before joining it. A similar tendency is to be seen in the lower course of the Sauer which rises over the northern border in the Palatinate. Here also rises the Lauter, which forms the northern frontier for some twelve miles. Structurally the area is best understood as part of Alsace, the region between the Vosges and the Rhine, with this important point of difference from Haut-Rhin—that the hills to the west, and with them the boundary, are nothing like so definite. From the south-west corner at Saales, it is true, the steep wooded flanks of ancient hills that form a prolongation of the Vosges reach heights of over 1,000 metres (as in the Donon), but beyond the Zorn valley begins the broken country which constitutes the north-western portion of the department, including the rectangular lobe which it pushes west to embrace a portion of the upper Saar valley. Historically this region, with its heavily forested Triassic sandstones, has ranked as a thinly peopled "zone of difficulty"; and the importance of the pass by Saverne to Lorraine was therefore greatly enhanced. A wide strip between the hills and the Rhine is composed of rich alluvial soils, with fertile stretches of *loess* (Kochersberg) between Saverne and Strasbourg. Notably the ancient thoroughfare from Bavaria around the north of the Black Forest finds its natural end here in the patches of loess, the last of a long series from Central Europe.

Population is densest in and about Strasbourg which, with its unique system of canals, is the great industrial, commercial, educational and administrative centre of the department: it is scantiest in the Forest of Haguenau, in the Vosges and along the north-west border. Strasbourg (*q.v.*) derives its importance from its site at the natural limit of Rhine navigation (though it lies west of that river, on the Ill) and within reach of the historic routes to Lorraine and the Paris Basin. The Col de Saverne concentrates canal, road and rail traffic along this line. To the north the Moder valley carries the railway from Haguenau to the Saar. The Rhine is followed, though at a distance of from 2-5 m., by the main line to Mannheim, with branches to Haguenau and Karlsruhe. Most of the towns of the department are either on the plain or at the edge of the hills, but all are dwarfed by the capital. Strasbourg had 164,136 inhabitants in 1926: other chief towns are Schiltigheim (18,513), Haguenau (13,503), Bischheim (7,900), Sélestat (8,971), Bischwiller (6,980) and Saverne (6,954). The department is divided into 8 *arrondissements*, 35 cantons and 561 communes. The area is 3,508 sq.km.; pop. (1926) 670,985.

BASS, the name of a family of English brewers. The founder of the firm, William Bass (b. 1720), was originally a carrier, who, seeing the growing demand for Burton beer, started in 1777 as a brewer himself. The principal market for Burton beer at that time was in St. Petersburg [Leningrad], but in 1822 the Russian government placed a prohibitory duty on Burton ales, and the brewers were forced into cultivating the home market. William Bass opened up a connection with London, and established a fairly profitable home trade. A misunderstanding between the East India Company and the London brewers who were the proprietors of Hodgson's India pale ale, at that time the standard drink of the Englishmen in the East, resulted in Bass being asked to supply a beer which would withstand the Indian climate and be generally suitable to the Indian market. After a series of experiments he produced what is still known as Bass's pale ale. This new and lighter beer at once became popular all over India, and Bass's firm became the largest in Burton. After William Bass's death the business was carried on by his son, M. T. Bass, and then by his grandson, Michael Thomas Bass (1799-1884). In 1827 a vessel laden with Bass's beer was wrecked in the Irish Channel. A large proportion of the cargo was, however, salvaged and sold at Liverpool, where it met with great approval in the local market, and through this chance circumstance the firm opened up a regular trade in the north-west of England and Ireland. "Bass" was, however, little drunk in London till 1851, when it was supplied

on draught at the Exhibition of that year, since which time its reputation has been world-wide. In 1880 the business was turned into a limited liability company. On the death of Michael Thomas Bass, who was a man of great public spirit, the control of the firm passed to his sons, Michael Arthur Bass and Hamar Bass (d. 1898). Michael Arthur Bass (1837–1909), after 21 years in parliament as member first for Stafford, then for two divisions of Staffordshire, was in 1886 raised to the peerage as Baron Burton, the peerage descending to his daughter Nellie (Mrs. J. E. Baillie), Baroness Burton.

BASS (*Morone labrax*), a fish of the sea-perch family (*Serranidae*) found in the Mediterranean and on the Atlantic coasts of Europe. It is a silvery, blue-backed fish, with a strong spinous dorsal fin; it grows to 3ft. in length. Bass swim in shoals near the coasts and often ascend rivers. There are four American species of *Morone*, and the name bass is also given in America to other sea-perches, as well as to the black bass (*Micropterus*) fresh-water fishes of the family *Centrarchidae*.

BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY
THE SMALL-MOUTHED BLACK BASS
(*MICROPTERUS DOLOMIEU*)

BASS (the same word as "base" and so pronounced, but influenced in spelling by the Ital. *basso*), deep, low, especially in music, the lowest part in the harmony of a composition, the lowest male voice, or the lowest-pitched of a class of instruments, as the bass-clarinete.

Bass or bast (a word of doubtful origin, pronounced *bās*) is the fibrous bark of the lime-tree, used in gardening for tying up plants, or to make mats, soft plaited baskets, etc. Basswood is the American lime-tree, *Tilia americana*; white basswood is *T. heterophylla*.

BASSA, district of Northern Nigeria, occupying the angle made by the meeting of the Benue river with the Niger. It lies south of the Benue and east of the Niger. It is heavily forested, and has not been penetrated by Moslem influence. The Bassas are a remarkable pagan race who are to be found in small colonies in almost every province of Northern Nigeria. They are clever agriculturists, naturally peaceful and industrious. Other tribes of the district, the Munshi and the Okpoto, are of a turbulent and warlike disposition. In 1903 the murder of the British resident led to punitive measures, and finally to the full establishment of British authority and the suppression of the slave trade. At first a separate province, Bassa is now part of Kabba province.

BASSANO, JACOPO, or GIACOMO DA PONTE, (1510–1592), Venetian genre painter, was born at Bassano in 1510, and died there on Feb. 13, 1592. He was first a pupil of his father, Francesco da Ponte, then of Bonifazio Veneziano in Venice, a follower of the school of Titian. His subjects were generally peasants and villages, cattle and landscape, with some portraits and historical subjects. One of his earliest subjects was "Samson slaying the Philistines"; the remains of this fresco can still be seen on the outside of the Casa Michieli, Venice; he painted portraits of Sebastiano Venerio Doge of Venice, Tasso, Ariosto, etc. His genuine works are somewhat rare and valuable, many of those which are called originals, being copies either by his sons or by others. Bassano's style varied considerably during his lifetime; at first his style was modelled on his father's, and he was then strongly influenced by Titian before he developed his own characteristic manner. Although he painted few great pictures, his altarpiece of the Nativity at Bassano is estimated highly by the best judges, and in Lanzi's opinion is the finest work of its class. One of his best pictures is the "Good Samaritan" in the National Gallery, London, where there is also "A Portrait of a Gentleman," and "Christ Driving the Money Changers out of the Temple." There are also pictures by him at Dublin, Florence, Milan, Naples, in the Louvre and at Venice. His four sons were all painters, and assisted their father: Francesco (1543–91); Giovanni Battista (1553–1613); Leandro (1558–1623), and Girolamo (1540–1622). Pictures by Leandro are at Dresden, Dublin, Madrid, Munich and Venice.

See Hadeln Detle van Baron, *Über die zweite manier des Jacobo Bassano* (1914).

BASSANO, town of Venetia, Italy, province of Vicenza, 24m. N.E. of Vicenza and 30m. N. of Padua, at the foot of the Venetian Alps. Pop. (1921) town, 10,111; commune, 19,959. The Brenta is here spanned by a covered wooden bridge, and commands fine views. The 13th century castle of the Ezzelini (of German origin) stands above the river with a tower, erected by one of the family. The museum and cathedral and some churches contain pictures by the da Ponte family (16th and early 17th centuries) surnamed Bassano from their birthplace; Jacopo is the most eminent of them. The museum also contains drawings and letters of the sculptor Antonio Canova. The church of S. Francesco shows remains of 12th century Lombard Romanesque and 13th century Gothic architecture. Some houses have traces of paintings on the façades. Bassano is first mentioned as a village in a document of 1085, and as a "castello" (fortified place) in 1175. At the beginning of the 15th century, it went over to Venice and its printing-press and manufacture of majolica flourished; the latter still continues.

See G. Gerola, *Bassano* (Arti Grafiche, Bergamo, 1910)—well illustrated.

The town was the scene of a battle won by the French Army of Italy under Napoleon Bonaparte against the Austrians under Marshal Wurmser on Sept. 8, 1796. At the end of August Bonaparte decided to attack the Austrians, who after their defeat at Castiglione (*q.v.*) had withdrawn into Tirol, and were preparing for a new offensive to relieve Mantua. Collecting 30,000 men, he defeated their right wing, occupied Trent, and turning eastwards into the upper Brenta valley, came down on to the rear of Wurmser just as the latter was concentrating his centre at Bassano and pushing forward his left towards the middle Adige. The scattered Austrian detachments were defeated in a series of combats, and on Sept. 8 the French, advancing down the valley with Masséna on the left bank of the Brenta and Augereau on the right bank, in all 15,000 men, found the main enemy army, 11,000 strong, massed north of the town of Bassano, covered by advanced troops on either bank. These forward troops were rapidly driven in, and Masséna, pressing forward on their trail, seized the Brenta bridge and broke into the town, menacing the left and rear of the Austrian main position, which was being simultaneously attacked in front by Augereau. Wurmser was driven back in disorder to the south, losing 3,000 prisoners and 35 guns, and, his line of retreat to Trieste being cut, had no other recourse but to recross the lower Brenta and throw himself, with the remnant of his army, into Mantua. Here he was at once attacked and shut in, only a few thousand men, who had succeeded in escaping eastward from the battlefield, remaining in the open field. The addition of Wurmser's forces to the garrison of Mantua merely increased the drain on the limited supplies in the fortress, and the Austrians were compelled to collect a new army for its relief. (See further FRENCH REVOLUTIONARY WARS.)

BASSARAB or BASSARABA, the name of a dynasty in Rumania which ruled Walachia from the dawn of its history until 1658. The origin of the name and family has not yet been explained. It undoubtedly stands in close connection with the name of the province of Bessarabia, which oriental chroniclers gave in olden times to the whole of Walachia. The heraldic sign, three heads of negroes in the Bassarab shield, seems to be of late western origin and to rest on a popular etymology connecting the second half of the word with Arabs, who were taken to signify Moors (blacks). The other heraldic signs, the crescent and the star, have evidently been added on the same supposition of an oriental origin of the family. The Serbian chroniclers connect its origin with their own nationality, basing this view upon the identification of Sarab with *Sorb* or *Serbia*. All this is mere conjecture. It is, however, a fact that the first appearance of the Bassarabs as rulers (*knyaz*, *ban* or *voivod*) is in the western part of Rumania (originally called Little Walachia), and also in the southern parts of Transylvania—the old dukedoms of Fogarash and Almash, which are situated on the right bank of the Olt (Aluta) and extend south to Severin and Craiova. Whatever the

origin of the Bassarabs may be, the foundation of the Walachian principality is undoubtedly connected with a member of that family who, according to tradition, came from Transylvania and settled first in Câmpulung and Tîrgovishte. It is equally certain that almost every one of the long line of princes and voivods bore a Slavonic surname, perhaps due to the influence of the Slavonic Church, to which the Rumanians belonged. Starting from the 13th century, the Bassarabs soon split into two rival factions, known in history as the descendants of the two brothers Dan and Dragul. The form Drakul—devil—by which this line is known in history is no doubt a nickname given by the rival line. It has fastened on the family on account of the cruelties perpetrated by Vlad Drakul (1433–46) and Vlad Tsepesh (1456–76), who figure in popular legend as representatives of the most fiendish cruelty. The feud between the rival dynasties lasted from the beginning of the 15th century to the beginning of the 17th.

The most prominent members of the family were Mircea (1386–1418), who accepted Turkish suzerainty; Neagoe, the founder of the famous cathedral at Curtea de Argesch (*q.v.*); Michael, surnamed the Brave (1592–1601); and Petru Cercel, famous for his profound learning, who spoke 12 languages and carried on friendly correspondence with the greater scholars and poets of Italy. He was drowned by the Turks in Constantinople in 1590 through the intrigues of Mihnea, who succeeded him on the throne of Walachia. The British Museum possesses the oldest mss. of the Rumanian Gospels, once owned by this Petru Cercel, and containing his autograph signature. The text was published by Dr. M. Gaster at the expense of the Rumanian government. Mateiu Bassarab (1633–54) established the first printing-press in Rumania, and under his influence the first code of laws was compiled and published in Bucharest in 1654. The Bassarab dynasty became extinct with Constantine Sherban in 1658. (See RUMANIAN LANGUAGE and RUMANIAN LITERATURE. (M. G.)

BASSARI, a west African tribe, well-set-up, prognathous, patrilineal, animistic people of medium stature, living in the Bassari district, northern Togoland. Their language is related to Losso. They have head chiefs and village chiefs taken from among the notables. The extended family group embraces several households living together. Land is held in common with individual ownership of personal property. They are cultivators and cattle-raisers, and employ neighbouring Fulani families as herdsmen.

See Klose, *Togo unter deutscher Flagge* (1899).

BASS CLARINET is practically the A, Bb, or C clarinet speaking an octave lower; what therefore has been said concerning the fingering, transposition, acoustic properties, and general history of the clarinet (*q.v.*) also applies to the bass clarinet. Owing to its greater length the form of the bass clarinet differs from that of the other clarinets in that the bell joint is bent up in front of the instrument, terminating in a large gloxinia-shaped bell, and that the mouthpiece is attached by means of a strong ligature and screws to a serpent-shaped crook of brass or silver.

The quality of tone is less reedy in the bass clarinet than in the higher instruments. It resembles the bourdon stop on the organ, and in the lowest register, more especially, the tone is somewhat hollow and wanting in power, although it is, curiously enough, mellower than that of the bassoon.

The low pitch of the bass clarinet (8ft. tone) contrasted with the moderate length of the instrument—the bore of which measures only some 42 to 43in. from mouthpiece to bell, whereas that of the bassoon, an instrument of the same pitch, is twice that length—is a puzzle to many. An explanation of the fact is to be found in the peculiar acoustic properties of the cylindrical tube played by means of a reed mouthpiece characterizing the clarinet family, which acts as a closed pipe, speaking an octave lower than

an open pipe of the same length, and overblowing a twelfth instead of an octave.

The origin of the bass clarinet must be sought in Germany, where Heinrich Grenser of Dresden, one of the most famous instrument-makers of his day, made the first bass clarinet in 1793, which was subsequently developed by Adolphe Sax and others into the instrument as we know it to-day.

The bass clarinet made its first appearance in opera in 1836 in Meyerbeer's *Huguenots*, act v., where in a fine passage the lower register of the instrument is displayed to advantage, and later in *Dinorah*. Two years later (1838), at the theatre of Modena, a bass clarinet, by P. Maino of Milan, differing in construction from the Sax model, was independently introduced into the orchestra. Wagner employed the bass clarinet in *Tristan und Isolde*, where, at the end of act ii, it is used with great effect to characterize the reproachful utterances of King Mark.

BASSEIN, a district and town in the Irrawaddy division of Lower Burma. The district has been reduced to 4,127sq.m., from 8,954sq.m. in 1871, having given up a large tract to the district of Myaungmya formed in 1896. The eastern half of the district lies in the Irrawaddy delta but the western half is formed by the southern portion of the Arakan Yomas and extends to the western or Arakan coast. The principal river is the Bassein, the westernmost distributary of the Irrawaddy. In 1921 the population of the district was 489,473, and of the town 42,563.

Bassein, the chief town and port, is the administrative centre of the district and division, and is situated on the eastern bank of the Bassein river. It fell before the British arms in May 1852, during the 2nd Burmese War, and now forms an important seat of the rice trade with several steam rice mills and has great capabilities from a mercantile point of view. Though there are several dangerous bends in the river, it is navigable up to Bassein by liners up to 10,000 tons. The vessels of the Irrawaddy Flotilla company ply between Rangoon and Bassein, etc., by inland waters, and a railway opened in 1903 runs north-eastward through the centre of the district to Henzada and Letpadan.

BASSELIN, OLIVIER (c. 1400–c. 1450), traditionally regarded as the author of a number of French drinking songs, was born in the Val-de-Vire in Normandy. He was by occupation a fuller. His drinking songs became famous under the name of Vaux-de-Vire, corrupted in modern times into "vaudeville." Basselin appears to have been killed in the English wars about the middle of the century, possibly at the battle of Formigny (1450). Early in the 17th century a collection of songs was published by a Norman lawyer, Jean le Houx, purporting to be the work of Olivier Basselin, but probably his own work.

It has been suggested that Basselin's name may be safely connected with some songs preserved in the *Bibliothèque Nationale* at Paris, and published at Caen in 1866 by M. Armand Gaste. The question is discussed in M. V. Patard's *La Vérité dans la question Olivier Basselin et Jean le Houx à propos du Vau-de-Vire* (1897). A. Gasté's edition (1875) of the *Vaux-de-Vire* was translated (1885) by J. P. Muirhead.

BASSERMANN, ERNST (1854–1917), German politician and leader of the National Liberal party, was born on June 26, 1854 at Wolsag in the Black Forest. He began his career in 1880 as a lawyer at Mannheim. From 1886 to 1892 he was deputy in the Baden Diet, and from 1893, with brief interruptions, a member of the *Reichstag*. In 1905 he became president of the National Liberal party. He died on July 17, 1917 at Mannheim.

BASSES-ALPES, a department of south-eastern France, formed in 1790 out of the northern portion of Provence. It is bounded on the north by the department of Hautes Alpes, east by Italy and Alpes Maritimes, south by Var and west by Vaucluse and Drôme. Area, about 2,698 sq.m.; pop. (1926) 88,347. It is a poor and hilly region, the highest summits (*e.g.*, the Aiguille de Chambeyron, 11,155 ft.) rising round the upper Ubaye in the extreme north. Only a small portion of the Durance valley, which crosses the west of the department, is under 1,000 ft. Its chief tributaries are the Ubaye, Bléone, Asse and Verdon. The system of folds west of the Durance has an east-to-west trend, and is older than the true Alpine ridges which run north-to-south until they reach the extreme south of the department towards Moustiers, where they bend sharply eastwards between the old crystalline

BY COURTESY OF MESSRS. BOOSEY AND CO. LTD., LONDON

THE BASS CLARINET, USED IN ORCHESTRATION SINCE THE YEAR 1838

massifs of Mercantour and Estérel. From near the head of the Ubaye valley, the Col de l'Argentière (6,545 ft.) gives access from Barcelonnette to Cuneo, in Italy. There are three arrondissements (Digne, Barcelonnette and Forcalquier), 30 cantons and 247 communes. The department forms the bishopric of Digne in the ecclesiastical province of Aix-en-Provence. Communications are severely limited by natural conditions; the main railway line from Grenoble to Avignon runs through the west of the department along the Durance from Sisteron to Manosque and has branch lines westwards to Forcalquier and eastwards to the valley of the Var through Digne. The mountain pastures have been much damaged by the Provençal shepherds to whom they are let out, while the forests have been greatly thinned, though extensive reafforestation is now being carried out. Population has seriously declined in recent years, but industries are reviving with the application of hydro-electric power to industry; and the tourist trade is an additional source of income to the local population.

BASSES-PYRÉNÉES, the extreme south-west department of France, bounded on the north by Landes and Gers, east by Hautes-Pyrénées, south by Spain and west by the sea. Area 2,977 sq.miles. Pop. (1926) 414,556 The Pyrenean crestline as elsewhere generally bounds Spain but there are important fortified passes, notably that of Somport and the historic one of Roncevaux (see RONCESVALLES) control of which was the strength of the mediaeval kingdom of Navarre. The peaks rise from Rhune (2,950ft.) eastward to Mourrons (9,760ft.). The whole of the Nive, Bidouze and the lower part of Gave de Pau, southern feeders of the Adour river, are in the department, with deep valleys among the mountains broadening out toward the north-west. The Adour below its junction with the large glacier-fed Gave de Pau is tidal and navigable and forms the boundary of the department. To the north of the complex rock systems of the Pyrenean axis the department is largely floored in the west by calcareous rock, but from the outlet of the great Gave de Pau from the mountains (at Lourdes, Hautes-Pyrénées), as well as from the similar outlet of the Adour farther east, a huge mass of mud and boulders has spread fanwise and is drained by radial streams. Beyond this fan is a sandy area.

The ancient Basque tongue still survives west of Oloron and Tardets with distribution determined by the passes of Roncevaux and the Bidassoa, and this region is also marked by its farmhouses with windows and frontage under the gable which has one side of the roof very long to cover the barn and stable, small because the animals can remain out. In Béarn on the other hand we have the courtyard-farm near the Gaves, and poorer cottages, transitional to the Basque type, on the hills. Mild rainy weather specially marks the Basque country, the rain continuing in spring. The climate promotes stock-raising, but maize, wheat, potatoes and flax are grown, also apples, pears, chestnuts and vegetables and some vines in the less moist east, in shelter near Pau. Woods are numerous. Besides determining the agricultural interests, the climate has created a tourist interest. Pau is a famous health resort and many visitors winter at S. Jean de Luz or Biarritz on the coast. There are also mineral springs at Eaux-Bonnes, Eaux-Chaudes, Cambo-les-Bains, S. Christau and Salies.

The department has three arrondissements, Pau (*q.v.*) with capital at Pau which is also the departmental capital; Bayonne (*q.v.*) with capital of that name, the diocesan centre and chief port; and Oloron (*q.v.*) with capital of same name. Biarritz, Orthez, Eaux Bonnes and S. Jean de Luz (*q.v.*) are other towns. St. Jean-Pied-de-Port (pop. 1,243), the historic fortress at the foot of the pass or "port" de Roncevaux, founded in the 11th century, was the capital of French Navarre until the Revolution. It is on the *Route des Pyrénées*. The department belongs to the educational region of Bordeaux and is part of the region of the XVIII. Army Corps.

Fisheries have some importance and Bayonne exports pit-props and timber products from the Landes, etc., and minerals such as salt from the hills, and it imports coal, fertilizers, etc. Le Boucau near Bayonne has chemical and metallurgical works whose output is increasing.

BASSET or BASSETTE, a French game of cards now obsolete, played by five persons with a pack of 52 cards. It resembles lansquenet (*q.v.*), in that it is played between a banker and several punters, the players winning or losing according as cards turned up match those already exposed or not.

BASSET HORN, a wood-wind instrument, which is not really a horn but a member of the clarinet family, of which it is the tenor. It consists of a nearly cylindrical tube of wood (generally cocus or box-wood), having a cylindrical bore and terminating

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

AN EARLY MODEL OF THE BASSET HORN

This instrument is not a horn but a member of the clarinet family. It derives its misleading name from a clarinet maker named Horn, its inventor

in a metal bell wider than that of the clarinet. The basset horn has the same fingering as the clarinet, and corresponds to the tenor of that instrument, being pitched a fifth below the clarinet in C.

Among the great masters, Mozart seems to have been particularly appreciative of this beautiful instrument which he employed in his *Requiem*, in the opera *La Clemenza di Tito*, in *Zauberflöte*, and elsewhere. Beethoven used it in his *Prometheus* overture and Richard Strauss employs it in *Die Frau ohne Schatten*.

The invention of the basset horn in 1770 is ascribed to a clarinet maker of Passau, named Horn—whence the instrument derived its misleading name.

BASSETT, JOHN SPENCER

(1867–1928), American historian, was born in Tarboro, N.C., on Sept. 10, 1867. He graduated at Trinity college, now Duke university, in 1888 and received the degree of doctor of philosophy at Johns Hopkins in 1894. In 1893 he began teaching history in Trinity college, continuing there until 1906. He then became professor of history in Smith college, and served in that chair until his death, which occurred in Washington, D.C., on Jan. 27, 1928. An active student of American history, he edited many historical documents including correspondence, and wrote numerous books on historical and biographical subjects. His earlier writings deal chiefly with the history of North Carolina. Among his works are *The Federalist System* (1905), *Life of Andrew Jackson* (1911), *The Plain Story of American History* (1915), *The Middle Group of American Historians* (1917), *The Lost Fruits of Waterloo* (1918), *Our War With Germany* (1919), *Expansion and Reform* (1926), *The Writing of History*, with J. J. Jusserand, W. C. Abbott and C. W. Colby (1926) and *The League of Nations* (1928).

BASSI, LAURA MARIA CATERINA (1711–1778), Italian scholar, was born at Bologna, married in 1738 Giuseppe Verrati, and left several children. She lectured on experimental philosophy at Bologna for many years, and corresponded with learned men in many countries.

BASSI, UGO (1800–1849), Italian patriot, was born in Cento, and received his early education at Bologna. An unhappy love affair induced him to become a novice in the Barnabite order when 18 years old. He entered on his ministry in 1833 and became famous as a preacher, his sermons attracting large crowds. In 1848, when Pope Pius IX. still appeared to be a Liberal and an Italian patriot, Bassi joined General Durando's papal force to protect the frontiers as army chaplain. After the pope's flight from Rome and the proclamation of the Roman republic, Bassi took part with Garibaldi's forces against the French troops sent to re-establish the temporal power. He exposed his life many times while tending the wounded under fire, and when Garibaldi was forced to leave Rome the faithful monk followed him. When the legion broke up, Bassi and a fellow-Garibaldian, Count Livraghi, after endless hardships were captured near Comacchio. On being brought before the papal governor, Bassi said: "I am guilty of no crime save that of being an Italian like yourself. I have risked my life for Italy, and your duty is to do good to those who have suffered for her." The governor gave them over

to an Austrian officer; they were falsely charged before a court-martial with having been found with arms in their hands, and shot on Aug. 8, 1849. Bassi is one of the most beautiful figures of the Italian revolution, a gentle unselfish soul, who, although unusually gifted and accomplished, had an almost childlike nature.

Countess Martinengo, *Italian Characters* (2nd ed., 1901); Zironi, *Vita del Padre Ugo Bassi* (Bologna, 1879).

BASSIANUS, JOANNES, Italian jurist of the 12th century, is said by Corolus de Tocco to have been a native of Cremona. He was a professor in the law school of Bologna, the pupil of Bulgarus (q.v.) and the master of Azo (q.v.). His best known extant treatise is the *Summary on the Authentica*, which Savigny regarded as one of the most precious works of the gloss-writers. Joannes, generally so termed, was remarkable for his talent in inventing ingenious forms to set forth his ideas, and perhaps his most celebrated work is his "Law-Tree," *Arbor Arborum*, the subject of many commentaries. It presents a tree upon the branches of which the various kinds of actions are arranged like fruit. The civil actions, or *actiones stricti juris*, 48 in number, are on one side, the equitable or *praetorian* actions, 121, on the other. A further division of actions was made by him under 12 heads, and by a system of notation the student could class at once each of the civil or praetorian actions under its proper head. His *Lectures on the Pandects* and the *Code*, collected by his pupil Nicolaus Furiosus, have perished.

BASSOMPIERRE, FRANÇOIS DE (1579-1646), marshal of France and the author of some famous *Mémoires*, was born at the Castle of Harrouel in Lorraine on April 12 1579. He was introduced at the court of Henry IV. in 1598, and became a great favourite with the king. He fought in the campaign in Savoy (1600) with the emperor against the Turks (1603), with Louis XIII. against the supporters of Marie de' Medici at Ponts-de-Cé (1620), and against the Huguenots at La Rochelle (1628), and in Languedoc (1629). In 1629 he was made a marshal of France, and fought his last campaigns in Savoy (1629) and in Piedmont (1630). In the intervals of fighting he was engaged on various diplomatic missions: to Madrid in 1621 over the difficult question of the Valtelline fortresses, and to England in 1626 to secure the retention of Henrietta Maria's Catholic attendants. The personal influence of Henry IV. had deterred Bassompierre from a marriage with Charlotte de Montmorency, daughter of the constable Montmorency, afterwards princesse de Condé, and between 1614 and 1630 he was secretly married to Louise Marguerite, widow of François, prince de Conti, and through her became implicated in the plot to overthrow Richelieu on the "Day of Dupes," 1630. His share was only a slight one, but his wife was an intimate friend of Marie de' Medici, and her hostility to the cardinal aroused his suspicions. By Richelieu's orders, Bassompierre was arrested at Senlis Feb. 25, 1631 and put into the Bastille, where he remained until Richelieu's death in 1643. After his release he passed most of his time at the castle of Tillières in Normandy, until his death on Oct. 12, 1646. He left a son, François de la Tour, by the princesse de Conti, and an illegitimate son, Louis de Bassompierre, afterwards bishop of Saintes. His *Mémoires* were first published at Cologne in 1665. He also left an incomplete account of his embassies to Spain, Switzerland and England (Cologne, 1668), and a number of discourses upon various subjects.

The best edition of the *Mémoires* is that issued by the *Société de l'Histoire de France* (1877); see also G. Tallemant des Reaux, *Historiettes de la princesse de Conti, et du Maréchal de Bassompierre* (1854-1860).

BASSOON, a wood-wind instrument with double reed mouth-piece, a member of the oboe (q.v.) family, of which it is the bass. The German and Italian names of the instrument (*Fagott* and *fagotto*) were bestowed from a fancied resemblance to a bundle of sticks, the bassoon being the first instrument of the kind to be doubled back upon itself; its direct ancestor, the bass pommer, 6ft. in length, was quite straight. The English and French names refer to the pitch of the instrument as the bass of the wood-wind.

The bassoon is composed of five pieces, which, when fitted together, form a wooden tube about 8ft. long (93in.) with a

conical bore tapering from a diameter of 1½in. at the bell, to ½in. at the reed. The tube is doubled back upon itself, the shorter joint extending to about two-thirds of the length of the longer, whereby the height of the instrument is reduced to about 4ft. The holes are brought into a convenient position for the fingers by the device of boring them obliquely through the thickness of the wood of which the instrument is made.

BY COURTESY OF CARL FISCHER INC.
THE BASSOON. LONG FAVOURED BY COMPOSERS BECAUSE OF ITS WIDE RANGE AND CHARACTERISTIC TONE COLOUR

The performer holds the instrument in a diagonal position; the lower part of the tube played by the right hand resting against his right thigh, and the little bell, turned upwards, pointing over his left shoulder; a strap round the neck affords additional support. The notes are produced by means of seven holes and 16, 17 or 19 keys. The mechanism and fingering are very intricate. Theoretically the whole construction of the bassoon is imperfect and arbitrary, important acoustic principles being disregarded, but these mechanical defects only enhance its value as an artistic musical instrument. The player is obliged to rely very much on his ear in order to obtain a correct intonation, and next to the strings no instrument gives greater scope to the artist. The bassoon has an eight foot tone, the compass extending from B flat below the bass stave to A flat (second space) in the treble or by means of an additional mechanism to C or even F.

The bassoon has been a favourite with nearly all the great masters. Beethoven uses it largely in his symphonies, writing everywhere for it independent parts of great originality. Bach, in his mass in B minor, has parts for two bassoons, and both Mozart and Weber wrote concertos for the instrument, which on account of its very characteristic quality of tone has often been employed for comic effects and has been called on this account the humorist of the orchestra.

BASSO-RILIEVO, the term applied to sculpture in which the design projects but slightly from the plane of the background. The relief may not project at all from the original surface of the material, as in the sunken reliefs of the Egyptians, and may be nearly flat, as in the Panathenaic procession of the Parthenon. In the early 19th century the term *basso-rilievo*, or "low relief," came to be employed loosely for all forms of relief, the term *mezzo-rilievo* having already dropped out of general use. (See SCULPTURE TECHNIQUE, *Modelling*.)

BASS ROCK, THE, a small island in the Firth of Forth, about 1½m. from Canty bay, Haddingtonshire, Scotland, circular in shape, a mile in circumference, and 350ft. high.

On three sides the cliffs are precipitous, but they shelve towards the south-west landing. The Bass Rock is an intrusive volcanic mass of phonolitic trachyte or orthophyre like the eruptive masses of North Berwick Law and Traprain Law, but non-porphyrific. Sea-birds, chiefly gannets or solan geese haunt the rock in vast numbers. A lighthouse with a six-flash lantern of 39,000 candle-power was opened in 1902. For a considerable distance east and west there runs through the rock a tunnel, about 15ft. high, accessible at low water. St. Baldred, whose name has been given to several of the cliffs on the shore of the mainland, occupied a hermitage on the Bass, where he died in 756. In the 14th century the island became the property of the Lauders, called afterwards the Lauders of the Bass, from whom it was purchased in 1671 by the Government, and a castle erected in which many Covenanters were imprisoned. At the Revolution four young Jacobites captured the Rock, and having been reinforced by a few others, held it for King James from June 1691 to April 1694, only surrendering when threatened by starvation. Thus the island was the last place in Great Britain to submit to William III. Dismantled in

1701, the Bass passed into the ownership of Sir Hew Dalrymple, to whose family it belongs.

BASSUS, AUFIDIUS, a Roman historian (d. probably A.D. 60). His work, which began with the civil wars or the death of Caesar, was continued by the elder Pliny. The *Bellum Germanicum* of Bassus may have been either a separate work or a section of his general history. Some fragments on the death of Cicero are preserved in the *Suasoriae* of the elder Seneca (vi. 23), but hardly justify Seneca's praise of him.

See Pliny, *Nat. hist.*, praefatio, 20; Tacitus, *Dialogus de Oratoribus*, 23; Quintilian, *Instit.* x. i. 103.

BASSUS, CAESIUS, a Roman lyric poet, who lived in the reign of Nero. He was the friend of Persius, who dedicated his sixth satire to him, and whose works he edited (Schol. on Persius, vi. i.). He is said to have lost his life in the eruption of Vesuvius (79). He had a great reputation as a poet (Quintilian, *Instit.*, x. i. 96). He is also identified with the author of a treatise *De Metris*, of which considerable fragments are extant (ed. Keil, 1885). The work was probably originally in verse, and afterwards epitomized in prose form. A worthless account of some of the metres of Horace (in Keil, *Grammatici Latini*, vi. 305), entitled *Ars Caesii Bassi de Metris* is not by him, but borrowed from his treatise.

BASSUS, CASSIANUS, called SCHOLASTICUS, one of the *geoponici* or writers on agriculture, lived at the end of the 6th or beginning of the 7th century A.D. He compiled a collection of agricultural literature (*Geoponica*) afterwards revised by an unknown hand, and published about 950, in the reign of Constantine Porphyrogenitus, to whom the work has been ascribed. It contains a list of the authorities drawn upon, and the subjects treated are agriculture, birds, bees, horses, cattle, sheep, dogs, etc.

BIBLIOGRAPHY.—Needham (1704), Niclas (1781), Beckh (1895); see also Gemoll in *Berliner Studien*, i. (1884); Oder in *Rheinisches Museum*, xlv. (1890), xlviii. (1893) and De Raynal in *Annuaire de l'Assoc. pour l'Encouragement des Études grecques*, viii. (1874).

BASSUS, SALEIUS, Roman epic poet, in the reign of Vespasian. He is praised by Quintilian (*Instit.* x. i. 90) and by one of the speakers in Tacitus' *Dialogus de Oratoribus* (5, 9). Vespasian relieved his poverty by a present of 500,000 sesterces. Nothing from his works has been preserved; the *Laus Pisonis*, which has been attributed to him, is probably by Titus Calpurnius Siculus (J. Held, *De Saleio Basso*, 1834).

BASSVILLE or BASSEVILLE, NICOLAS JEAN HUGON DE (1753–1793), French journalist and diplomatist, was born at Abbeville Feb. 7, 1753. At the outbreak of the Revolution he became editor of the *Mercurie internationale*. Then, through the Girondist minister Lebrun-Tondu, he entered the diplomatic service, went in May, 1792, as secretary of legation to Naples and was shortly afterwards sent, without official status, to Rome. His conduct in Rome, reflecting as it did his extreme revolutionary views, enraged the Roman populace; a riot broke out on Jan. 13, 1793, and Bassville, who was driving with his family to the Corso, was dragged from his carriage and so roughly handled that he died. The responsibility for the murder was laid by the Convention on the pope. In 1797 by an article of the treaty of Tolentino the papal government agreed to pay 300 million francs to the French government as compensation. The poet Vincenzo Monti, in his epic *Bassvilliani*, described the soul of Bassville looking down on the revolutionary scene as a penance before entering Paradise. Bassville wrote *Mémoires historiques, critiques et politiques sur la Révolution de France* (Paris 1790; English trans. London, 1790).

See F. Masson, *Les Diplomates de la Révolution* (1882); Silvagni, *La Corte e la Società romana nei secoli XVIII. e XIX.* (1881).

BASSWOOD (*Tilia americana* or *T. glabra*), a North American tree of the lime genus, called also linden, linn and whitewood, valuable for timber and planted for shade and ornament. It grows native from New Brunswick to Lake Winnipeg and southward to Virginia and Missouri, but is most abundant in the States adjoining the Great Lakes, Michigan and Wisconsin furnishing about half the basswood lumber produced in the United States. The similar white basswood (*T. heterophylla*), of the Appalachian region,

and the downy basswood (*T. pubescens*), of the southern States, are utilized also for lumber. In 1925 the total cut of basswood lumber in the United States amounted to 179,643,000 bd. feet. (See LIME or LINDEN.)

BAST, the common name for the outer part (phloem) of the vascular bundle of a plant. The term is also applied to piassaba fibre, etc.

BASTAR, the largest of the feudatory States of the Central Provinces of India. It has an area of 13,062 square miles and a population of 464,407, and is the southernmost tract of the Province. Its boundaries on the east and south-east are the Jeypore Zamindari of the Vizagatam agency in Madras, on the west and south-west the Chanda district and the Nizam's territory, and, on the north, the Kanker State which divides it from the Chhattisgarh plain. Only 7% of the whole area is under cultivation, the villages being divided by large tracts of forest. The inhabitants are almost entirely aboriginals, Halbas, Gond of various sections such as Marias, Murias and Parjas. The State has many potentialities in respect of timber, forest produce, and probably minerals. A large portion on the east is elevated plateau with a fairly temperate climate, and near the Eastern border is the capital, Jagdalpur (pop. 4,000). A good road connects this town with the railway at Dhamtari in the Raipur district. The forests contain both *sal* and teak according to the nature of the country and climatic conditions. The chief crops are rice and small millets, and there has been much shifting cultivation to the great damage of forest areas, but there are still about 5,000 square miles of good forest.

In the last 60 years there have been two rebellions against the Raja, the last in 1910, but except when excited by some unusual issue, the aboriginals are quiet and peaceful. They resent forest regulations because they regard the forests as God-given to themselves.

The largest river of the State is the Indrawati which entering the Eastern plateau from Jeypore crosses the whole of the State and becomes its western boundary for several miles before it joins the Godavari. There are famous falls at Chitrakat (94 feet high) where the river leaves the plateau, which, if they were not so remote, would give promise of a fine water-power scheme.

There are roads connecting the plateau with Sironcha in the Chanda district and towards Jeypore on the east. Proposals have frequently been made for opening up the State by light railway, but with so sparse a population as 36 to the square mile, and with so little cultivation, the traffic, with the possible exception of timber, would be very small for many years to come. The State is divided by a high range running north to south known as the *Bailadila* (bullock's hump), and west of this range the country falls away into the Godavari valley. It is a wonderful country for big game.

BASTARD, a person born out of legal wedlock. Amongst the Romans, bastards were classified as *nothi*, children born in concubinage, and *spurii*, those not so born. Both classes had a right of succession to their mother, and the *nothi* were entitled to support from their father, but had no rights of inheritance from him. Both, however, had in other respects most of the rights of citizenship. The Germanic law was based upon an entirely different principle. It recognized as legitimate only those whose parents were of the same social rank. All others were regarded as bastards, and took the status of the parent of inferior rank. The aim of all the Germanic codes was to preserve purity of race, not to improve morals, for incestuous unions are not censured. The influence of the Germanic law lasted throughout the early feudal period, and bastards were debarred rights of inheritance. In the 13th century the influence of Roman law tended again to modify this severity. An exception was probably made in the case of those whose fathers were of royal blood, in which case it even seems that no stigma was attached to the accident of their birth, nor did they suffer from the usual disabilities as to inheritance which attended those of illegitimate birth (Gregory of Tours, v. 25). Among the Franks we find Theodoric I., a natural son of Clovis, sharing the kingdom with the legitimate sons; Zwentibold, natural son of Arnulf, was created king of

Lorraine by his father in 895; and even William the Conqueror actually assumed the appellation of bastard.

In English law a bastard still retains certain disabilities. His rights are only such as he can acquire; for civilly he can inherit nothing, being looked upon as the son of nobody, and sometimes called *filius nullius*, sometimes *filius populi*. This, however, does not hold as to moral purposes, e.g., he cannot marry his mother or bastard sister. Yet he may gain a surname by reputation though he has none by inheritance. He has no right of succession to realty or personalty, and only legitimate descendants can succeed him on intestacy. Escheat being abolished by s. 45 of the Administration of Estates Act 1925, on intestacy the property would pass to the Crown as *bona vacantia* under s. 46.

For poor-law purposes, all legitimate children take the settlement of their father, but a bastard takes the settlement of its mother. The mother of an illegitimate child is entitled to its custody in preference to the father and under the Guardianship of the Infants Act 1925, it is the consent of the mother that is required for the marriage of such a child. Consequently the responsibility of its support falls primarily on her. But the English law has always recognized the principle that to a certain extent the father must share in that responsibility. This, however, was imposed not with the idea of furnishing the woman with a civil remedy, nor to have a penal effect against the man, but solely to prevent the cost of maintenance of the bastard child from falling upon the parish. Indeed, the legislation upon the subject, which dates back to 1576, was until 1845 an intimate part of the poor law. But by the Bastardy Act of 1845 the mother was given an independent civil remedy against the putative father, dissociating the parish altogether from the proceedings. Subsequently, legislation gave the parish the right of attaching, and in some cases suing for, money due from the putative father for the maintenance of the child. The existing law is set out under AFFILIATION. Originally a bastard was deemed incapable of holy orders, and disqualified by the fact of his birth from holding any dignity in the Church; but this doctrine is now obsolete, and in all other respects there is no distinction between a bastard and another man.

According to the common law, which is the law of England, a bastard cannot be divested of his state of illegitimacy, unless by the supreme power of an act of parliament. And this has been indirectly done by statutes of which the Colonial Marriages (Deceased Wife's Sister) Act 1906 and the Deceased Wife's Sister's Act 1907 are examples. Again marriages, celebrated in buildings not duly authorized, have been declared valid by act of parliament; thus any children would be made legitimate by statute. In 1926, however, by the Legitimacy Act of that year, legitimation by subsequent marriage was first recognized in England. The statutory legitimation is, however, limited both as regards persons and property. (See LEGITIMACY AND LEGITIMATION; and, for statistics, ILLEGITIMACY.)

United States.—The general rule in the United States is that legitimacy is presumed upon the establishment of the birth of a child in wedlock, but this presumption may be overcome by proof of the husband's impotency, or his absence during the entire and natural course of pregnancy and birth, or satisfactory proof of the non-existence of sexual intercourse although present. The weight of authority in the United States holds that the non-existence of actual intercourse, and not the opportunity for intercourse, controls in rebutting the presumption favouring legitimacy. In the United States the severity of the common law rule that the issue of an illegal or void marriage was illegitimate has been abated by statute in certain cases, such as where one having a former wife or husband living remarried in good faith, being in ignorance of the existing impediment to his or her lawful marriage with any one, the statute declaring that the court may decree the issue to be the legitimate issue of the party capable of contracting the marriage.

BASTARNAE, the easternmost people of the Germanic race who were the first to come into contact with the ancient world and the Slavs. Originally settled in Galicia and the Bukovina, they appeared on the lower Danube about 200 B.C., and were used by Philip V. of Macedon against his Thracian neigh-

bours. Defeated by these the Bastarnae returned north, leaving some of their number (hence called Peucini) settled on Peuce, an island in the Danube, and occupied the country between the eastern Carpathians and the Danube. As allies of Perseus and of Mithridates the Great, and lastly on their own account, they had hostile relations with the Romans who in the time of Augustus defeated them, and made a peace, which was disturbed by a series of incursions. In these, the Bastarnae after a time gave place to the Goths, with whom they seem to have amalgamated, and we last hear of them as transferred by the emperor Probus to the right bank of the Danube. Tacitus expressly declares their German origin, but says that the race was degraded by intermarriage with Sarmatians. No doubt they were an outpost of the Germans, and so had absorbed into themselves strong Getic, Celtic, and Sarmatian elements.

BASTI, a town and district of British India, in the Gorakhpur division of the United Provinces. The town, a collection of villages, is on the river Kuana, 40m. from Gorakhpur by railway. The population in 1921 was 17,691. The district, area 2,792 sq.m., is one vast level plain, draining towards the south-east, and traversed by the Rapti, Kuana, Banganga, Masdih, Jamwar, Ami and Katneihia rivers. The rich alluvial tract between these streams, more or less subject to inundations, produces good crops of rice, wheat and barley; and there are some fine *jhils*, attaining almost the size of inland lakes. In 1921 the population was 1,925,228. A large transit trade is conducted with Nepal. The district exports rice, sugar and other agricultural produce.

BASTIA, city, east coast of Corsica, 98m. N.N.E. of Ajaccio by rail. Pop. (1926), 33,747. It is the largest town on the island because it is near the mainland and it is the outlet for the fertile northern valleys. The centre, *Terra Vecchia*, is the original fishing village, while the *Terra Nuova* lies to the south, and the modern town to the north. The settlement was renamed *Bastia* when the Genoese fortress was built by Lionello Lomellino in 1383. Under the Genoese it was the principal stronghold in the north, and the residence of the governor; and in 1553 it was attacked by the French. On the division of the island in 1797 into the departments of Golo and Liamone, Bastia remained the capital of the former; but at the reunion Ajaccio became capital. The city was taken by the English in 1745 and again in 1794. The densely populated commercial quarter of the old port has steep and narrow streets, and the modern quarter to the north lies round the new port. Its churches, of which the largest is San Giovanni Battista, are florid in decoration, as are the law-court, the theatre and the *hôtel-de-ville*. The citadel, which dominates the old port, has a 14th-century keep. The chief exports are chestnut-extract for tanning, cedrates, citrons, oranges, early vegetables, fish, copper ore and antimony ore. Imports include coal, grain, flour and wine. Industry includes fishing (anchovies and coral), the manufacture of tobacco, oil-distilling, tanning, and the preparation of preserved citrons and of macaroni.

Bastia is the seat of a tribunal of first instance and of a sub-prefect, and of the military governor of Corsica, of a court of appeal and a court of assizes, and of a tribunal and a chamber of commerce.

BASTIAN, ADOLF (1826-1905), German ethnologist. Educated as a physician, he early devoted himself to travel. From 1861 he travelled in the Far East for five years. Upon his return he commenced the publication of his great work on *The Peoples of Eastern Asia*, an immense storehouse of facts owing little to arrangement or style. He was later made professor of ethnology at the university of Berlin and keeper of the ethnological museum. He was president of the Berlin Anthropological Society and part founder of the German Africa Society of Berlin.

Later he undertook further scientific travels in Africa, South America and India, and the results of these explorations were published in a long series of separate papers comprising several on Buddhism and on the psychological problems presented by native superstitions. Bastian also edited the *Zeitschrift für Ethnologie* from 1869, in conjunction with Virchow and Robert von Hartmann.

His more important works are: *Der Mensch in der Geschichte* (1860); *Die Völker des östlichen Asien* (Jena, 1866-71); *Ethnologische Forschungen* (1871-73); *Die Kulturländer des alten Amerika* (1878); *Der Buddhismus in seiner Psychologie* (1881); *Indonesien* (1884); *Der Fetisch an der Küste Guineas* (1885); *Die mikronesischen Kolonien* (1899-1900); *Die wechselnden Phasen im geschichtlichen Sehkreis und ihre Rückwirkung auf die Völkerkunde* (1900).

BASTIAT, FRÉDÉRIC (1801-1850), French economist, was born June 29, 1801, at Mugron, near Bayonne, where he led the life of a country gentleman, becoming a *juge de paix* of his canton in 1831, and in 1832 a member of the *conseil général* of the Landes. Becoming interested in the English Anti-Corn-Law League against protection, he contributed to the *Journal des Économistes* in 1844 a number of articles on the subject, including the first series of his brilliant *Sophismes Économiques* and in 1845 visited Paris to superintend the publication of his *Cobden et la Ligue*. In 1846 he assisted in organizing at Bordeaux the first French Association pour la Liberté des Échanges and was made secretary of a similar association formed in Paris, where he carried on a vigorous propaganda for Free Trade.

The agitation was brought to an abrupt end by the Revolution of Feb. 1848, which made the socialistic and communistic principles, which had been gathering and spreading during the previous 30 years, temporarily supreme.

Bastiat was returned by the Landes to the constituent assembly of 1849 and the legislative assembly of 1849, but rarely spoke. His real work was done with his pen. He wrote in rapid succession a series of brilliant and effective pamphlets and essays, showing how socialism was connected with protection. Within the space of two years there appeared *Propriété et Loi*, *Justice et Fraternité*, *Propriété et Spoliation*, *L'État*, *Baccalauréat et Socialisme*, *Protectionisme et Communisme*, *Capital et Rente*, *Maudit Argent*, *Spoliation et Loi*, *Gratuité du Crédit*, and *Ce qu'on voit et ce qu'on ne voit pas*. He was meditating the composition of a work on economics. The first volume of this work, *Les Harmonies économiques* was published in the beginning of 1850. In the autumn ill-health drove him to Italy, and he died at Rome on Christmas Eve, 1850.

Bastiat was unrivalled in his exposure of economic fallacies, for he had extraordinary wit and logical power. Professor Edgeworth says (Palgrave's *Dictionary of Political Economy*) that "the opinion that Bastiat did not make any considerable contribution to abstract theory is not inconsistent with gratitude to him for having popularized (in the best sense of the term) the discoveries of his predecessors."

The first volume of his *Oeuvres complètes* (1881) contains an interesting *Memoir* by M. Paillottet; see also *Lettres d'un Habitant des Landes* (ed. Cheuvreux, 1870).

BASTIDE, JULES (1800-1879), French publicist and Carbonaro, took part in the revolution of 1830, and throughout the reign of Louis Philippe conducted a Republican agitation in the Press. In 1847 he founded the *Revue nationale* with the collaboration of P. J. Buchez (q.v.), whose supporter he had become. He was foreign minister of the Republic for a few months in 1848.

BASTIDE [Provençal *bastida*, building], an old military word for the fortified towns founded in south-western France in the middle ages, and corresponding to the *villes neuves* of northern France. They were established by the abbey, the nobles and the crown, and were intended to serve as defensive posts for sparsely inhabited districts. They were built on a rectangular plan, with a large central square and with streets running at right angles or parallel to one another. A good example is the existing *bastide* of Monpazier (Dordogne) founded by the English in 1284. Mont-de-Marsan, the oldest of the *bastides*, was founded in 1141, and the movement for founding them lasted during the 12th, 13th and 14th centuries.

BIBLIOGRAPHY.—See E. Ménault, *Les Villes Neuves, leur origine et leur influence dans le mouvement communal* (Paris, 1868); Curie-Seimbres, *Essai sur les villes fondées dans le sud-ouest de la France sous le nom de bastides* (Toulouse, 1880).

BASTIEN-LEPAGE, JULES (1848-1884), French painter of portraits and rustic subjects, was born in Damvillers, Meuse, France, of good peasant stock on Nov. 1, 1848, and died in Paris

on Dec. 10, 1884. He went in 1867 to Paris to study under Cabanel, served in the campaign of 1870, and then returned to his Lorraine home, to paint in the open air. He was not the pioneer of the "plein air" school, but his brilliant work gave a great impetus to the movement. The fine portrait of his grandfather seated in the orchard of Damvillers, exhibited at the salon of 1874, made him famous. His "Annunciation to the Shepherds" (1878) failed to take the first place in the competition for the Prix de Rome, but one day a wreath of laurel was laid on it by Sarah Bernhardt. His small portrait of Sarah is one of the most famous of his pieces of characterization. The "Hayfield," now in the Luxembourg, exhibited in 1878, created a sensation as great as Millet's "Gleaners" had done. With it may be ranked his "Jeanne d'Arc" (Metropolitan Museum, New York), in which the Maid is represented as a true Lorraine peasant woman in the setting of a Lorraine farm. Among his more famous portraits are those of his friend and biographer A. Theuriet, and of Henry Irving (National Portrait Gallery, London). His studio in Paris was crowded with pupils, among them Marie Bashkirtseff. Between the young painter and the enthusiastic girl a great friendship sprang up. Both were stricken with disease, and both died in the autumn of 1884.

See A. Theuriet, *Bastien-Lepage* (1885; Eng. trans., 1892); Marie Bashkirtseff, *Journal intime* (1890); and Richard Muther, *The History of Modern Painting* (vol. iii.).

BASTILLE, originally any fortified building forming part of a system of defence or attack. The name, which is derived from the old French *bastir*, to build, was especially applied to several of the principal points in the ancient fortifications of Paris. In the reign of King John, or even earlier, the gate of Saint Antoine was flanked by two towers; and about 1369 Hugues Aubriot, at the command of Charles V, changed it into a regular bastille or fort by the addition of six others, the whole united by thick walls and surrounded by a ditch 25ft. wide. Extensions and alterations were afterwards effected; but the building remained substantially what it was made by the provost, a four-square gloomy structure, with eight towers. As the ancient forti-

CAPTURE OF THE BASTILLE BY THE REVOLUTIONISTS ON JULY 14, 1789
The above picture, reduced from a contemporary engraving, gives a highly idealized representation of the fall of the Bastille. The attacking forces were neither orderly nor for the most part uniformed.

fications of the city were superseded, the use of the word *bastille* as a general designation died out, and it became restricted to the castle of St. Antoine. The building had originally a military purpose, and it appears as a fortress on several occasions in French history. When Charles VII. retook Paris from the English in 1436, his opponents in the city took refuge in the Bastille, but the want of provisions obliged them to capitulate. In 1588 the duke of Guise took possession of it, and soon afterwards shut up the whole *parlement* within its walls, for having refused their adherence to the League. When Henry IV. became master of Paris he committed the command of the Bastille to Sully, and there he deposited his treasures. On Jan. 13, 1649, the Bastille

capitulated to the forces of the Fronde which, by the terms of the treaty made with the court in March, remained in possession of it till Oct. 21, 1651.

Very early, however, the Bastille was used for the custody of state prisoners, and it was ultimately more of a prison than a fortress. According to popular tradition the first who was incarcerated within its walls was the builder himself, Hugues Aubriot. It was not till the reign of Louis XIII. that it became recognized as a regular place of confinement; but from that time till its destruction it was frequently filled with men and women of every condition. Prisoners were detained without trial on *lettres de cachet* (q.v.)—often to satisfy personal animosities. But the most notorious use of the Bastille was to imprison those who criticized the government or persons in power. It was this which made it so hated and caused its capture by the revolutionary forces on July 14, 1789, to be regarded as symbolizing the downfall of despotism.

The treatment of prisoners in the Bastille varied greatly in different cases. The prisoners were divided into two main classes, those detained on grounds of precaution or by way of admonitory correction, and those who lay under presumption or proof of guilt. The former were subject to no investigation or judgment, and the length of their imprisonment depended on the will of the king; the latter were brought to trial in the ordinary courts or before special tribunals—though even in such cases as these it was possible for a man to grow old in the prison without being tried at all. Until convicted, the prisoner was registered in the king's name, and—except in the case of state prisoners of importance, who were often kept in absolute isolation—he enjoyed a certain degree of comfort and freedom. Visitors were admitted under restrictions; games were allowed, and, for a long time at least, exercise in open parts of the interior. Food was abundant and good, at least for the better class of prisoners. When the prisoner was convicted his name was transferred to the register of the "commission," and he became exposed to numerous hardships, and even barbarities, which, however, belonged not so much to the special organization of the Bastille as to the general system of criminal justice then in force.

Among the more distinguished personages who were confined in this fortress during the reigns of Louis XIV., XV. and XVI., were the famous *Man of the Iron Mask* (see IRON MASK), Fouquet, the marshal Richelieu, Voltaire, Lally-Tollendal and the Cardinal de Rohan. While the system of imprisonment by *lettres de cachet*—which were often given in blank to favoured courtiers and sometimes even sold by Ministers—cannot be too strongly condemned, it is unnecessary to believe all the tales of horror which found currency during the Revolution, and which historical evidence tends to modify, and even in many cases to refute altogether. Much light has been shed on the history of the Bastille from its own records. These documents were flung out into the courts of the building by the revolutionary captors, and after suffering grievous diminution and damage were stored up and forgotten in the vaults of the library of the (so-called) Arsenal. Here they were discovered in 1840 by François Ravaisson, who edited them for publication.

At the time of its capture only seven prisoners were found in the Bastille, which, soon after, was razed to the ground by order of the new municipality of Paris. The site of the building is now marked by a column of bronze, dedicated to the memory of the patriots of July 1789 and 1830.

See the *Memoirs* of Linguet (1783), and Latude (ed. by Thierry, tome iii. 18mo, 1791-93); Delort, *Histoire de la détention des philosophes à la Bastille* (1829); François Ravaisson, *Les Archives de la Bastille* (1866-86); G. Lecoq, *La Prise de la Bastille* (1881); F. Bournon, *La Bastille* (1893); Fr. Funck-Brentano, *Les Lettres de cachet à Paris, étude suivie d'une liste des prisonniers de la Bastille* (1904).

BASTINADO, the European name for a form of punishment common in the East, especially in Turkey (formerly), Persia and China. It consists in blows with a light stick or lath of bamboo upon the soles of the feet or on the buttocks (see FLOGGING).

BASTION, a projecting work forming a part of a line of fortifications (through the Fr. from late Lat. *bastire*, to build),

designed so as to bring flanking fire in front of the neighbouring bastions and along the curtain connecting them. In the following figure, A is the "salient" angle, AB and AC the "faces" of the bastion, BD and CE the "flanks." A "flat bastion" is one with a very obtuse salient angle. A "tower bastion" is a casemated tower built in bastion form. A "demi-bastion" is formed of half a bastion with a parapet from A-F.

BASIC PLAN OF A BASTION

The Bastion was an important feature of mediæval fortifications. An explanation of the diagram is given above.

His celebrity rests on his strong opposition to the Roman Catholic ceremonial. About 1633 he printed in Holland two Latin treatises, entitled *Elenchus Religionis Papisticae*, and *Flagellum Pontificis et Episcoporum Latialium*; and as Laud and other English prelates thought themselves aimed at, he was fined £1,000 in the court of high commission, excommunicated and prohibited from practising physic; his books were burnt and the author consigned to prison. His counterblast was *Apologeticus ad Praesules Anglicanos*, and another book called *The Litany*, in which he exclaimed vehemently against the proceedings of the court, and charged the bishops with being the enemies of God and "the tail of the beast." William Prynne and Henry Burton coming under the lash of the Star-Chamber court at the same time, they were all censured as turbulent and seditious persons, and condemned to pay a fine of £5,000 each, to be set in the pillory, to lose their ears, and to undergo imprisonment for life in remote parts of the kingdom, Bastwick being sent to Scilly. The parliament in 1640 reversed these proceedings, and ordered Bastwick a reparation of £5,000 out of the estates of the commissioners and lords who had sentenced him. He joined the parliamentary army, but in later years showed bitter opposition to the Independents. He died in the latter part of 1654.

BASUTO: see SOTHO.

BASUTOLAND or **LESUTO**, a district of South Africa, bounded by Natal, the Cape Province and the Orange Free State. It extends from 28° 35' N. to 30° 30' S. and from 27° E. to 29° 25' E. The area is estimated at about 11,700 square miles.

Structure and Topography.—The country consists of horizontal beds of the Stormberg, or highest, series of the Karroo system. These are divided again into Molteno beds, the Red beds, the Cave Sandstone and the Drakenberg Volcanics, the first mentioned being the oldest and therefore the lowest. The volcanic beds attain a maximum thickness of about 4,500 ft. Some of them are amygdaloidal and contain chalcedony and agates, which, when weathered out, often strew the surface of the ground, and were largely used by the Bushmen for making arrow-points, etc. The base of the lavas lies at about 6,500 ft., and may be regarded as a boundary line between two sharply contrasted parts of Basutoland. These beds form a higher, much dissected plateau, which attains its highest point in Mont aux Sources, over 11,000 ft. high, and which covers probably more than half the total area. This high plateau consists of long, grass-covered slopes, but it is limited on the east and west by very abrupt falls to the lower level of the sandstone and mudstone country below, that is, to Natal on the east, and to the lowland tract in the west. These two great escarpments are known as the Drakenberg and the Malutis. They do not form straight walls, but have been attacked by erosion, with the result that they consist of a series of mountain peaks (see **DRAKENBERG**), and great spurs and ridges, alternating with numerous deep and rugged valleys.

Where erosion has removed the volcanic beds the underlying sandstones and mudstones crop out, and give rise to an entirely different type of scenery. They are exposed in the main valleys of the high plateau—in the Siqu (or Orange) and the Siquanyane valleys—but their main outcrop coincides with a strip of com-

paratively low-lying country in the west, which ranges from about 5,000 to 6,500ft. above sea-level. The most prominent member of these geological formations is the Cave Sandstone, an ancient loess, which immediately underlies the lavas. It often caps tablelands, which are bounded by precipitous cliffs, and which vary greatly in size from the extensive Berea plateau, through isolated flat-topped hills, like Thaba Bosigo, the stronghold of Moshesh, to sharp, needle-shaped pinnacles. Whenever it outcrops on a hillside it forms craggy, precipitous slopes, which generally rule out the possibility of wheeled transport. Along the outcrops occur many caves and shelters which were used by the Bushmen and are still decorated with their paintings. Basutoland is also traversed by a large number of sills and dikes of dolerite.

From the upper plateau radiate a number of drainage systems. At Mont aux Sources rises the Tugela, which, after a short course of a mile or so, falls 5,000ft. out of Basutoland down into Natal, and subsequently finds its way to the Indian ocean. The Sinqu, or Orange, rises near the same place, as also does the Wilge. The latter flows northward to the Vaal river, while the former, with its tributaries, the Semena, the Sinquanyane and Caledon, drains practically the whole of Basutoland, and eventually empties itself into the Atlantic.

Climate.—Meteorological records have been insufficient to provide a basis for an accurate description of the Basutoland climate. The annual temperature is said to be about 60° F. In summer the heat is often tempered by the rain-bearing winds from the south-west. In winter cold may be severe, and natives sometimes perish in the mountains. The annual average rainfall is approximately 30 inches. About 70% falls during the five months, November to March, often in heavy thunder showers. The annual average number of rainy days is probably a little over 80; this increases to about 100 at Qacha's Nek on the Drakenberg escarpment, along which cloud, mists and cool drizzles are more frequent than elsewhere. Hailstorms are of frequent occurrence. In the mountains snow may fall even in summer.

Vegetation.—Formerly patches of bush or wood grew on the hillsides, and in the kloofs, but they have been practically all destroyed by the natives. With the exception of willows, which grow along the streams, timber is very scarce, and dried manure is the standard fuel. Basutoland is essentially a grassland area. In the spring and summer the pastures contain many beautiful flowers, and many species of heath grow in the mountains. Much damage has been done by overstocking, particularly with sheep and goats. Over large areas, especially in the Quthing district, the grasses have been replaced by useless weeds, or by bare slopes. Soil erosion is also a widespread evil. Considerable areas have been cut up into a maze of dongas, sometimes 30ft. deep. Such areas are of course entirely useless, and are serious obstacles to traffic of all kinds.

Fauna.—A few eland, hartebeest, smaller antelopes and hares manage to survive in the more secluded parts, but game is so harried by herd boys and others that it has become scarce. Partridge and quail may be shot in season and numbers of storks, like the swallows, migrate hither to escape the European winter.

Population.—The Bantu population increased from 347,731 in 1904 to 401,807 in 1911 and to 495,937 in 1921. The great majority consists of Basuto, a branch of the Bechuana family, but there are also several thousands of Barolong, a few Matabele, and, in the south, considerable numbers of Xosa peoples. In 1921 there were in Basutoland 1,603 Europeans, about a thousand coloured half-breeds and 172 Asiatics. The average density of population increased from 29.7 persons to the square mile in 1904 to 42.44 in 1921. The population, however, is not evenly distributed. Until recent years it was restricted almost entirely to the lowland strip in the west. The mountains had a population of herd boys only in summer. This distribution still holds good in the main, though, owing to pressure of population, and a shortage of land in the lowlands, permanent villages are being formed in the mountains.

Maseru is the chief centre of Basutoland. It is the administrative capital and had a population in 1921 of 399 Europeans, 1,890 natives and 30 coloured. In addition to the usual Government offices there are large stores, a hospital, a bank, a church

and two boarding houses. Other centres are at Leribe, Hlotse, Teyateyaneng, Mafeteng, Mohale's Hoek, Moyeni and Qacha's Nek.

Transport and Communications.—There is only one mile of railway, which links Maseru with the South African system. A good road, carried over the larger streams by bridges, runs from north to south in the western lowlands and connects all the Government stations, with the exception of Qacha's Nek, which can only be reached by wheeled traffic from East Griqualand. Other roads join the main stations with the nearest town or railway station in the Orange Free State. Wagon roads have been made to most of the trading stations in the lowland, and up the Orange river valley as far as Mount Morosi. In the volcanic uplands all transport is done by pack animals, or, to some extent, by means of human portage.

Land.—Land is the common property of the nation, held in trust by the chiefs, who apportion to each tribesman a certain amount of arable land, and a locality in the mountains for summer pasturage. There are no European farmers. The white population consists solely of Government officials, missionaries, traders and a few labour agents.

Agriculture.—There are no figures showing the actual production of the various crops. Large quantities of maize and Kafir corn (mabele) are grown in the western region. The early frosts in the mountains practically restrict their serious cultivation to below the 6,000ft. contour. In the mountains the chief crop is wheat, which thrives on the rich, black soil. Here it is sown in spring. In recent years its cultivation has been undertaken to a considerable extent in the lowlands, where it is sown in autumn. Wheat is only used for food in the remoter parts of the mountains. Wherever possible it is sold to the traders, or exchanged for maize or Kafir corn.

Stock.—According to the 1921 census the following animals were owned by the natives: cattle, 574,415; sheep, 1,854,426; goats, 894,257; horses, 152,325; mules and donkeys, 6,284. Seasonal migrations of stock form a prominent feature in the pastoral life. Cattle are taken to the mountains in spring and are brought back to the lowlands in autumn. The chief movements of the sheep and goats occur in connection with the shearing. The horses are mostly stunted and undergrown, owing largely to lack of proper feeding when young.

Trade.—There are 188 licensed traders in Basutoland. Their stores meet the native demand for blankets, clothing, saddlery, foodstuffs, cooking utensils, etc. Most of the native productions are sold to the traders, and are then exported. The chief exports in 1922 were wool, 12,829,330lb., mohair, 2,326,367lb., wheat, 128,204 bags, hides and skins, 210,247. The total value of exports was £699,330. Most of this trade passes through the Orange Free State, though a considerable quantity of wool is taken on pack animals down the Drakenberg passes into Natal and East Griqualand.

Government.—Authority is exercised by a resident commissioner, responsible to the High Commissioner for South Africa, and aided by seven assistant commissioners and other officers. For fiscal and administrative purposes the country is divided into seven districts—Maseru, Leribe, Berea, Mafeteng, Mohale's Hoek, Quthing and Qacha's Nek. Each of these is subdivided into wards, presided over by hereditary chiefs at the head of whom is the Paramount Chief. The chiefs adjudicate in cases affecting natives, according to native law, so far as it is not repugnant to European law. A native has, however, a right of appeal to the court of an assistant commissioner, or of the resident commissioner, where all cases involving a European are tried. A native council, with advisory powers, meets annually at Maseru, and discusses the domestic affairs of the nation. It is presided over by the resident commissioner, and consists of 95 members nominated by the chiefs and five nominated by the Government.

The total revenue for the year 1922-23 was £212,538, of which £121,234 was yielded by a tax of £1 per hut, and £62,011 by customs. Among the chief items of expenditure were police, £35,647; medical, £41,288 (including a sum for the leper settlement); education, £34,681; and public works, £28,517.

Police.—The Basutoland mounted police is commanded by the resident commissioner, and consists of four inspectors, ten sub-inspectors, two chief constables, four constables and 280 native non-commissioned officers and men. There are seven gaols in Basutoland.

Medical.—The medical service is directed by the principal medical officer, who resides in Maseru. In each district there is also a Government medical officer. There are five well equipped hospitals, staffed partly with trained European and partly with native nurses, and a few miles from Maseru is a large leper settlement.

Education.—In 1922 there were 495 native elementary schools in the area, with 34,733 pupils on their rolls. The average attendance was about 20,000. Most of these schools are conducted by the missionary bodies, but the Government makes a contribution to their cost. About a mile from Maseru is a Government industrial school, where native boys are trained in carpentry, wagon building, harness making, blacksmith's work and building. There are also a few schools for European children. At Morija is a press, belonging to the French Protestant Mission, which publishes books in Sesuto.

Religion.—Most of the Basuto are still heathen, though several missionary organizations are active. The most important denominations, from the point of view of numbers, are the French Protestant Church and the Paris Evangelical Mission, which, in 1921, claimed 66,883 native adherents. Next came the Church of Rome with 38,894, and the Anglican Church with 18,839. The total number of Christian Basuto is given as 135,749.

General.—Basutoland is one of the most prosperous and best administered native areas south of the Zambezi. The people, under British guidance, are making rapid progress in improving both their mental and material ways of life, and they co-operate willingly with the Government in its efforts to improve health, education, cattle breeding, agriculture, etc. They are intensely loyal to the Imperial connection.

See *Year Book of Union of South Africa; Annual Reports on Basutoland*, published by Colonial Office, London. (R. U. S.)

HISTORY

Until the beginning of the 19th century Basutoland appears to have been uninhabited save by wandering Bushmen, whose rude rock pictures are to be found in several parts of the Drakenberg. About 1800 the country was occupied by various tribes of Bechuana, such as Batau, Basuto, Baputi, who then possessed the greater part of what is now the Orange Free State province. They appear to have recognized the paramount authority of a family descended from a chief named Monaheng. By the wars of the Zulu chiefs Chaka, Matiwana, and Mosilikatze, these tribes were largely broken up, and it is recorded that one tribe, living in the Maluti mountains, was reduced to cannibalism. At this period a young man named Moshesh (born about 1700), who was of the family of Monaheng and already noted as hunter and warrior, gathered round him the remnants of several broken clans, out of which he welded the existing Basuto nation. He established himself in 1824 on the rock-fortress of Thaba Bosigo, where, in 1831, he successfully defended himself against Mosilikatze. In 1833 Moshesh invited the missionaries of the Société des Missions Evangéliques of Paris to settle in his country, and from that day until his death proved their firm friend. In 1836-37 large parties of emigrant Boers settled north of the Orange, and before long disputes arose between them and Moshesh, who claimed a great part of the land on which the white farmers had settled. The Basuto acquired an unenviable notoriety as a race of bold cattle lifters and raiders, and the emigrant Boers found them extremely troublesome neighbours. If the Basuto were eager for cattle, the Boers were eager for land; and their encroachments on the territories of the Basuto led to a proclamation in 1842 by Sir George Napier, the then governor of Cape Colony, forbidding further encroachments on Basutoland. In 1843 a treaty was signed with Moshesh creating Basutoland a native state under British protection.

Quarrels between Basuto and Boers continued: there were also

interminable disputes between the Basuto and other Bechuana tribes. After the proclamation of British sovereignty over the Orange river regions by Sir Harry Smith in 1848, Moshesh was unwillingly induced by Sir Harry to surrender his claims to part of the territory recognized as his by the Napier treaty. Disputes again arose and there was fighting in 1851 between the Basuto and a commando composed of British soldiers, farmers, and a native contingent, in which the Basuto were victorious. Both sides had just grievances and efforts to reach an accommodation were made. They failed, and in 1852 General Sir George Cathcart, who had succeeded Sir Harry Smith as governor of Cape Colony, led a small force against Moshesh. With that peculiar statecraft for which he was famous, Moshesh saw that he could not hope permanently to hold out against the British troops and followed up some successful skirmishes with General Cathcart by writing him a letter, in which he said: "As the object for which you have come is to have a compensation for Boers, I beg you will be satisfied with what you have taken. You have shown your power; you have chastised; I will try all I can to keep my people in order in the future." General Cathcart accepted the offer of Moshesh and peace was proclaimed, the Basuto power being unbroken. Fourteen months later (Feb. 1854) Great Britain renounced sovereignty over the farmers settled beyond the Orange, and Moshesh found himself face to face with the newly constituted Free State. The Boers and the Basuto proved, as hitherto, bad neighbours. During a war which broke out in 1865, Moshesh unavailingly appealed for British protection; the Boers proved victorious in the conflict, conquered a fertile strip of Basuto territory and forced Moshesh to sign a humiliating treaty at Thaba Bosigo. Moshesh again appealed for protection to the British, saying: "Let me and my people rest and live under the large folds of the flag of England before I am no more." On this occasion the British decided to take over Basutoland, and a proclamation of annexation was issued on March 12, 1868. Much against their wishes the Free State Boers were compelled to recognize the British annexation. The Treaty of Aliwal North, concluded (1869) between the Free State and the High Commissioner, defined the boundary between the Free State and Basutoland. By it the fertile strip of country west of the Caledon river, known as the Conquered Territory, was finally transferred to the Free State. The next year (1870) Moshesh died. For nearly 50 years he had led his people skilfully and well. He was one of the rare instances among the Bantu of a leader endowed with intellectual gifts which placed him on a level with highly endowed Europeans, and his life-work left a permanent mark on South African history.

In 1871 Basutoland was annexed to Cape Colony, which soon found that it had a hard task in dealing with the turbulent Basuto warriors. In 1879 Moirosi, a chief residing in the southern portion of Basutoland, openly repudiated colonial rule. An expedition was despatched from Cape Colony and severe fighting followed. Moirosi's stronghold was captured and the chief himself was killed. In 1880 the Cape Government felt sufficiently strong to extend to Basutoland the Cape Peace Preservation Act of 1878, which provided for the disarmament of natives. Its execution in Basutoland proved an extremely difficult task, and desultory warfare was carried on between the colonial troops and the Basuto until 1881. Peace was only restored through the intervention of the High Commissioner. In April 1883 a form of self-government was established, but was once more followed by internal strife among the chieftains.

The subjection of Basutoland to the control of the Cape Government had by this time proved unsatisfactory, both to the Basuto and to Cape Colony. The Cape Government therefore offered no opposition to the transfer of the country, and at a great national *pitso* (representative gathering) held in Nov. 1883 the Basuto agreed to the terms under which the Imperial Government was willing to take over the country. On March 13, 1884, the territory came therefore under the immediate authority of the Crown, that is, the Colonial office. The High Commissioner became governor of Basutoland, being represented in the territory by a Resident Commissioner. Native laws and customs were

interfered with as little as possible and the authority of the chiefs—all members of the Moshesh family—was maintained. Moshesh had been succeeded as paramount chief by his son, Letsie, and he in turn was succeeded in 1891 by Lerothodi (c. 1837–1905). Both these chiefs acted loyally with the Resident Commissioner, Lerothodi possessing many of the high qualities of Moshesh. The first commissioner was Sir Marshall Clarke, to whose tact and ability the country owed much. Sir Godfrey Lagden (commissioner 1893–1901) and Sir H. C. Sloley (commissioner 1901–17) also did much to help the Basuto and win their full confidence. The period of warfare over, the Basuto turned their attention more and more to agricultural pursuits and also showed themselves very receptive of missionary influence. Throughout the Anglo-Boer war (1899–1902) the Basuto remained passive, and the neutrality of the country was respected by both armies. One chief alone sought to take advantage of the situation by disloyal action, and his offence was met by a year's imprisonment. In pursuance of the policy of encouraging the self-governing powers of the Basuto, a national council (*pitso*) was officially instituted and held its first sitting in July 1903. In Aug. 1905 the paramount chief, Lerothodi, died. His son Letsie II. was elected by the *pitso* as Lerothodi's successor. On the death of Letsie II. in 1913, his brother Griffith became paramount chief. When the World War began Griffith and his people offered to raise regiments for combatant service. To their grief the offer was declined, for service with the labour contingents did not appeal to their martial spirit. However, 1,400 Basuto served with the S.A. Native Labour Contingent in France and many were employed in South-West and East Africa.

The Basuto gave repeated expression of their desire to remain under direct British control, as on the occasion of the visit of the prince of Wales to Maseru in 1925. Since 1910 their country has been an enclave, surrounded by territory forming part of the Union of South Africa. Basutoland offers the most complete example in South Africa of the segregation policy. Neither prospecting for minerals nor the settlement of white farmers is allowed. The few Europeans are officials, missionaries, or traders who have obtained permits. The country, in short, is a Basuto reserve, and the Basuto have a distinct degree of home rule. While the commissioner is not bound by the decisions of the national council, its advice is usually taken. The system has worked well, and while the people owe much to the missionaries, notably to members of the Paris Evangelical Society, and to the wise rule of sympathetic commissioners, they themselves, a virile race of mountaineers, possess qualities which are enabling them to build up a civilization combining African and European elements. Over a quarter of the Basuto profess Christianity.

Sayce, "Ethno-Geographical Essay on Basutoland," *Geog. Teacher* (1924), pp. 266–288. For current information see the annual report on Basutoland (Colonial Office, London). (F. R. C.)

BAT, a name for any member of the order Chiroptera (q v). Bats are usually insectivorous animals modified for flight. The patagium or "flying-membrane" of some squirrels and of *Galeopithecus* (q v.) probably indicates the way in which the front limbs were modified for flight. Bats are distributed throughout the world, but are most abundant in the tropics and the warmer parts of the temperate zones; the Malay "flying fox" (*Pteropus edulis*) measures about a foot in the head and body, and has a wing-spread of 5 ft., while in the smaller forms the head and body may be only about 2 in., and the wing-spread no more than a foot. The colour is generally sombre, but there are exceptions; the fruit-bats are brownish yellow or russet on the under surface; two South American species are white; Blainville's chin-leaved bat is bright orange.

In habits bats are social and nocturnal; the insect-eating species feed on the wing; in winter in the temperate regions they migrate to a warmer climate or hibernate. The sense-organs are highly developed. Most bats are insect-eaters, but the tropical "flying foxes" or fox-bats of the Old World live on fruit; some are blood-suckers, and two feed on small fish. Twelve species are British, among which the pipistrelle (*Pipistrellus pygmaeus*) is the commonest. See FLYING-FOX and VAMPIRE.

BATAC, a municipality (with administration centre and 35 barrios or districts) of the province of Ilocos Norte, Luzon, Philippine Islands, 12m. S. of Laoag the capital. Pop. (1918), 23,986, of whom 10,962 were males and four whites. Tobacco and rice are among the most important products, and there is a considerable trade in these and other commodities. Sugar, fans and woven fabrics are manufactured. In 1918 it had 32 household industry establishments, with output valued at 8,000 pesos; and 14 schools, all public. Batac was founded in 1587. It is the birthplace of Gregorio Aglipay (b. 1860), the founder of the schismatic Filipino Independent Church. The language is Ilocano.

BATAHIN: see ARABS.

BATAILLE, HENRI (1872–1922), French dramatist, was born April 4, 1872, at Nîmes. In early youth he thought of becoming a painter and, in 1890, entered the École des Beaux Arts. His first venture into dramatic work, *La belle au bois dormant* given at the Théâtre de l'Oeuvre in 1894, was a failure; but his reputation was definitely established by a book of verse *La chambre blanche* (1895), and when his Breton drama *La lépreuse* was produced in 1896, he stood revealed as a dramatist of real promise. From that time onwards he developed his gift for writing plays in which passion is shown to sway men's lives more than their beliefs, until he reached maturity with *Maman Colibri* (1904), *La marche nuptiale* (1905) and *Poliche* (1907). Among his other works are *La femme nue* (1908), *La vierge folle* (1910), *La divine tragédie*, a book of war poems (1916) and *La chair humaine* (1922). He died at Rueil, near Paris, on March 2 1922.

BATAK (not to be confused with the Batta [q v] or Battak of Sumatra), a tribe of apparently pre-Dravidian stock, with possibly a Negrito blend, inhabiting the interior of Palawan in the Philippines. They live by hunting, supplemented by meagre patches of occasional cultivation; one house is occupied by several families whose limits are defined by lines on the floor; government is by chiefs or old men. Breech-clouts and petticoats of bark cloth are the only garments, dancing the only diversion. Bamboo, shells and grasses are used as ornaments, the blowgun and the bow and arrow as weapons. Food is cooked by broiling in embers, cooking utensils being unknown.

See Miller, "Bataks of Palawan," *Ethnologic Survey of the Philippines*, ii., iii. (1905).

THE ROYAL CLOISTERS OF THE DOMINICAN MONASTERY AT BATALHA. The blending of Moorish and Gothic architecture has won for this building its universal fame.

BATALA, a town in British India, in the Gurdaspur district of the Punjab. Pop. (1921) 26,122. It is an important centre of trade, with manufactures of cotton and silk goods, shawls, brassware, soap and leather.

BATALHA (i.e., battle), a town of Portugal, 8m. south of Leiria. Pop. (1911), 4,082. Batalha is chiefly interesting for its great Dominican monastery of Santa Maria da Victoria ("St. Mary of the Victory"), also known as Batalha. In the battle fought on the plain between Canoeira and Aljubarrota, 9m. south-west, John I. of Portugal defeated John I. of Castile in 1385 and secured the independence of his kingdom. The monastery, probably founded 1388, is built of golden-brown limestone, resembling marble, and richly sculptured. It is roughly a parallelogram, about 500ft. from north to south, and 445 from east to west; with the circular annexe of the royal mausoleum on the east, and the Founder's chapel at the south-western corner; its southern division

is the Gothic church. The Founder's chapel contains the tomb of John I. (d. 1433) and Philippa of Lancaster (d. 1415), his queen, with the tomb of Prince Henry the Navigator (d. 1460). Like the royal mausoleum, where several later monarchs are buried, it has intricate and exquisitely finished carved stonework. Plans and masons were procured from England by Queen Philippa, and the work was entrusted to Affonso Domingues, a native architect, and Huet or Houguet, an Irishman. Only the royal cloister, church and Founder's chapel were included in the original design; and all three show signs of British influence. The Capellas Imperfeitas ("Unfinished Chapels") are one of the most marvellous examples of Manueline architecture. The earthquake of 1755 damaged the monastery and the French sacked it in 1810. It was secularized in 1834, declared a national monument in 1840, and thenceforward gradually restored.

BATANG (re-named **BAANFU** in 1908) is an important frontier-town in the Sino-Tibetan Borderland (30° 0' N. and 99° 30' E.). It is situated in a beautiful and fertile plain at a point on the Upper Yangtze where the great river which above Batang flows through a wide valley begins its tortuous and torrential descent through the wild mountain country of the Szechwanese alps. It is one of the chief depôts on the main trade-route between Chengtu in the Red Basin and Lhasa (*see* under **SZECHWAN**). Its inhabitants are mainly Tibetans. In 1908, when an important new Chinese administrative division known as Si-K'ang was constituted out of Western Szechwan and the adjacent part of Eastern Tibet, Batang was made its capital.

BATANGAS, a municipality (with administration centre and 49 barrios or districts), port of entry, and capital of the province of Batangas, Luzon, Philippine Islands, near the Batangas river, about 1 m. from its mouth on the east coast of the Gulf of Batangas, and about 65 m. S. by E. of Manila by land and 91 m. by sea. Pop. (1918), 41,089, of whom 19,889 were males and 20 whites. It is modern in appearance and is the most important port of Batangas Province which has long been noted for the fertility of its soil and the industry of its inhabitants. Its relative heavy exports include abacá (mainly to Japan), sugar, corn, horses, cattle and hogs. The coffee and cacao formerly raised in this region have almost disappeared, but an effort is being made to promote their growth. Excellent motor roads connect Batangas with Manila. In 1918 it had 13 manufacturing establishments with output valued at 138,600 pesos, besides 3,986 household industry establishments with output valued at 477,000 pesos. Of the 28 schools 26 were public. The language spoken in the District is Tagalog.

BATAVIA, a residency of Java, Dutch East Indies, under the Government of West Java, bounded east, south and west by the residencies of Krawang, Buitenzorg, and Bantam, and north by the Java sea. It also comprises small islands, including the Thousand Islands group (actually about 80), with a total area of 29,949 sq. km. Pop. (1925) 1,223,809; composed of 37,371 Europeans and half-castes, 1,084,057 natives and 102,381 foreign Asiatics, including Chinese. The natives are Sundanese with many Malays in the north. The northern half is flat, and even marshy along the coast, and consists of a broad band of alluvium. The southern half is a mountain range with peaks along the southern border, namely Halimon mountain, the volcanoes Salak, Pangerango and Gede, and the Megamendung. The soil is fertile; rice is grown on the lowlands, and coffee, tea, tobacco, cinchona and vanilla on the highlands. Extensive coconut and rubber plantations are found in the plains, and many market-gardens near the towns. Sugar was cultivated formerly. The government of the residency of Batavia differs from that of the other residencies in having no native regencies, the lands being privately owned. The divisions of the residency are Batavia, town and surroundings, Tangerang, Krawang, Meester Cornelis and Buitenzorg, the first being directly governed by a resident and the remainder by assistant residents. In the second half of the 17th century the Dutch East India Company began selling land to private persons, and granting land in reward for good services. Most of the southern or Buitenzorg division of the residency was appropriated by the governor-general in 1745 and attached to

that office. But in 1808, Marshal Daendels sold this section to various purchasers, including the Dutch Government, and thus the whole of the residency gradually passed into private hands. The principal towns are the sea-port, Batavia (*q.v.*), which is the capital of the residency as well as the seat of government of the whole Dutch East Indies; Meester Cornelis (pop. 64,329), the scene of a battle between a Dutch force under Marshal Daendels and a British force in Aug. 1811; Tangerang (pop. 11,061), and Buitenzorg (*q.v.*). The Buitenzorg hill-country is much visited on account of its beauty, and cool and healthy climate. Gadok is a health resort 6 m. S.E. of Buitenzorg. Batavia is traversed by two lines of railway, one eastwards to Cheribon and another southwards to Buitenzorg and on through the Preanger country to Bandoeng. It has also 183 m. of first class, 107 m. of second class and 50 m. of third class roads.

BATAVIA, a city and sea-port, on the north-east coast of Java, the capital of the Dutch East Indies. Population (1925), excluding Meester Cornelis, 290,408, composed of 28,753 Europeans and Eurasians, 216,247 natives, and 45,408 foreign Asiatics, including Chinese. The average mean temperature is 79° and average rainfall 72.31 with 136 rainy days. There are three divisions of the city: the port, Tanjong Priok, at the head of a capacious bay on the northern coast of the extreme western end of the island of Java; the old city of Batavia, a little distance inland, on level and swampy ground, on both sides of the river Jacatra, or Chiliwong; and the modern town of Weltevreden, yet further inland, directly south of Batavia, and merging into Meester Cornelis, to the south again. Even in the old town, the streets are mostly straight and regular, some quite broad, with the exception of the Chinese quarter, which, with its old quaintly-built houses and many canals, is like an Eastern Venice. Here are to be seen old buildings of the days when the Dutch built in the East as they built in Holland—very picturesque, with their brown-tiled roofs, diamond-paned windows, generally shuttered, and pleasing style of architecture, quite unsuited, however, to Eastern requirements. Much of this original city has disappeared, but fragments remain, and, though the fortifications exist no longer, near the old Town Hall (a fine building dating from 1710, now the Resident's Office) on an open square known as Kasteel Plein, is the ancient Penang Gate, with its two grotesque "Gog" and "Magog" figures, once part of the city walls. Other buildings include the grand old house of Governor-General van Riebeeck (1708), with entrance-hall of old tiles, depicting stories from the Bible; and the Portuguese Church (1693). The extraordinary old cannon, known as "Miriam Besar" (*mérim*, Malay for cannon), lies half-buried in the ground near the Penang Gate, and is held in great veneration by the native populace as an emblem of fertility. Old Batavia is inhabited to-day principally by Malays, Arabs, Chinese, Javanese, and some of the poorer Eurasians: it is the busy present in the day-time, the sleepy past at night. Its former shops are warehouses; the town-houses of the old merchants are mercantile offices. The shops, residences of Europeans, better-class Eurasians and Orientals, hotels, clubs, theatres, hospitals, government offices, banks, and the newer mercantile buildings and churches, are in Weltevreden, and in the streets, leading to Batavia, of which Molenvliet is the most important. In Weltevreden proper, are two large open spaces; one the Waterloo Plein, with its white column commemorating the battle of Waterloo; and the other Koningsplein, containing two sports clubs, a race-course, and Weltevreden station, on the line from Tanjong Priok. From these branch off the principal shopping and business thoroughfares, fine broad streets, such as Rijswijk, Noordwijk, Gunung Sahari, and Tanah Abang. In this quarter, too, are the principal government offices, the High Courts of Justice, the leading clubs, the large hotels, and restaurants, the Masonic Lodge, the theatre, and various public buildings and churches. The old Prins Hendrik Fort stands in pretty grounds nearly surrounded by water, between the Waterloo and Koningsplein. Near by, at the end of Willemsland, is the monument of General Michiels, killed in Bali in 1849. The newer parts of Weltevreden, south of Koningsplein extend to Meester Cornelis, and here, on both sides of the river, set in grass and trees, are hundreds of beautiful bungalows with wide,

tree-lined roads. At Meester Cornelis are the barracks and a military school.

The Batavian society of arts and sciences, now the "Royal Society," was founded in 1778. Eventually it was compelled to restrict its sphere to archaeology (a government department lends its aid), history, languages, and Archipelagian researches. In 1850, the "Royal Natural History Society" was founded. The former Society has a museum and the latter an excellent library. Their *Transactions* form a great contribution to the scientific and literary history of the Malay Archipelago. The Dutch Indies Astronomical Society, which founded the first observatory in the tropics, has an observatory in Weltevreden.

Educational facilities are afforded by medical schools for Europeans and natives, law schools, schools for training native officials, who later enter the civil service college, training schools for teachers, and a good high school, the Queen Wilhelmina and Prins-Hendrik School. There is also a Museum, and a Public Library. Several daily and weekly papers are published. An official tourist bureau is maintained at Weltevreden.

The so-styled "European" inhabitants, numbering 28,753, include people of mixed blood, i.e., native, or coloured, with European, and with full-blooded Japanese. The greater number of pure Europeans are Dutch. The Chinese form a very numerous and industrious section of the population.

Batavia has a very fine up-to-date port in Tanjong Priok. The original harbour (1877-83) has been much improved within recent years. The outer harbour is enclosed by two long stone Break-Waters running north and south, converging at the sea end, where the entrance is about 525ft. wide. The outer harbour channel, which has a depth of 30ft. at low water, leads to three inner harbours, of which the first is about 3,500ft. long and 600ft. wide, the second 3,300ft. long and 500ft. wide, and the third 3,300ft. long and 720ft. wide. The first inner harbour is suitable for ships drawing up to 27ft., the second for those of 30ft. draught, and the third has been designed for vessels drawing up to 40ft., whilst it is hoped that by dredging, the northern part of the second harbour will be made available for vessels of 40ft. draught. There are ample fully-equipped quays with warehouses belonging to the port authority, and to private companies. There are two dry docks, a coal storage wharf and a flying station. The port is connected with Batavia by a good road, a double rail track and canals (the Chiliwong is canalized), and lighters can sail thither along the chief shipping canal.

Batavia has good modern transport arrangements. It is connected by rail with every place of importance in Java. One line goes westwards to Bantam; two go eastwards, one along the north coast, and the other via Buitenzorg and Preanger, to Banjoemas, where they meet, and then with a branch to Semarang proceed to Surabaya and Banjuwangi, with branches to Pasuruan, Kediri, etc. Tanjong Priok has abundant communication by sea with all parts of the world and Batavia connects by telephone, cable, and wireless with the general world systems and all parts of the archipelago.

The exports from Batavia to the other islands of the Archipelago, to ports in India, the Malay Peninsula, Siam, Indo-China, China and Japan, are rice, sago, sugar, salt, coffee, Java cloths, teak, tobacco and arrack. It is also a clearing-house for the produce of the Archipelago—rubber, spices, vanilla, pepper, rattans, hides, coffee, palm-oil, copra, gum copal, damar, dye-woods, benzoin, camphor, beeswax, bird-skins, mother-of-pearl, tortoise-shell, trepang, edible bird-nests, plaited hats, sago, tapioca, cassava, ground-nuts, sisal, gambier, ebony, tin, copper ore, iodine, wolframite, manganese ore, sulphur, gold, silver, diamonds and petroleum, to which it adds its own special products—rice, tea, sugar, kapok, and quinine. The principal imports, which it distributes throughout the Archipelago, are textiles, iron and steel goods, rice, cigars and cigarettes, manures, cement, earthenware, paint, paper, yarns, haberdashery, and provisions from Europe; and opium, and various drugs, tea, cottons, silks, from India, China, Japan, and other Eastern countries, together with many kinds of foods and domestic articles for the large Chinese population of the Dutch East Indies. The total value of imports into Tanjong Priok in

1922 was 133,673,000 guilders, and exports, 120,120,000. The tonnage of vessels clearing the port in that year was 3,918,022 tons. The only local industries are the distillation of arrack (by Chinese), the burning of lime and bricks, and the making of pottery. The Java Bank, in the profit of which the government shares, is the principal bank, but there are at least ten other important banking concerns.

Batavia owes its origin to the Dutch Governor-General Pieter Both who, in 1610, established a factory at Jacatra on the ruins of Sunda Calappa; and to his successor, Jan Pietersz Coen, who founded the present city. In 1699, Batavia suffered from a severe earthquake. The rivers about it were choked with mud from the volcano Salak and flooded the surrounding country. As a consequence, Batavia became notorious for its unhealthiness and was in danger of being abandoned. In 22 years, from 1730 to 1752, 1,100,000 deaths are said to have been recorded: the death rate now fluctuates between 40% and 60% and amongst Europeans only 18%. Marshal Daendels (Governor 1808-1811), destroyed the ramparts of the old city, and began the nucleus of the new one at Weltevreden. In 1811 a British force was sent against the Dutch settlements in Java which had been incorporated by France, and to this force, after an engagement at Meester Cornelis, Batavia surrendered. It was restored to Holland by the treaty of 1814. (E. E. L.)

BATAVIA, a city in north-west New York, U.S.A., midway between Buffalo and Rochester, on Tonawanda creek, at an elevation of 900ft.; the county seat of Genesee county. It is served by the New York Central, the Erie and the Lehigh Valley railways. The area is 575q m., and the population in 1925 was 15,628.

Batavia is the trade centre of a prosperous farming and fruit-growing region. Hydro-electric power is available from Niagara, and there are important manufactures, especially of harvesting machinery, die castings and ploughs. The 31 factories within the city limits in 1925 had an output valued at \$9,322,744. The public school system is noted for a plan of tutorial instruction, supplementing class-room teaching, which was introduced in 1898 by the superintendent, John Kennedy (b. 1846). Batavia is the headquarters for Troop A of the State police. The State school for the blind (opened 1868) is here, and 13m. N.W. lies the Tonawanda Indian reservation of 7,548 acres.

There had long been an Indian town (Deo-on-go-wa) at this point, and two main trails crossed where the courthouse now stands. Batavia was laid out by Joseph Ellicott (1760-1826), agent and surveyor-general of the Holland Land Company, in 1801, while Holland was a part of the Batavian republic. He made it, rather than Buffalo, the capital of the "Holland purchase," saying "the Almighty will look out for Buffalo." From the beautiful stone "office" which he built in 1804, now preserved as an historical museum, issued the titles to most of the land in New York west of the Genesee river. Several fine old mansions are still standing, one of which is the present city hall. During the War of 1812, Batavia was a camp for soldiers and a haven for refugees and wounded from Buffalo and other frontier towns. The village was incorporated in 1823, and secured a city charter in 1914.

BATEMAN, HEZEKIAH LINTHICUM (1812-1875), American actor and manager, was born in Baltimore, Md., on Dec. 6, 1812. He was intended for an engineer, but in 1832 became an actor, playing with Ellen Tree (afterwards Mrs. Charles Kean) in juvenile leads. In 1855 he became manager of the St. Louis theatre and in 1859 moved to New York. In 1866 he was manager for his daughter Kate, and in 1871 went to London, where he took the Lyceum theatre. Here he engaged Henry Irving, presenting him first in *The Bells*, with great success. He died on March 22, 1875.

His wife, **SIDNEY FRANCES** (1823-1881), daughter of Joseph Cowell, an English actor who had settled in America, was an actress and the author of several popular plays, in one of which, *Self* (1857), she and her husband made a great success. After her husband's death Mrs. Bateman continued to manage the Lyceum till 1875. She later took the Sadler's Wells theatre, which she managed until her death on Jan. 13, 1881. She was the first to bring

to England an entire American company with an American play, Joaquin Miller's *The Danites*.

Mr. and Mrs. Bateman had eight children, three of the four daughters being specially educated for the stage. The two oldest, Kate Josephine (1842-1917), and Ellen, known as the "Bateman children," began their theatrical career at an early age. In 1862 Kate played in New York as Juliet and Lady Macbeth, and in 1863 had a great success in London as Leah in Mosenthal's *Deborah*. In 1866 she married George Crowe, but returned to the stage in 1868, playing later as Lady Macbeth with Henry Irving, and in various other rôles. After 1892 she conducted a school of acting. Her daughter, Sidney Crowe (b. 1871), also became an actress. Virginia (Mrs. Edward Compton) and Isabel, younger sisters of Kate Bateman, were also well known on the London stage.

BATEMENT LIGHTS, in architecture, the lights in the upper part of a perpendicular window, which are only half the width of those below.

BATES, EDWARD (1793-1869), American lawyer and statesman, was born in Belmont, Va., on Sept. 4, 1793, of a Quaker family. In 1814 he went to the Territory of Missouri of which his brother, Frederick, was secretary. There he began the practice of law and in 1816 became prosecuting attorney at St. Louis. He was a delegate to the State constitutional convention (1820), attorney-general of the State of Missouri (1820), member of the legislature (1822), States attorney for Missouri (1824) and representative in Congress (1826 Anti-Democrat). After one term in Congress he devoted most of his time to the law, but served in the legislature in 1830 and 1834, in the Chicago convention for internal improvement in 1847, in 1853 was appointed judge of the St. Louis land court and in 1856 led the Whig national convention at Baltimore. He became increasingly prominent as an anti-slavery advocate and in the Republican national convention of 1860 he received on the first ballot 48 votes for presidential candidate. He withdrew, however, in favour of Lincoln, who named him attorney-general in his first cabinet. In 1864 he resigned to resume the practice of law in St. Louis, where he died on March 25, 1869.

BATES, HARRY (1850-1890), British sculptor, was born at Stevenage, Herts, on April 26 1850. He began his career as a carver's assistant. In 1879 he came to London, studied first at the Lambeth School of Art and then at the Royal Academy schools, where in 1883 he won the gold medal and the travelling scholarship of £200 with his relief of "Socrates teaching the People in the Agora." Going to Paris he studied under Rodin. A head and three small bronze panels (the "Odyssey"), executed by Bates in Paris, were exhibited at the Royal Academy. His "Aeneas" (1885), "Homer" (1886), three "Psyche" panels, and "Rhodope" (1887) all showed marked advance in form and dignity, and in 1892, after the exhibition of his vigorously designed "Hounds in Leash," Bates was elected A.R.A. This and his "Pandora," in marble and ivory, which was bought in the same year for the Chantry Bequest, are in the Tate Gallery, London. Among his portrait busts are the equestrian statue of Lord Roberts (1896) in Calcutta and a statue of Queen Victoria in Dundee. But his masterpiece was an allegorical presentment of "Love and Life." Bates died in London on Jan. 30, 1899.

BATES, HENRY WALTER (1825-1892), English naturalist and explorer, was born in Leicester. In 1844 he met a congenial spirit in Alfred Russel Wallace, and in April 1848 the two friends sailed in a trader for Pará. They had little or no money, but

hoped to meet their expenses by the sale of duplicate specimens. After two years Bates and Wallace agreed to collect independently, Wallace taking the Rio Negro and the upper waters of the Orinoco, while Bates continued his route up the great river for 1,400m. He remained in the country 11 years, during which time he collected no fewer than 8,000 species of insects new to science. His long residence in the tropics with the privations which it entailed, undermined his health. Nor had the exile from home the compensation of freeing him from financial cares, which hung heavy on him till he had the good fortune to be appointed in 1864 assistant secretary of the Royal Geographical Society, a post which he retained till his death. Bates is best known as the author of one of the most delightful books of travel in the English language, *The Naturalist on the Amazons* (1863), the writing of which, as the correspondence between the two has shewn, was due to Charles Darwin's persistent urgency. "Bates," wrote Darwin to Sir Charles Lyell, "is second only to Humboldt in describing a tropical forest." His most memorable contribution to biological science was his paper on the "Insect Fauna of the Amazon Valley," read before the Linnaean Society in 1861, in which he clearly stated and solved the problem of "mimicry," or the superficial resemblances between totally different species and the likeness between an animal and its surroundings, whereby it evades its foes or conceals itself from its prey. A man of varied tastes, he devoted the larger part of his leisure to entomology, notably to the classification of coleoptera. Of these he left an extensive and unique collection, which, fortunately for science, was purchased intact by René Oberthur of Rennes.

BATES, JOHN, an English merchant who was tried before the court of Exchequer in Nov. 1606, for refusing to pay an extra duty of 5s. per cwt. on imported currants, levied by the sole authority of the Crown in addition to the 2s. 6d. granted by the Statute of Tonnage and Poundage, on the ground that such an imposition was illegal without the sanction of Parliament. The decision of the case in favour of the Crown threatened to establish a precedent which, in view of the rapidly increasing foreign trade, would have made the king independent of Parliament. The judgments of Chief Baron Fleming and Baron Clark, of considerable importance from the point of view of constitutional history, are preserved.

See *State Trials* (ed. 1779), xi. pp. 30-32; excerpts in G. W. Prothero, *Statutes and Constitutional Documents* (Clarendon Press, 1894); Gardiner, *History of England*, vol. ii.

BATES, JOSHUA (1788-1864), American financier, was born in Weymouth (Mass.) on Oct. 10, 1788. After several winters' schooling, he entered the counting-house of William Gray and Son in Boston, by whom a few years later he was sent to London in charge of their European business. There he formed a partnership with John, a son of Sir Thomas Baring. Two years later both partners were admitted to the firm of Baring Brothers and Co., of which Bates eventually became senior partner. In 1853-54 he acted as umpire of the international commission appointed to settle claims growing out of the War of 1812. In 1852-55 he contributed \$100,000 in books and cash for a public library in Boston. Upon his death, the main reference-room was named Bates Hall; and upon the opening of the new building in 1895, this name was transferred to its principal reading-room. During the Civil War he used his influence to prevent the raising of loans for the Confederacy. He died in London on Sept. 24, 1864.

See *Memorial of Joshua Bates* (Boston, 1865).

BATES, WILLIAM (1625-1699), English Nonconformist divine (one of the ejected ministers in 1662), was born in London. He was rector of St. Dunstan's, London, and was one of the commissioners at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions to the Book of Common Prayer. With other moderate churchmen he made efforts in 1668, and again in 1674, towards a comprehensive settlement, but the bishops were uncompromising.

Bates published *Select Lives of Illustrious and Pious Persons* in Latin; his other works, treating of practical theology, were printed after his death; again in 1723; and in 1815.

AFTER VIOLETT LE-DUC, "DICTIONNAIRE DE L'ARCHITECTURE FRANÇAISE"

BATESON, MARY (1865–1906), English historian, was born at Robin Hood's bay, Yorkshire, on Sept. 12, 1865, the daughter of W. H. Bateson, Master of St. John's college, Cambridge. Educated in Germany, at the Perse school for girls and at Newnham college, Cambridge, England, she became an associate of Newnham college and a member of the council. She lectured at Newnham, with intervals, all her life, and furthered the interests of the college in numerous ways. At her death on Nov. 30, 1906, she left her library and her property to Newnham.

Mary Bateson was a pioneer in the study of English mediaeval monastic history, and her first work was the publication of *The Register of Crabhouse Nunnery* (1889) for the Norfolk and Norwich Archaeological Society. She also carried out a considerable amount of research in the municipal history of Leicester and Cambridge. Perhaps her most important contribution to the study of municipal institutions was *Borough Customs*, edited by her with introductions for the Selden Society (2 vols., 1904–06). Her more popular works include *Mediaeval England* (1903) in the "History of the Nations" series, and the chapter on "France in America" (1608–1744) in the *Cambridge Modern History*. She was to have been one of the three editors of the *Cambridge Mediaeval History*, but died on Nov. 30, 1906, shortly after having accepted the appointment.

BATESON, BATSON or BETSON, THOMAS (1570–1630), important English madrigal composer. He was organist of Chester cathedral from about 1599 to 1608 and is believed to have been the first musical graduate of Trinity college, Dublin.

BATESON, WILLIAM (1861–1926), British biologist, was born at Whitby, Aug. 8 1861. He was educated at Rugby school and St. John's college, Cambridge, and became known for his biological investigations, which included important researches on Mendelism and the determination of sex. In 1894 he published *Materials for the Study of Variation*. In 1907 he gave the Silliman lectures at Yale university, from 1908 to 1909 was professor of biology at Cambridge, and in 1910 was appointed director of the John Innes Horticultural Institution at Merton Park, Surrey. From 1912 to 1914 he was Fullerian professor of physiology at the Royal Institution, and in 1914 was president of the British Association. He received the Darwin Medal of the Royal Society, of which he was a fellow and a royal medallist, in 1904, and was also the recipient of other British and foreign awards. His works include *Mendel's Principles of Heredity* (1902) and *Problems of Genetics* (1913), besides many short studies on biological subjects. He died at Merton, Surrey, on Feb. 8 1926.

BATESVILLE, a city of Arkansas, U.S.A., in the foot-hills of the Ozarks, 90m. N.N.E. of Little Rock, on the White river and the Missouri Pacific railroad; the county seat of Independence county. The population in 1920 was 4,299. Manganese is mined, and there are marble quarries in the vicinity. Water-power is available. The principal manufactures are flour, staves and excelsior. Arkansas college, a Presbyterian institution founded in 1872, is the oldest chartered college in the State.

BATH, THOMAS THYNNE, 1ST MARQUESS OF (1734–1796), English politician, was the elder son of Thomas Thynne, 2nd Viscount Weymouth. Born on Sept. 13 1734, Thomas Thynne succeeded his father as 3rd Viscount Weymouth in January 1751, and was lord-lieutenant of Ireland for a short time during 1765, although he never visited that country. He was appointed secretary of State for the northern department in January 1768; and was a prominent anti-Wilkite, being partially responsible for the "St. George's fields massacre." Before the close of 1768 he was transferred from the northern to the southern department, but he resigned in Dec. 1770. In Nov. 1775 Weymouth returned to his former office of secretary for the southern department, but resigned in 1779. In 1789 he was created marquess of Bath, and he died on Nov. 19 1796. Weymouth was a man of considerable ability especially as a speaker. Horace Walpole refers to his drunkenness, and in early life at least "his great fortune he had damaged by such profuse play, that his house was often full of bailiffs." He is said to have been a close friend and frequent companion of Charles James Fox.

See B. Botfield, *Stemmata Botevilliana* (1858).

BATH, WILLIAM PULTENEY, 1ST EARL OF (1684–1764), English politician, was a member of an old Leicestershire family, and was educated at Westminster School and at Christ Church, Oxford. He obtained, by patronage, a seat in Parliament for Hedon, Yorkshire, which he held continuously from 1705–34; from 1734–42 he sat for Middlesex. During the reign of Queen Anne he was a prominent Whig, and a friend of Robert Walpole. He was secretary for war from 1714–17 in the first ministry of George I., and followed Townshend and Walpole into retirement in the latter year. On Walpole's return to power in 1721 Pulteney found himself neglected, and had to accept the insignificant position of cofferer of the household. He began to oppose Walpole, and in consequence was dismissed from his sinecure in April 1725. From that day he became a violent opponent of Walpole, joining the group of malcontents known as the "patriots." With Bolingbroke he established the *Craftsman*, in the pages of which Walpole was incessantly denounced. For his "Proper reply to a late scurrilous libel" (in the *Craftsman* of 1731), he was challenged to a duel by Lord Hervey; for another, published in July 1731, he was struck off the roll of privy councillors and the commission of the peace. In the House of Commons he was one of the most effective opponents of Walpole. He denounced the appropriation of the sinking fund (1733) and the excise scheme of the same year in brilliant speeches, which had something to do with the withdrawal of the latter measure. On Walpole's defeat in Jan. 1742 Pulteney was entrusted with the formation of the new government, but he contented himself with a peerage and membership of the cabinet, of which Lord Wilmington was the head. Since he had been one of the principal opponents of Walpole's government, his action in declining responsibility cost him his reputation. He was raised to the peerage in 1742, and next year, on the death of Wilmington, asked the king for the post of first lord of the Treasury, only to find that it had been given to Henry Pelham. He was, indeed, for two days, in Feb. 1746, at the head of a ministry, but his political life was over. He died on July 7 1764.

BATH, city, municipal, and county and parliamentary borough of north-east Somersetshire, England, on the G.W.R., L.M.S., and Somerset and Dorset railways. Pop. (1921) 68,609; (estimated 1925) 69,050. It lies on the River Avon, 12 miles S.E. of Bristol, and has been called the most nobly placed and best-built city in all England. The crater-like situation of Bath, its sunward aspect, and the surrounding Cotswold hills combine to give it a character of its own. The open oolite hills were centres of population in prehistoric times, and the neighbouring Solsbury Hill bears evidence of pre-Roman occupation, but there is no evidence for the legendary foundation of the city by Bladud, 803 B.C. Solsbury commemorates the native deity, *Sul*, said to have been considered by the Romans the counterpart of Minerva. There are abundant evidences of full civic settlement in Romano-British times.

Roman Bath.—By the Romans, Bath was named *Aquae Sulis*, the name indicating the dedication to *Sul*. There were a temple of the goddess and a few houses for priests, officials and visitors, besides the large baths, and the place was apparently walled; but it did not contain a large resident population. Many relics have been disinterred, such as altars, inscriptions, fragments of stone carvings and figures and Samian ware. The chief buildings were apparently grouped near the later abbey churchyard, and included, besides two temples, a magnificent bath, discovered in 1755. Successive excavations have rendered accessible a remarkable series of remains, including several baths, a sudarium and conduits. The main bath still receives its water (now for the purpose of cooling) through the original conduit. The fragmentary colonnade surrounding this magnificent relic still supports the street and buildings beneath which it lies, the Roman foundations having been left untouched. The remains of the bath and of the temple are among the most striking Roman antiquities in Western Europe.

Bath (Achemann, Hat Bathum, Bothones, Batha) was a place of note in Saxon times, King Edgar being crowned there in 973. The present abbey church occupies the site of Saxon and Norman buildings, founded in connection with a 7th century convent, transferred in the 10th century to Benedictine monks. Bath was then a royal borough. The first charter, granted in 1180, conferred the same privileges as Winchester had. Others followed throughout the 13th, 14th and 15th centuries. The existence of a corporation being assumed in the earliest royal charter, and a common seal having been issued since 1249, there was no formal incorporation of Bath until the charter of 1590. Various fairs were centres of exchange when the cloth trade prospered; but the industry declined long ago. Bath "beaver," however, was known throughout England, and Chaucer makes his "Wife of Bath" excel the cloth-weavers of Ypres and of Gaunt. The golden age of Bath began in the 18th century, and is linked with the work of the two architects Wood (both named John), of Ralph Allen, their patron, and of Richard Nash, master of the ceremonies. Previously the baths had been ill-kept, the lodging poor, the streets beset by footpads. All this was changed by the architectural scheme, including Queen square, the Royal crescent and the North and South parades, which was chiefly designed by the elder Wood, and chiefly executed by his son. Nash provided the assembly rooms which figure largely in the pages of Fielding, Smollett, Burney, and their contemporaries. The genius of Wood, the re-discoverer and re-builder of Bath, and one of the pioneers of town-planning, fused the various traditions of the city, geographical, historical and social, into a grand architectural expression. His response to the *genius loci* is best illustrated in the Royal crescent.

Bath Abbey.—The Abbey church of St Peter and St. Paul is a singularly pure and ornate example of late Perpendicular work. From the number of its windows it has been called "The Lantern of the West," and especially noteworthy is the great west window. Slight traces of the previous Norman building remain. Of other churches of the city, that of St. Thomas of Canterbury is the oldest while St. Swithin's is one of the most interesting.

Among educational institutions may be mentioned the free grammar school, founded by Edward VI., the Wesleyan college originally established at Kingswood, Bristol, by John Wesley, and the Roman Catholic college. The hospital of St. John was founded in the 12th century. The public buildings include a guild hall, assembly rooms, Jubilee hall, art-gallery and library, museum, literary and scientific institute, and theatres. The mineral springs supply several distinct establishments. The temperature varies in the different springs from 117° to 120°F. The waters are very beneficial in cases of rheumatism, gout, neuralgia, sciatica, diseases of the liver, and cutaneous and scrofulous affections. One of the most noteworthy features is the successful treatment of children at the Bath Orthopaedic hospital. The Old Royal Bath, planned by John Wood, was restored for the specialized treatment of cripples and opened in 1927. The city has successfully retained its position and appearance as an aristocratic health resort and has added to its functions those of a tourist centre, the industries being concentrated outside in such suburbs as Twerton, which has quarries and brickworks. Building activity is restricted by natural causes; but residential suburbs are extending, e.g., at Bathampton to the north-east.

Markets still held on Wednesday and Saturday were granted originally in 1305. Fairs are now held on Feb. 4 and on the Monday after Dec. 9. Bath forms, with Wells, an episcopal see of the Church of England. The county borough of Bath (area 5,152ac.) returns one member to parliament. The city is governed by a mayor, 14 aldermen and 42 councillors.

BATH, a city of Maine, U.S.A., 30m. N.E. of Portland on the west bank of the Kennebec river, 12m. from the ocean; a port of entry and the county seat of Sagadahoc county. It is served by the Maine Central railroad and by steamers. The population in 1920 was 14,731. Shipbuilding, once the basic industry, reached its height during the World War, when the population increased 50% within a few years. Between 1907 and 1922 the Bath district launched 455 craft, including both naval and commercial types; but since the World War the industry

has dwindled to practically nothing. The manufacturing establishments within the city had an output valued at \$2,640,032. The city has a good harbour and a large domestic commerce, and there are many summer resorts near by. Bath was deeded to R. Gutch, of Salem, Mass., by an Indian sachem in 1660. It was incorporated as a separate town in 1781, as a city in 1847.

BATH, a village of New York, U.S.A., 40m. N.W. of Elmira and 6m. S. of Lake Keuka, at an altitude of 1,103ft.; on the Cohocton river and the Lackawanna and the Erie railways. It is the county seat of Steuben county. The population in 1927 was about 4,800. Its industrial plants make knitted underwear, bathing-suits and sweaters; sash, doors and ladders; harness and saddles; milking machines and brooms. There is a State fish hatchery. Bath is the seat of the Davenport home for orphan girls and of a State camp for veterans, formerly the State soldiers' and sailors' home, which at one time housed 3,000 veterans of the Civil War. The village, founded in 1793 by Capt. Charles Williamson and named after the English watering-place, was incorporated in 1816, and again in 1836.

BATHGATE, municipal and police burgh, Linlithgowshire, Scotland, 19m. W. by S. of Edinburgh by the L.N.E. railway. Pop. (1921) 8,504. Limestone, coal, ironstone, shale and fireclay are worked. Silver also was once mined and the old workings have been reopened in recent years. The manufactures include paraffin, paper, and whisky, and there are iron and steel works. The burgh is a considerable centre for agricultural produce; it formed the dowry of Marjory, Robert Bruce's daughter, who married Walter, hereditary steward of Scotland, in 1315.

BATHOLITH, in geology, a term applied to a large mass of intrusive igneous rock usually showing transgressive relations to the enclosing country rock (from Gr. *βαθός*, deep, and *λίθος*, a stone). The name was first used to describe those largest of all intrusions, characteristically developed in great mountain ranges, and thus includes those masses known as "central granites," "intrusive mountain cores," etc. Batholiths are distinguished from stocks only in size, the latter term being applied by many writers to irregular masses of batholithic habit with an area of outcrop not exceeding 100 square kilometres. Some of the best known batholiths reach thousands of square kilometres in area, such as those of Alaska, British Columbia and Patagonia. The discordant relations of these intrusions are shown by the rupture of the bedding or other structural planes of the enclosing wall rock. Great masses of the rocks invaded are often floated off and are found lying in the heart of the consolidated magma much transformed by the heat to which they have been exposed, and traversed themselves by the magma in ramifying threads. There can be little doubt that batholiths have developed during or closely following great orogenic movements; most are elongated parallel to the tectonic axis of the folded belts in which they are, and many show a primary gneissic banding clearly indicative of flow movement during the epoch of crystallization.

Two views are now prevalent as regards their mode of origin. According to the one, batholiths are conical masses rising from great depths and assimilating the strata which lie above and around them. This process is facilitated by the mechanical dislodgement or stoping of great masses of the enclosing rock which sink through the magma and are dissolved at depth. Thus interpreted, batholiths are active agents in making room for themselves by stoping and assimilation. Chemical no less than structural relations with the surrounding rocks preclude acceptance of this view: there is an entire absence of evidence for the existence of the excessive heat required for large scale assimilation processes, also the chemical homogeneity of those portions exposed to view is in itself a strong ground for its rejection.

The opponents of this theory hold that stoping or mechanical dislodgement is merely a subordinate factor in the emplacement of batholiths. Of late years much detailed study has been made of the granite batholiths of Silesia, the principal results of which we owe to Cloos and his co-workers. A field study of these intrusions (such as the massifs of Lausitz, Riesengebirge, Striegau and Strehlen) shows that they are injected *between* the country rocks and are therefore not bottomless. The magma coming from

a deep seated source has risen and spread in different directions, the amount and direction of horizontal spreading being largely determined by folds, faults or other lines of weakness in the surrounding rocks. Space is thus obtained by thrusting aside, lifting or even forcing down the adjacent rocks during the folding movements. Conclusions respecting the shape of batholiths have been obtained from numberless observations on the linear elongation of the component minerals (the "stretching"), disposition of the joints and their variable pitch and dip.

These features within any particular massif exhibit in general a dome-like arrangement, the underlying source of the magma being found beneath the crest of the dome. By these means the Hausenburger massif, for example, is shown to consist of an elongate arch with roots on the north-east side and a nearly level floor on the south-west; others are shown to possess a sill-like structure, the magma spreading laterally from a source situated along a line of weakness such as an overthrust. A considerable majority of batholiths are constituted of acid igneous rocks, generally of granitic, quartzdioritic or granodioritic composition. Large batholiths of basic composition are rare. Of such, those built up of anorthosite, e.g., in eastern Canada and New York State, are best known.

See H. Cloos, "Das Batholithen problem" (*Fortschritte der Geologie und Palaeontologie*) (Berlin, 1923). (C. E. T.)

BÁTHORY, SIGISMUND (ZSIGMOND) (1572-1613), prince of Transylvania, was the son of Christopher, prince of Transylvania, and Elizabeth Bocskay, and nephew of the great Stephen Báthory. He was elected prince in his father's lifetime, but being quite young at his father's death (1581), the government was entrusted to a regency. In 1588 he joined the league of Christian princes against the Turk, a policy which roused violent opposition which he surmounted in 1595 by executing his opponents. In 1595 he subdued Walachia defeating Sinan Pasha at Giurgevo (Oct. 28). The turning-point of his career was his separation from his wife, the archduchess Christina of Austria, in 1599, an event followed by his own abdication the same year, so that he might take orders. He offered the throne of Transylvania to the emperor Rudolph II., in exchange for the duchy of Oppeln. In 1600, however, at the head of an army of Poles and Cossacks, he attempted to recover his throne, but was routed by Michael, voivode of Moldavia, at Suceava. In Feb. 1601 the diet of Klausenburg reinstated him, but again he was driven out by Michael, never to return. He died at Prague in 1613. Báthory's indisputable genius must have been warped by a strain of madness. His incalculableness, his savage cruelty (like most of the princes of his house he was a fanatical Catholic and persecutor) and his perpetual restlessness point plainly enough to a disordered mind.

See Ignaz Acsády, *History of the Hungarian State* (Hung.), vol. ii. (Budapest, 1904).

BATHOS, properly depth, the bottom or lowest part of anything. The current usage for a descent "from the sublime to the ridiculous" is due to Pope's satire "Bathos" (*Miscellanies*, 1727-28), "the art of sinking in poetry." The title was a travesty of Longinus' essay, *On the Sublime*.

BATHS. The word bath is used: (1) for the process of immersing the body in some medium other than atmospheric air, for the purpose of cleanliness or as a cure; and (2) for the building or room in which such immersion takes place.

Separate structures for baths existed at a very early date, and probably similar types are still to be found among primitive peoples. Although bathrooms occurred in early Egyptian palaces, remains are too fragmentary to permit complete analysis of Egyptian types. It is the palaces of the Aegean civilization that provide the earliest well preserved examples of bathrooms. They are remarkable both for careful structure and for an advanced system of water supply and drainage. Examples are in the palaces of Cnossus and Phaistos, c. 1700-1400 B.C., and also on the mainland as in the palace of Tiryns, c. 1200 B.C. Bathing occupied an important place in the life of the Greeks; vase paintings show that there were showers; but even though in the later period there were public baths, they never received important and monumental architectural treatment. Eastern peoples

seem to have had luxurious baths which Alexander the Great is reported to have admired.

Roman Baths.—The Romans with their customary organizing genius and love of luxury developed to a degree before unknown not only the technique of bathing but also the planning of bath buildings. Their bathing process seems to have been as follows: The bather undressed and left his clothes in the *apodyterium*. He then was anointed with oil in the *aliptherium* or *unctuarium*

FROM SMITH, "DICTIONARY OF GREEK AND ROMAN ANTIQUITIES"

ROMAN BATHS AFTER A DRAWING FOUND IN THE BATHS OF TITUS

and, thus anointed, went to the room or court where he could indulge in violent exercise. After this he proceeded to the *calidarium* or hot room and the *sudatorium* or *laconicum*, a steam room. It was probably at this point that the body was scraped of its accumulation of oil and perspiration with curved metal *strigiles*. The bather then went to the warm room, or *tepidarium* and then into the cold bath or *frigidarium*, in which there was frequently a swimming pool. This completed the process. There is some question as to the exact order in which the hot and cold baths were taken and of the exact relationship of *calidarium* and *laconicum*, which were apparently often combined in one room.

To carry on this complicated process the Romans developed baths varying in size from those in the larger houses, in which each unit was merely a tiny room, to the enormous *thermae* of Imperial Rome. The essential features that run through all types are: (1) An adequate system of furnishing hot, tepid and cold water; (2) The heating of the hot portions of the bath and sometimes also the *tepidarium* by the circulation of the smoke and heated air from a fire under the floor and through the hollow walls. (3) In the hot bath adequate basins for warm and cold water.

A good example of the private bath exists in the so-called villa of Diomed in Pompeii (see Mau, *Pompeii*). Pompeii also furnishes the two oldest Roman public baths extant, the Stabean baths and those of the Forum, both of which have two com-

MEN'S BATHS AT POMPEII, SHOWING, FROM LEFT, FRIGIDARIUM, TEPIDARIUM AND CALIDARIUM. 1. FLUES, 2-4. WATER VESSELS

plete sets of bathrooms, one for men and one for women. These are of a type characteristic of all the smaller baths, ruins of which have been found in many provincial towns such as Trier, Germany, and Timgad and Leptis Magna, Africa. The general scheme consists of a range of barrel vaulted apartments flanking an open court. The rooms are of approximately the same size and are usually three in number: the *apodyterium*, usually surrounded by niches to serve as lockers; the *tepidarium*; and the *calidarium*, which has an apse at one end containing the *lābrum* and at the other end the hot bath or *alveus*. The cold bath in both the larger Pompeian establishments takes the form of a small circular room with a large round pool in the centre.

THE BATHS AT SERDJILLA (9) SHOW A SYRIAN MODIFICATION OF ROMAN PRECEDENT, AND SUCH MODIFICATIONS LED EVENTUALLY TO THE DEVELOPED ORIENTAL TYPE AS IN KASHAN, PERSIA (6), OR BRUSA, TURKEY (5 & 8). THE LUXURIOUS RICHNESS OF THE ROMAN BATHS, AS SHOWN AT POMPEII (2) AND IN THE BATHS OF CARACALLA AT ROME (10), IS MATCHED BY THE MONUMENTAL CHARACTER OF SOME MODERN PUBLIC BATHS, SUCH AS AT MUNICH (14); BY SWIMMING POOLS LIKE THAT OF THE SHELTON HOTEL, NEW YORK (4); BY SHORE BATHING ESTABLISHMENTS LIKE THAT AT RYE (1).

The recently (1928) excavated baths of Leptis Magna have as their main feature a large swimming pool, lavishly cased in marble and bordered by a monumental colonnade.

It was only in Rome, however, in the great imperial *thermae* that the bath received its most complete architectural form. Here the problem was complicated by the development of the baths as great social centres in addition to their primary purpose. Gardens, a stadium and *exedrae*, where lectures were given and poems read, all became necessary parts. The fully developed examples are those of Titus (A.D. 81), Domitian (A.D. 95), Trajan (c. A.D. 100), Caracalla (A.D. 217) and Diocletian (A.D. 302). Extensive remains of the baths of Titus, Caracalla and Diocletian exist.

The general scheme comprised a great open garden surrounded by subsidiary club rooms, and a block of bath chambers either in the centre of the garden, as in the baths of Caracalla, or at its rear, as in the baths of Titus. The main block contained, in addition to the *frigidarium*, *calidarium* and *tepidarium*, courts and smaller bath-rooms. Of the three great bath-rooms in this block, the *tepidarium* was made much the most important and was used, apparently, as the great assembly-hall or lounge. The *frigidarium* appears frequently to have been an enormous unroofed swimming bath, and the *calidarium*, on the other side of the *tepidarium*, is, in the baths of Diocletian and Caracalla, treated as a domed, circular hall. Service was furnished by means of underground passage ways; slaves could move swiftly and simply without being seen. In order to light and roof the enormous rooms, the Romans were forced to develop an ingenious system of buttressing, cross vaulting and clerestory windows. Their scheme of groined vaults carried on interior columns and buttressed by cross buttresses, which form the walls of recesses opening from the room, has since been an inspiration to designers of great halls (e.g., St. George's Hall, Liverpool; Pennsylvania Station, New York). The remains of the baths of Diocletian, whose *tepidarium*, slightly altered by Michelangelo, now forms the church of S Maria Degli Angeli, gives an extraordinarily vivid impression of what the *thermae* must have been. The important pieces of sculpture, found in Roman baths, such as the Laocöon group from the baths of Caracalla, indicate the richness of their furnishings. Floors were universally of marble or mosaic. Walls were apparently sheathed with marble to a considerable height, and decorated above with stucco reliefs, colour and mosaic. Gilt bronze was used freely for doors, capitals and window screens.

It is significant that in the great imperial *thermae* there is only one set of public rooms. The usage varied. At times women and men were admitted to the baths at different hours and at times mixed and promiscuous bathing was permitted. Outside of Rome the separation of the sexes into two different sets of rooms in the same establishment was more common. There are many contemporary references to Roman baths and bathing scattered through the works of Pliny the Younger, Seneca, Juvenal, Suetonius and, in the later empire, Ausonius and Statius.

Mediaeval Baths.—The excesses apparently common under the system of mixed bathing in the public baths were bound to produce a reaction and the church fathers generally agreed that bathing should be confined to the purposes of cleanliness and health. Moreover, the destruction of the great aqueducts (see *AQUEDUCT*) of Rome led to the closing of the baths. The habit, however, of the bath as a luxury, and of public buildings for it, must have continued alive in Europe, for by the 12th century we find indications that public baths were common, and in the 14th and 15th centuries they again became notorious. Late Gothic tapestries and woodcuts indicate that the existence not only of much out door bathing in garden pools but also of bath houses

STRIGILS OR SCRAPERS
USED ANCIENTLY AFTER
BATHING

with large pools or basins of warmed water. In both cases the bathing was quite promiscuous; the abuse of this custom is indicated by the colloquial use of the Italian word *bagnio* (bath) for a brothel. During the Renaissance there was little additional development of bathing, and the mechanical arrangements were of the crudest, as in the famous bath of Marie Antoinette at Versailles.

Mohammedan Baths.—Bath architecture, however, progressed in the countries under Mohammedan rule. There, either through the development of a primitive eastern bath tradition, or through the adoption of the Roman system, or, as is perhaps more likely, through a merging of the two, the complicated technique of bathing continued and with it the growth of adequate architectural forms. The Alhambra, at Granada, has a beautiful set of bath-rooms, all rectangular, which show the Moorish form at the beginning of the 14th century. Further east Roman or Byzantine forms were the basis of the baths. Constantinople baths, which are typical, and whose form seems to have varied little in five centuries, consist universally of a series of square rooms, carrying domes on pendentives. Each series of rooms is composed of a warm, hot and steam room, corresponding roughly to the *tepidarium*, *calidarium* and *laconicum*. The place of the *frigidarium* is generally taken by a basin of cold water at one end of the warm room. In addition to these vaulted chambers there are dressing rooms and frequently a luxurious rest room.

Russian Baths.—In Russia, a great love of hot and steam baths has produced a multitude of bath houses. These are usually simple and consist only of a steam room and a cold bath; frequently even the cold bath is lacking and the bather plunges directly from the steam room into a river, or outdoor pool, or even snow.

Modern Baths.—Contemporaneous with the Industrial Revolution a new feeling for personal cleanliness led quickly to the erection of public bath houses to compensate for the universal lack of home plumbing. Three main types have arisen. The mid-19th century baths consisted of a range of small individual bath-rooms and a control office; with the development of athleticism shower baths and swimming pools were added, the original form, without a pool, is less common (1928) than formerly because

SECTION OF BATH DISCOVERED AT
TUSCULUM, SHOWING ARRANGE-
MENT OF CALIDARIUM 1—ALVEUS,
2—LABRUM

of the growing custom of having at least one bath-room in each residence. The second type, approximating the Roman, is a large and complex structure containing a swimming bath with adjacent ranges of showers, through which bathers are compelled to pass before entering the pool, steam, massage and rest rooms, and occasionally restaurants. The third type was developed in connection with medicinal springs and is designed to include all units that might add attractiveness; such establishments contain all necessary bath and treatment rooms

and also restaurants, card rooms, concert and dance halls and extensive gardens. Modern western architecture has developed no distinctive forms for either Turkish or Russian baths both of which have been very popular since the beginning of the 19th century. The European municipal swimming baths are, in many cases, works of great architectural interest. On the continent there are usually first and second class establishments under the same roof. The swimming pools are frequently large and often vaulted, and their resemblance to Roman prototypes is strong. Noteworthy among these are the Guentz bath at Dresden, the municipal bath at Hanover and the enormous and monumental Karl Mueller public baths at Munich. The imperial baths and the Bacz baths at Budapest are especially lavish in their appointments, and show, in their use of domed rooms, strong Turkish influence. Medicinal baths exist in all countries; among the best known are those of Baden Baden and Karlsbad in Germany; Vichy and Aix-les-Bains

in France; Bath and Harrowgate in England; White Sulphur Springs, W. Va., and Hot Springs, Ark., in the United States.

The modern bath-room contains a tile tub and a shower that is often enclosed in glass; its walls and floors are embellished with tiles and mirrors; it is planned for cleanliness and convenience, and in large houses is often lavishly decorated as well. The design of swimming pools has become a science. By means of disinfectants, the same water can safely be used again and again, making a swimming pool possible even when the water supply is limited. Hotels, clubs and steamships maintain pools. The tank is usually of reinforced concrete lined with glazed or ceramic tile and furnished at the water level with a gutter that automatically removes floating scum. Outdoor swimming pools are also built. Another form of the modern bathing establishment is that found at seaside resorts, where the necessary cubicles, showers, suit and towel laundries, and storage space may be combined with terraces, restaurants and club house facilities; the beach clubs of the Florida, U.S.A., winter resorts represent the highest development of this type.

Far Eastern Baths.—Although bathing has always been popular in both China and Japan, it has reached its highest development in the latter. There every house has a bath which usually consists of a circular wooden tub of considerable size. This tub is placed outdoors in the court or garden and all the members of one family are usually served by one filling of exceedingly hot water. In the more luxurious houses and native hotels the system is largely the same, although the tub may be indoors, and the bather is, in these, given a thorough massage at the same time. The Japanese have also built numerous bath establishments of great size near medicinal springs; a famous example is that near Matsuyama, on the island of Shikoku. In these, the bath proper consists of a large, shallow pool with steps on which the bather sits. Surrounding the pool are cubicles for dressing. The main bath-room is fre-

quently of two storeys with tea-rooms, restaurants, etc., above. In all Japanese baths, public and private, there is no attempt to achieve privacy. Public baths, for instance, will frequently have large, unprotected openings through which people in the streets can watch the bathers.

The medium of the baths hitherto described has been water, vapour or hot dry air. Other substances used are sand, peat, radio-active mud, aromatic herbs in great variety, especially pine oil, scented and coloured soluble salts, ammonia. Electrical baths (see ELECTROTHERAPY), sun baths (see HELIOTHERAPY and UL-

BATHURST, EARLS. ALLEN BATHURST, 1st Earl Bathurst (1684-1775), was the eldest son of Sir Benjamin Bathurst (d. 1704), by his wife, Frances (d. 1727), daughter of Sir Allen Apsley of Apsley, Sussex, and belonged to a family which is said to have settled in Sussex before the Norman Conquest. He was educated at Trinity college, Oxford, and became member of parliament for Cirencester in May 1705. In 1711, he was created Baron Bathurst of Battlesden, Bedfordshire. He defended Atterbury, bishop of Rochester, and in the House of Lords was an opponent of Sir Robert Walpole. After Walpole left office in 1742 he was made a privy councillor, and in Aug. 1772 was created Earl Bathurst, having previously received a pension of £2,000 a year chargeable upon the Irish revenues. He died on Sept. 16 1775. Pope, Swift, Prior, Sterne and Congreve were among his friends. The letters which passed between him and Pope are published in Pope's *Works*, vol. viii. (London, 1872).

HENRY, 2nd Earl Bathurst (1714-1794), was the eldest surviving son of the 1st earl. Educated at Balliol college, Oxford, he was called to the bar, and became a K.C. in 1745. From 1735 to 1754 he sat in parliament for Cirencester; in the latter year he became a judge of the court of common pleas and in 1771 lord high chancellor, when he was raised to the peerage as Baron Apsley.

Having become Earl Bathurst by his father's death in Sept. 1775, he resigned his office somewhat unwillingly in July 1778 to enable Thurlow to join the cabinet of Lord North. In Nov. 1779, he was appointed lord president of the council, and left office with North in March 1782. He died at Oakley Grove

near Cirencester on Aug. 6 1794. Bathurst was a weak lord chancellor, but appears to have been just and fair in his distribution of patronage.

HENRY, 3RD EARL BATHURST (1762–1834), the elder son of the second earl, was born on May 22, 1762. He was member of parliament for Cirencester from 1783 until he succeeded to the earldom in Aug. 1794. Owing mainly to his friendship with William Pitt, he was a lord of the admiralty (1783–89), a lord of the treasury (1789–91), and commissioner of the board of control (1793–1802). Returning to office with Pitt in May 1804 he became master of the mint, and was president of the board of trade and master of the mint during the ministries of the duke of Portland and Spencer Perceval, only vacating these posts in June 1812 to become secretary for war and the colonies under the earl of Liverpool. For two months during the year 1809 he was in charge of the foreign office. He was secretary for war and the colonies until Liverpool resigned in April 1827 and deserves some credit for improving the conduct of the Peninsular War. Bathurst's official position brings his name frequently into the history of the abolition of slavery. He was lord president of the council in the government of the duke of Wellington from 1828 to 1830, and favoured the removal of the disabilities of Roman Catholics, but was a sturdy opponent of the Reform Bill of 1832. He died on July 27 1834. Bathurst was made a knight of the Garter in 1817, and held several lucrative sinecures.

BATHURST, a city of Bathurst county, New South Wales, Australia. Pop. (1926) 9,380. It is situated on the south bank of the Macquarie river, at an elevation of 2,153 ft., in a fertile undulating plain on the west side of the Blue Mountains. Bathurst is the centre of the chief wheat-growing district of New South Wales, while gold, copper and silver are extensively mined in its vicinity. There are railway works, coach factories, tanneries, breweries, flour-mills and manufactures of boots and shoes. The town was founded in 1815 by Governor Macquarie, taking its name from the 3rd Earl Bathurst, then secretary of state for the colonies, and it has been a municipality since 1862.

BATHVILLITE, a naturally occurring organic substance. It is an amorphous, opaque, and very friable material of fawn-brown colour, filling cavities in the torbanite or Boghead coal of Bathville, Scotland. It has a specific gravity of 1.01, and is insoluble in benzene.

BATHYBIUS, a slimy substance, at one time supposed to exist in great masses in the depths of the ocean, and to consist of undifferentiated protoplasm. Regarding it as an organism which represented the simplest form of life, Huxley, about 1868, named it *Bathybius Haeckelii*. But investigations carried out by the "Challenger" expedition indicated that it was a flocculent precipitate of gypsum thrown down from sea-water by alcohol, and the hypothesis of its organic character was abandoned by most biologists. Huxley included.

BATHYCLES, an Ionian sculptor of Magnesia, was commissioned by the Spartans to make a marble throne for the statue of Apollo at Amyclae, about 550 B.C. Pausanias (iii. 18) gives a detailed description of this monument, which is of the greatest value to us, showing the character of Ionic art at the time. It was adorned with scenes from mythology in relief and supporting figures in the round.

For a reconstruction, see Furtwängler, *Meisterwerke der griech. Plastik*, p. 706.

BATIK, a Javanese word meaning wax painting—the application of a wax "resist" to various materials which are afterwards dyed, and certain portions of which are protected by the wax so that they do not absorb the dye, leaving as a result a pattern or design on them. The resist is usually composed of bees-wax, paraffin and sometimes a little resin, which makes it adhere more securely to the material. This resist is applied hot so that it flows easily and sinks into the material, protecting from the dye that part which it covers.

History and Uses in Java.—Little is known of the origin of this art; it is, like many others, lost in antiquity. Some believe that it originated in China, while others claim that it is a natural outgrowth of the methods employed for centuries in India.

Probably the latter is more nearly correct. There have been found ruins of temples in Java about 1,200 years old, among which were fragments of stone figures wearing garments similar to those worn to-day by the natives and decorated with similar patterns, and it is likely that these same designs have been handed down for centuries. Batik is used almost entirely throughout Indonesia for

FIG. 1.—NATIVE JAVANESE DANCERS, DRESSED IN COSTUMES OF BATIK, PERFORMING AN ANCIENT DANCE

the decoration of the very simple clothing which the people wear. This clothing consists, in the main, of only four pieces:—

(1) The *Sarong*, a strip of cloth from 9 to 14 ft. long by about 3½ ft. wide, which is worn twisted about the body in various ways. (See fig. 4)

(2) The *Slendang*, a piece of cloth about 9 ft. long and only 18 in. wide, which may be twisted about the head or used by the women for carrying their babies or other burdens on their backs.

(3) The *Kemban*, a narrow girdle or band, worn only on occasion by the women, twisted tightly about their waists or breasts.

(4) The *Sarong Kapala*, a square piece of material not unlike a large bandanna handkerchief, worn by the men, twisted about their heads like a turban in some particular way which designates the locality from which the wearer comes and his station in life. After this piece has been arranged on the head it is removed and starched on the inside so that it will hold its shape.

Each of these pieces is decorated with a design and in colours which indicate the part of the country from which it comes. The

FIGS. 2, 3.—JAVANESE WOMEN IN DRESS COSTUME OF BATIK

designs and colours are all similar, but, on the other hand, they have very definite variations. In all parts of the country, however, there are in use two types of sarong; the usual type, decorated with an all-over pattern, and the dress type, worn on ceremonial occasions. The latter is enhanced by the addition of a wide band, across one end, more ornately decorative than the body of the piece, and also by a surrounding border made up of a number of various-sized smaller borders of different widths, making a beautiful frame similar to that seen on oriental rugs. In all of the

sections the designs are based upon the same origin and consist of conventionalized objects of nature, such as flowers, butterflies, birds, fruits, foliage, cuttlefish and shells and occasionally of a conventionalized Malay kris or knife. These designs are passed from generation to generation and taught by each mother to her daughter, for it is the women who draw them while the men do the dyeing. (See fig. 12.)

Javanese Practice.—In Java batik is done, as a rule, upon cotton cloth or sometimes silk. Whatever the material, it is first carefully prepared by several washings in hot water, alternating with steepings in coconut oil or castor oil (fig. 6). These washings are done in water containing an alkali, such as a weak solution of soda or the ashes of burnt rice stalks, and after each washing, before it is steeped in the oil, it is dried in the sun until it finally assumes the soft creamy tone so beautiful in the finer pieces. After the washing process it is hemmed and then starched or sized in a solution of rice water, again dried in the sun and then rolled up into a loose roll, placed on a board and gently pounded with a hammer or rolled with a wooden roller until it becomes soft and pliable, when it is ready to be suspended upon a frame. Sometimes the artists block in the designs with charcoal (see fig. 10), but many of them are so sure in their art that they are capable of drawing the intricately involved patterns without this aid.

Instruments.—The *tjanting* is the instrument used for applying the wax. It is a small copper cup, from the bottom of one side of which curves outward and downward a delicate spout or

FIG. 4.—NATIVE WOMAN SHOWING METHOD OF TWISTING SARONG ABOUT THE BODY

FIG. 5.—NATIVE IMPLEMENTS USED IN MAKING BATIKS

The wax is melted on the charcoal stove and applied to the lines of the design with various types of *tjantings*, which will be noted as having different kinds of spouts. The larger areas are covered by the use of *djegoel*, two types of which are shown

capillary tube, and from the opposite side of which projects a bamboo handle, cut in such a way that a spur follows the lower line of the cup. These *tjantings* are of various forms: some have large spouts and some very slender ones; some, called *penembok*, have wide flat spouts, while others may have as many as two, three, four or even six, all springing from the same cup, so that it is possible to draw with them, simultaneously, a number of parallel lines. Besides the *tjanting*, there is a primitive instrument called

the *djegoel*, which is simply a stick of wood with a wad of cotton attached to the end, forming a sort of crude brush which is used for filling in the large areas with wax. (See fig. 5.)

Native Practice.—Seated on the ground, the material hanging over a frame before her (fig. 11), the artist covers that part of the design which is to remain the natural colour of the material with a wax consisting of about six parts animal fat to one part resin and to which is sometimes added one part of pure bees-wax and a little of the old wax which, owing to carbonization and former contact with the indigo dye, has become dark, making the whole resist more easily seen upon the fabric. When this first step is finished the piece must be turned over and carefully waxed on the back so that there is no possibility of the dye entering the fabric from that side. It is then immersed in cold water, which thoroughly hardens and solidifies the wax, so that it is ready to enter the dye which has been prepared for it. When it has been satisfactorily dyed, the wax is removed and the piece re-waxed, leaving exposed other parts which are to be dyed a different colour.

In sharp contrast to the East Indian, and even more so to modern European methods, stands this "Javanese practice" of carefully waxing the back of the fabric and of removing the wax and replacing it in a different section of the design each time a new colour is to be dyed. In Europe and America the custom is to dye one colour over another, removing the wax only when this becomes impossible. It is, as has been said, the native custom to confine themselves almost entirely to cotton and silk, while in the West batik is also done upon woollens, velvets, ivory, straw or any other material which can be stained with dye. Sometimes batik is employed upon metal or wood, the exposed surface of which is etched away with acid, giving the effect of low relief carving.

FIGS. 7, 8.—LAYING OUT CLOTH FOR SUN-BLEACHING AND POUNDING THE CLOTH TO SOFTEN IT

one with which beautiful results have been obtained. There is little doubt that the method originated in Madras, where it has at any rate been used extensively since the 15th century.

A *tjap* is a wooden block which has had set into the end of the grain small copper strips, similar to the *cloissons* which divide the different enamel colours in the well known *cloisonné* of China and Japan. These strips are carefully bent with tiny pliers until they

FIG. 6.—WASHING THE CLOTH AS A PRELIMINARY TO BLEACHING AND DRYING IT IN THE SUN

The dyes used by the natives were originally, without doubt, vegetable, but nowadays they are making use of some of the anilines brought to them from Holland. Indigo provides blue, and the other colours, such as red from madder and yellow from the bark of mangosteen, are typical. Secondary colours are produced, at times, by dyeing one of these colours over another, and black is produced by the dyeing of brown over the indigo-blue; the range of colours, however, is not very great, and the native is far more interested in the intricacy of the design than in the delicacy of colour.

Tjap Printing.—Although this is not true batik and is looked down upon by the natives themselves, it is a similar process, and

assume the desired curves and are then fastened into the wood block. For the application of the wax, the tjaps are made in pairs, one for each side of the material. They are simple to use, for the process consists of dipping the block into the molten wax (which, in this case, must be somewhat stiffer than that used for true batik, and made of resin, paraffin and varnish gums) touching the block to a pad to remove the excess wax, and then printing the wax

FIG 9.—NATIVES MAKING BLOCKS FOR USE IN TJAP PRINTING

on to the material, after which the process is repeated for the back and the dyeing is proceeded with as in the case of real batik. Specimens of this work are sometimes fully as valuable as batiks. Tjap printing is not considered equal to batik, but as the tjaps must be made in pairs so as to correspond perfectly in the printing of the front and back of the fabric, and as the making of the tjaps is, in itself, a most exacting and delicate craftsmanship, the work must not be neglected by the student, who should realize that sometimes really good specimens of tjap printing are fully as valuable as batiks.

European History and Uses.—Batik was introduced into Europe by the Dutch, who, returning from Java, described the beautiful costumes of the natives. It was lectured about, and in due time some specimens were brought home by travellers, but very little attention was paid to them as works of art or to the method of execution pursued. Sporadic interest did occur, but when the Dutch acquired the islands, an industry was started in the printing of imitation batiks for sale and trade with the natives. This had an ill effect, as many people did not understand the difference between these printed atrocities and the beautiful creations of the natives, and it was not until the latter part of the 19th century that the great strides made in the production of dyes led artists to experiment with them as a medium and to the revival of this 2,000-year-old art.

Some batik in Europe and America is executed like that in Java, for the purpose of wearing apparel, but the length of time involved in producing these fabrics makes it impossible to compete with the beautifully printed and woven fabrics done by machinery and therefore the art has been driven a step higher. Artists found that they could not spend the time to design and execute a batik gown unless they could first find patrons willing to spend large sums of money for their work; therefore, the application of this art to the more permanent elements of decoration such as wall hangings, lamp shades, table runners or throws, etc., for which comparatively higher prices could be asked, was necessary. The first artists who awoke to the possibilities of this medium of expression were those in Holland; then followed such artists as Arthur Crisp, Pieter Mijer, Bertrand Hartmann and Ethelyn Stewart in America, who developed batik printing to a higher standard.

These artists, equipped with an almost unlimited range of colour, produced by modern dyes, have created designs of a beauty never before realized. Improved instruments have also aided them in obtaining good results. For instance, they now use heavier cups for the tjantings, so that the heat can be held longer, and tapering

spouts which allow the wax to stay hot until it reaches the tip. These spouts extend about half way up into the cups so that the sediment sinks to the bottom and does not clog them. The technique of the brush, which was never properly developed in Java, has been borrowed from Japan and has given its fluent vigour to the lines of these modern artists. The dyes are not only more varied, but infinitely clearer and purer in colour, and the removal of the wax by gasoline has facilitated the cleaning process. Not only is the art itself undergoing improvement; the materials upon which it is executed are becoming, due to modern machinery, more and more beautiful in their varied textures. And so batik has come to be thought of as an art comparable to painting in oils or water colours or to drawing with pastels, with the lithographic crayon or the etching point. In comparison with other arts batik has some limitations, but it has also many well-defined advantages over the other graphic arts and should, without doubt, eventually take its place among them. Swift, vigorous sketches can be executed with it. An utmost delicacy of colour is obtainable, and flat areas of rich tone as well as subtle variations of mottling and "crackling" can be had when required. Besides all these and many similar advantages, there is the possibility of the feel of material, the creation of that texture which not only appeals to the eye but to the sense of touch as well. (See CRAFTSMANSHIP.)

Modern Technique and Practice.—Modern technique varies only a little from that which has been practised in Java for centuries, the chief difference being that the Western artist prefers as a rule to do the application of wax on a horizontal or only slightly inclined table rather than on the rack which is preferred in Java. The design is generally sketched in pencil on the material, though some artists trust their ability sufficiently to do it direct with the wax itself. The application of wax is done with an improved type of tjanting or with a brush which may be pointed or wedge-shaped. The brush is usually a good type of water-colour brush made of tapered hairs, because it is necessary constantly to keep a large amount of wax in it, in order to maintain the heat that the wax may flow freely, and yet a fine point is necessary. It has become the practice to dip the brush in wax, touching it very gently to the edge of the pan so as to remove only a little, and then to take a razor blade or sharp knife and carefully trim it to a point. This practice, however, does not always produce a brush capable of the best work, especially where a line of variable width is desired, for when it is allowed to rest

FIG. 10.—NATIVE DRAWING THE DESIGN WHEN THE BORDER HAS BEEN DYED

a little more heavily while painting in order to produce a broader line, the short trimmed hairs are sure to spread unevenly. A different type of brush, preferred by some artists, is one with a wedge-shaped arrangement of hairs. This brush will, when held properly, produce a very fine line, one that can be made broader by the simple turning of the brush in the fingers. Of course, it has the disadvantage that in drawing a fine sharp curve one must learn how to twist it in the fingers in just the right way to keep the line uniform. When a brush is first put in the hot wax the bristles spread into a great bunch and it takes a few moments' manipulation to slowly press the air and moisture out so that it will resume its natural form. This process should be done slowly and with care, as it determines the form the brush will take in future use. One should always avoid touching a brush to the bottom of the pan, or for any longer than a second to the edge of the pan, as the metal is so hot that it will burn and curl up the hairs.

Cleaning.—The modern tjanting is so well made that one does not need to exercise the precautions that used to be required

in the care of the more fragile native instruments. When it becomes clogged through impurities in the wax, a fine wire, such as can be obtained on a spool at any hardware store, will quickly remove the dirt, though care should be taken in inserting the wire at the point of the spout as it is likely to cause rough edges, which may catch in the fabric and cause an unpleasant stuttering of line or even an upsetting of the tjanting, which might destroy many days' work.

Use of Tjanting.—In using the tjanting one must, first of all, take the utmost precaution to see that no wax clings to the out-

FIG. 11.—JAVANESE WOMEN, AS A RULE, APPLY THE WAX. IT WILL BE NOTED THAT, CONTRARY TO THE EUROPEAN PRACTICE, THE FABRIC IS HUNG OVER A RACK, AS SHOWN HERE

side of the cup after it has been dipped in the wax pot. The usual method is to keep in the left hand a small bit of cloth or cotton waste with which the cup is gently wiped off over the wax pot each time it is filled. Another method which has worked out satisfactorily is the scraping of the bottom of the cup with a small fragment of cardboard which has been torn or cut into a square form. Some artists use for this purpose old laundry shirt boards, the backing to blocks of paper, etc. This same cardboard may be used to advantage in taking another precaution. It is often well to cover the material between the wax pot and the part of the design being worked on with two or three pieces so that in case of a spill, due to the jogging of one's elbow, they will protect the fabric. In using the tjanting one should hold the hand with the back up and allow the tjanting to slide on the nails of the small and third fingers, if such support is necessary. The tjanting should be held delicately and without tension, and the drawing should be done with a free arm movement. It is better not to move the fingers at all, and some artists, whose nerves are not sufficiently well under control, find a wrist rest of help. When it first touches the material it is likely to leave a small globule at the beginning of the line. To avoid this it will be found that if a small piece of cardboard or a piece of paper is held in the left hand with its edge exactly where the line is to begin, and the tjanting is brought down on this paper and carried forward so that it slides off at the proper place on to the fabric, the line will commence with its usual width. It must of course, be understood, that in good work with the tjanting it is possible to make all lines of a uniform width, for any attempt to make the lines narrower or wider is likely to result in a lumpy uneven quality not to be desired. Dots of various sizes, however, can be obtained with the tjanting by the simple process of allowing it to rest a shorter or longer time on the spot and it will not be found difficult to produce these dots in perfectly round form. Under no conditions should the tjanting be held over a flame to reheat the wax, causing clogging and even melting of the solder with which the small spout is attached to the cup, thus ruining the instrument. Fine, even lines can also be obtained with the brush, and the advantage to the skilled artist is that he can make these finer or broader with a sure, even touch. Added to this advantage is that of the technique of the almost dry or cooled brush which may deposit the wax in the various textures often desired. We may say, therefore, that for finer works of art in which the artist wishes to vary the line, the brush is better adapted, while for decorative works of art where an even unbroken line is desired, the tjanting will give a more structural effect.

Wax.—The kind of wax used depends upon the result desired,

but it is usually a mixture of one-half bees-wax and one-half paraffin, to which is sometimes added a little resin, for the purpose of making it cling more securely to the fabric, and sometimes a little old wax, which makes the mixture darker. The more paraffin used the more brittle the mixture becomes when cooled, and therefore in producing the sometimes desired "crackle," the proportion of paraffin is increased. "Crackle" is an accidental texture which can be governed by the artist only with difficulty. Therefore, though it is perfectly characteristic of this art, it should not be made use of indiscriminately, and the best artists avoid it almost entirely. It is produced by the cracking up or crushing of the fabric after the wax has cooled and stiffened and then immersing it in a dye which is thus permitted to sink through the cracks and which produces irregular lines, wandering in a haphazard way wherever the wax has been broken. It is not easy to avoid crackle and in dyeing large pieces, a sufficiently large dye bath should be used to avoid crowding. It is advisable also to have the dye sufficiently warm so that the wax does not become too brittle.

The first step in treating the fabric is to wash it, as they do in Java, so as to remove all weighting or sizing, though certain craftsmen do not make use of oil, preferring to leave the fabric as clean and white as possible. It is then pressed, after having been rinsed thoroughly, and stretched either upon a frame, a piece of glass, or an enameled table-top. Sometimes this is done by painting a band of wax at the top which adheres to the surface beneath it when cooled, and then stretching the fabric evenly and painting a band at the bottom following this by the same treatment of both sides. At other times the artist, preferring to move the material into different positions, may stretch it by means of weights placed along the edges. The advantage of the frame is that the wax sinks through and is not broken, as is sometimes the case when the cooled finished piece is removed from glass or enamel. Thus it often saves re-waxing the back.

Methods of Obtaining Colours.—After the first waxing is completed, the dyeing can be proceeded with and in this, again, the western method differs from the eastern, for while the eastern craftsman dyes a colour and then removes the wax, re-waxing

FIG. 12.—THE DYEING OF BATIK IN JAVA IS USUALLY DONE BY THE MEN

other portions of the design to prepare it for the dyeing of another colour, the western craftsman through his knowledge of the mixing of colours need never recommence his waxing more than three times, once for each of the three primary colours whose combinations give all other hues. It may be well to recall at this point that there are three primary colours—red, yellow and blue—and that through the proper mixing of these colours any other colour in the spectrum can be obtained. By mixing these colours secondary colours are obtained, for red and yellow produce orange; yellow and blue, green; red and blue, purple. Making use of this fact, the western craftsman usually begins by reserving (covering with wax) that part of his design which he wishes to keep white and also that part in which no yellow is needed. When this waxing is completed he dyes the fabric a very pale yellow. Should he have use for a yellow red in his design or a yellow blue, that is a green blue, he now blocks out the sections where these colours would occur as well as the sections where he wishes to keep the shade of yellow just applied, and then dips the fabric again in a deeper yellow, reserving with the wax those sections which he intends to have orange and green or deeper yellow, and so on, keeping in mind exactly what hues he wishes to produce in each part of the design and thinking always of their intensity. When he has

BATIK HANGING, "THE LAND OF PLENTY"

An example of modern batik executed with the brush by Arthur Crisp on heavy silk. The delicate design, though original, shows traces of Eastern influence

GOTHIC BATIK HANGING

Executed on woollen cloth after a 13th century tapestry design representing King Arthur. This is a fine example of the direct technique of Miss Ethelyn Stewart, as shown in the treatment of the high-lights of the robes and the delicate but vigorous architectural ornamentation.

BY COURTESY OF N. E. COX STUDIOS

completed the dyeing of the yellows he may take up the reds or blues by first removing all the wax and then again covering those parts, which in the final fabric are to appear white or clear yellow. When this is completed he begins perhaps with a light red, dyeing it over white in certain places where he wishes the exact colour to appear, over a pale yellow where he wishes it to take this tint and over a deeper yellow where he wishes it to be orange. Thus it will be seen that modern batik makes use of colour principles not unlike those employed in the process of four-colour printing, and it may also be seen that the artist must not only be an excellent draughtsman or painter with the wax but must have a perfect knowledge of colour and of the analysis of colour, otherwise his work is sure to be a haphazard jumble of unrelated hues and values.

FIG. 13.—AFTER THE DYEING, THE WAX IS REMOVED BY WASHING THE FABRIC IN HOT WATER

The batik artist must also have a knowledge of the chemistry of modern dyes, which is a separate study (*see Dyes*). As to the technique of this side of the art, it is sufficient to state here in general that for the beginner's use there are no better dyes than those sold by reputable firms in small packages. From these or from the other acid dyes, obtainable in larger quantities wholesale, can be made concentrated solutions by boiling them in the required amount of clear water. When the experienced artist sets out to procure a certain colour he cuts a strip of the same material on which his design is to be worked and tests the colour carefully, adding a little at a time this concentrated solution to a bath of clear water, made properly acid, before immersing his work of art. In making these tests it is necessary that the small fragment of material be kept in the bath for a given length of time, as under certain conditions the longer it stays the deeper the colour. It is also necessary that this test piece of material be rinsed just as carefully and thoroughly as the artist intends to rinse his work of art, and finally, of course, the sample must be dried before it can be determined whether or not the colour is correct. The experienced artist is most careful in his testing and is never satisfied until he has obtained the exact hue desired. It is in this work alone that many amateurs fail, sometimes ruining what might otherwise be a fine piece of craftsmanship. In testing the sample, the temperature of the dye-bath, the length of time it is immersed and all other conditions must be exactly similar to those which the batik itself must undergo. When the sample is ready and seems perfect, the material should be wetted in clear water so that the dye can enter it at once, then immersed and kept moving gently through the dye solution. Some artists do this with sticks, but many prefer using their hands in spite of the discomfort involved, because in order to avoid crackle the motion must be gentle though constant. It is often wise to remove the material in just a little less time than has been given the sample, for it will be found easy, if the colour is slightly pale, to give it one or two more brief dippings, rinsing it each time thoroughly, and thus arriving at the proper result. This system of gentle approach is infinitely more satisfactory than the careless attempt at procuring the desired colour in a single operation, only to find that one has overdone it, and must resort to unsatisfactory bleaching.

Bleaching can be done with soda, ammonia or any of the well-known powders on the market, but it is very likely to attack the wax, and to work upon one colour more than another, giving the result, not of a simple paling of the hue, but of changing it to a distinctly different hue.

Removing Wax.—After the fabric has been properly dyed, the wax must be removed. This can best be accomplished by giving it a preliminary ironing between sheets of newspapers, which absorb a good deal of the wax. Then it is immersed in petrol and left to soak for some time so that a good deal of the remaining wax is dissolved. It is then carefully wrung out and

placed in another clean bath of petrol. This work should be done most carefully, away from all flames, and with no quick movements, for even a spark of static electricity, such as may be caused by a shake or flip of the material, has been known to ignite the fumes. It is advisable to have good ventilation where this cleaning is undertaken, for gasoline fumes are poisonous when concentrated and one should breathe as little of them as possible. Often an electric fan, properly placed, will solve this difficulty. When the cleaning by petrol has been accomplished the fabric should be rinsed and washed lightly in warm water and soap-suds, to remove all traces of the acid, and then pressed.

It will be seen that proper technique in batik is quite as difficult as that of etching or painting. It must be realized that this technique involves even surer understanding of line and colour, for it is practically impossible to correct a mistake in drawing once it has been made, and it is also very nearly impossible to correct a mistake in colour. This is no art for those who work with trial and error methods. It must be carried on by those who conceive clearly and completely their finished result before undertaking the first step.

In permanence, batik compares favourably with the weaving of rugs, for modern dyes are sufficiently fast to make it proof against ordinary light conditions and easily cleaned without risk. Used as lamp shades or hangings against windows, it is second only to stained glass in its brilliancy and exceeds stained glass in its delicacy and variety of texture. This is then an art centuries old, little understood, demanding the utmost in technique, lasting and varied in its possibilities. All drawings in this article are from Jasper & Mas Pirngadie, "*De Inlandsche Kunstnijverheid in Nederlandsch-Indie*" (Boek & Kunstdrukkery).

BATLEY, municipal borough, West Riding of Yorkshire, England, 8m. S.S.W. of Leeds. Pop. (1921) 36,137. It is at the junction between the E. Pennines and the Yorkshire Plain, and as such became an important market town in the 18th and early 19th century. Its situation on the south-west Yorkshire coalfield led to its rapid development as an industrial town, though it was overshadowed by the more favourably situated Dewsbury and Wakefield. The town became the centre of the heavy woollen trade, manufacturing pilot cloths, druggets, flushings, etc. The working up of old material as "shoddy" is largely carried on. Modern processes (1918-28), especially the utilization of artificial silk, have centred around Dewsbury, Batley and Wakefield. The secondary industries based on the coalfield, such as the iron-foundries and manufacturing of machinery, have suffered severely during the trade depression since 1918. The town is included since 1918 in the Parliamentary Borough of Batley and Morley. It is served by the L.N.E.R. and L.M.S.R. lines.

BATMAN, from French, *bât*, a kind of pack-saddle, hence *bât-horse* (*cheval de bât*), a horse carrying a *bât* or pack, the *bât-man* being the servant in charge of the *bât-horse*. In course of time the *bâtman* was given duties to perform more immediately about the person who employed him, e.g., an officer, such as tending his quarters, equipment, etc. The officer's *bâtman* of the 18th and early 19th centuries was, to some extent, the counterpart of the mediaeval knight's serving man. In the British service the term *batman* strictly denotes the soldier who does the general cleaning work for a Warrant Officer, the term *servant* being reserved for the soldier who performs similar duties for an officer.

BATON, the truncheon carried by a field-marshal as a sign of authority, and by a police constable (Fr. *bâton*, *baston*, from Late Lat. *basto*, a stick or staff); in heraldry (q.v.), the fourth part of a bend; in English coats of arms, only as a mark of illegitimacy, the "*baton sinister*."

In music, the baton is the name for the light, pointed stick with which a conductor directs the performances of an orchestra or choir. The use of the baton is much older than is generally sup-

posed, though in the first instance it took the form of a roll of paper, which was used for this purpose in the 15th century in Italy and elsewhere. Later, when it became customary to conduct from the harpsichord or pianoforte, the baton fell into disuse; but its employment is now universal. There is great art in the proper manipulation of the baton, which Hans Richter (*q.v.*) once termed the "most difficult instrument in the orchestra."

BATONI, POMPEO GIROLAMO (1708–1787), Italian painter, was born at Lucca. In his day, he was regarded in Italy as a great painter. Many of his pictures are in the public buildings in Rome. He had a great vogue as a portrait painter, and is said to have numbered 22 sovereigns among his sitters.

BATON ROUGE, the capital of Louisiana, U.S.A., and of East Baton Rouge parish, on the bank of the Mississippi river, at the head of deep-water navigation, about 70m. N.W. of New Orleans. It is on the Jefferson and the Mississippi river scenic highways; is served by the Illinois Central, the Missouri Pacific, and the Southern Pacific railways, the Louisiana railway and Navigation company, and (through Port Allen, across the river) by the Texas and Pacific railway; has a municipal airport and a well-equipped river port which accommodates ocean-going vessels. The population was 11,269 in 1900, 21,782 in 1920, of whom 39% were negroes, and was estimated locally at 27,832 in 1925, and at 45,000 including the suburbs.

The city is built on bluffs, well above the highest flood on record. Every street within the city limits is paved. Charm is given by old houses in the Spanish style and by sub-tropical foliage; and there are beautiful ante-bellum plantation homes in the vicinity. Sugar, cotton, rice, vegetables and fruits are the leading products of the rich surrounding country. Sugar mills, rice mills, chemical plants and woodworking factories constitute the leading industries. Division headquarters of the Yazoo and Mississippi Valley railroad (Illinois Central system) were established here in 1925, when large new passenger and freight stations were built. There is a refinery (of the Standard Oil Company of Louisiana) which has a daily capacity of 100,000 barrels of crude oil, covers 1,600ac., and employs 5,000 men. Crude oil comes to it by pipe lines from as far away as Oklahoma and Kansas, and by tank cars and steamers from Mexico, Texas and California; and from it naphtha, gasoline, refined and lubricating oils, gas and fuel oils, paraffin wax, grease, asphalt, and many other products go out to all parts of the world.

The State penitentiary and State institutions for the deaf and blind are here. South of the city, 2½m. from the capitol, is the State university and agricultural and mechanical college, on a 2,000ac. tract along the river, bought in 1920, and occupied in 1925, with 34 buildings (including a Greek theatre) at a cost of \$5,000,000. The university dates back to grants of land made by the United States to the State in 1806, 1811, and 1827 "for the use of a seminary of learning." The seminary was opened in 1800, near Alexandria, with General W. T. Sherman as superintendent. It was suspended 1863–65, destroyed by fire in 1869 and reopened within a fortnight in Baton Rouge in the building of the school for the deaf. In 1877 it became the Louisiana State university; and in the same year the State agricultural and mechanical college, which had been opened in New Orleans in 1874, was consolidated with it. In 1886 it found quarters in buildings of the United States army post, which are still used for part of the instruction. The total net enrolment in 1925–26 was 3,358. A summer forestry camp is maintained at Bogalusa.

CONDUCTOR'S BATON BY COURTESY OF MESSRS. BOOSEY AND CO.

TWO TYPES OF BATON
The baton on the left is used by a musical conductor. That on the right is the Field Marshal's baton presented by King Edward VII. to Lord Kitchener.

The Audubon sugar school of the university was established in 1891 by the sugar planters' association of Louisiana to train managers for sugar plantations. The sugar experiment station is in New Orleans. Special courses are offered in petroleum engineering.

Baton Rouge was one of the earliest French settlements in the State. It was incorporated in 1817; was the State capital from 1849 to 1862; was occupied by U.S. troops from May 1862 until the end of the Civil War, and became the capital again in 1882.

BATRACHIA, a term sometimes used for that class of vertebrates more properly called Amphibia. The class includes the frogs, toads, salamanders and caecilians. As pointed out in the article AMPHIBIA, the term Batrachia is a synonym of Salientia. It is, however, rarely used in this sense by modern students (*see* AMPHIBIA).

BATRACHOMYOMACHIA: *see* GREEK LITERATURE.

BATTA (pl. **BATTAK**, not to be confused with the Batak tribe of Palawan in the Philippines), a Proto-Malayan tribe, probably derived from mixed Mongol and Indonesian stock, of North Sumatra, living in settled communities with hereditary chiefs, popular assemblies and written codes of law. The tribe is literate, using a variety of the Devanagari alphabet, and employing hollow tree-trunks at cross-roads as post-boxes. Maize and rice are cultivated; the latter on terraces which are ploughed with the aid of buffaloes; two-storied houses are built on piles, livestock being kept below the houses; pottery, weaving, jewellery, iron-work, etc., are practised and gunpowder is manufactured. A trinity like that of Brahma, Vishnu and Siva is worshipped, the tribe having been influenced by Hindu civilization. At the same time cannibalism is practised on prisoners of war, criminals and the aged or infirm, the victim being apparently cut up and eaten alive. The eating of captives and criminals appears to be a method of satisfying revenge and conferring ignominy; in the case of the aged, it appears to be a form of pious interment, as the aged invite their own children to eat them. Though the tribe generally is patriarchal the succession to chieftainship is matrilineal, going to the chief's sister's son. Ancestral images are made of soft stone, and are sometimes reinforced by the soul of a fallen warrior inserted by means of a broth made of parts of his body sealed up in a cavity in the image. Carved sticks containing a soul which hums are used as standards in war and to drive away disease. Cannibalism seems to replace headhunting (*q.v.*). The teeth are filed and blackened.

See Marsden, *History of Sumatra* (1783); Volz, *Archiv für Anthropologie* (Braunschweig), xxvi. p. 717; 1900. (J. H. H.)

BATTA, an Anglo-Indian military term, probably derived from the Canarese *bhatta* (rice in the husk), meaning a special allowance made to officers, soldiers or other public servants in the field.

BATTAGLIA TERME, urban district, Venetia, Italy, province of Padua, 11m. S.S.W. from Padua. Pop. (1921) town 1,114, commune 2,403. It is on the eastern edge of the volcanic Euganean hills, and its warm saline springs and natural vapour grotto led the 17th-century owner, Marchese Selvatico-Estense, to build a Palladian palace. Near by is the Cattaiò (Ital. for Cathay) palace (1573), of Pio Enea Obizzi, inventor of the shell (Ital. *obice*, Fr. *obus*), after the summer palace of the Chinese court as described by Marco Polo.

BATTAKHIN, African "Arabs" of Semitic stock. They occupy the banks of the Blue Nile near Khartum, and it was against them that General Gordon fought most of his battles near the town. Their sheikh, El'Obeid, routed Gordon's troops on the 4th of September 1884, a defeat which led to the close investment of Khartum.

BATTALION, a unit or military organization numbering from 500–1,000 men, the latter figure being usually the standard in modern times. The term is used in nearly every army, and is derived through Fr. from It. *battaglione*, Med. Lat. *battalia* (*see* BATTLE). "Battalion" in the 16th and 17th centuries implied a unit of infantry forming part of the line of battle, but at first meant an unusually large *battalia* or a single large body of men formed of several *battalias*. In the British Army the infantry

battalion is commanded by a lieutenant-colonel, and consists of a headquarter wing and four companies, one of them being a machine-gun company. A similar organization prevails in most foreign armies. Until shortly before the World War the British battalion was divided into eight companies, an inconvenient tactical arrangement, and only in 1928 did the British Army come into line with Continental practice by replacing one of the former four rifle companies by a separate machine-gun company. Machine-gun battalions were formed during the World War, and although discarded since in the British Army, have been revived abroad. Engineers, train, certain kinds of artillery, and more rarely cavalry are also organized in battalions in some countries, and tanks universally.

BATTAMBANG or **BATTAMBONG** (locally Phratabong), the chief town of the north-western division of Cambodia, formerly capital of Monton Khmer, *i.e.*, "The Cambodian Division," one of the eastern provinces of Siam. It is in the midst of a fertile plain and on the river Sang Ke, which flows into the Tonle or Talé sap, the great lake of Cambodia. The town is a collection of bamboo houses of no importance, but there is a walled enceinte of some historical interest. Trade is small and is carried on by Chinese settlers, overland with Bangkok, or by water with Saigon. The population is about 5,000, two-thirds Cambodian and the remainder Chinese and Siamese. The language is Cambodian.

Battambang was taken from Cambodia by the Siamese towards the end of the 18th century, and was recognized by the French as belonging to Siam when the frontier of Cambodia was adjusted by treaty in 1867-72, but in 1904 Battambang was admitted to lie within the French sphere of influence. In March 1907 (*see SIAM*), the district of Battambang was finally ceded to the French.

BATTANNI, a small tribe on the Waziri border of the North-West Frontier Province of India from Bannu to the Gomal Valley. There are three sections. In the plains the land is divided into many small divisions, *ulās*, each forming a single plot, owned by a number of families generally closely related.

See H. A. Rose, Tribes and Castes of the Punjab and North-West Frontier Province (1911).

BATTEL or **BATTELS**, a word used at Oxford university for the food ordered by members of the college as distinct from the usual "commons"; and hence college accounts for board and provisions supplied from kitchen and buttery, and, generally, the whole of a man's college accounts.

BATTEN, SIR WILLIAM (fl. 1626-1667), British sailor, son of Andrew Batten, master in the royal navy, first appears as taking out letters of marque in 1626, and in 1638 he obtained the post of surveyor to the navy. In March 1642 he was appointed second in command under the earl of Warwick, the parliamentary admiral who took the fleet out of the king's hands. It was Vice-Admiral Batten's squadron which bombarded Scarborough when Henrietta Maria landed there and he was accused by the Royalists of directing his fire particularly on the house occupied by the queen. To the end of the first Civil War, Batten continued to patrol the English seas, and his action in 1647 in bringing into Portsmouth a number of Swedish ships of war and merchantmen, which had refused the customary salute to the flag, was approved by parliament. When the second Civil War began he was distrusted by the Independents and removed from his command. When part of the fleet revolted against the parliament, and joined the prince of Wales in Holland, May 1648, Batten went with them. He was knighted by the prince, but refused to take command of the fleet, and was allowed to return to England. At the Restoration Sir William Batten became once more surveyor of the navy. In this office he was in constant intercourse with Pepys, whose diary frequently mentions him. He died in 1667.

See Penn's Life of Sir W. Penn, and Pepys's Diary.

BATTEN, in industry a term used in joinery for a board, not more than 4 to 7 in. broad or 3 in. thick, employed for various purposes, such as for strengthening or holding together laths and other wood-work. It is also applied to the strips of wood used in roofing for the fixing of slates or tiles; such battens are

usually in sections about 2 by 1 in. On board ship the name batten is applied to a strip of wood nailed to a mast to prevent rubbing, or to fix down a tarpaulin over a hatchway, in rough weather.

BATTENBERG, the name of a family of German counts, which died out about 1314, whose seat was the castle of Kellenburg, near Battenberg, a small place in the Prussian province of Hesse-Nassau. The title was revived in 1851, when Alexander (1823-88), a younger son of Louis II., grand-duke of Hesse, contracted a morganatic marriage with a Polish lady, Countess Julia Theresa von Hauke (1825-95), who was then created countess of Battenberg. From 1858 the countess and her children were raised to the rank of princes and princesses of Battenberg, with the right to use the additional title of *Durchlaucht* or Serene Highness. In 1917 the eldest son of this union, Louis Alexander (1854-1921), who had become an admiral in the British navy, was created Marquess of Milford Haven (*see MILFORD HAVEN*, LOUIS ALEXANDER), and, at the request of King George V, the members of the family who lived in England renounced the German title of prince of Battenberg and adopted the surname of Mountbatten. The second son, Alexander Joseph (1857-89) was elected Prince Alexander I. of Bulgaria in 1879. (*see ALEXANDER OF BATTENBERG*.) Henry Maurice, the third son, married on July 23, 1885, Beatrice, youngest daughter of Victoria, queen of England, became a naturalized Englishman and was appointed captain-general and governor of the Isle of Wight and governor of Carisbrooke. He died at sea, on Jan. 20, 1896, of a fever contracted on active service with the British troops during the Ashanti War. The fourth son, Francis Joseph (1861-1924) married, in 1897, Anna, daughter of Nicholas I, prince of Montenegro, and was the author of *Die volkswirtschaftliche Entwicklung Bulgariens von 1879 bis zur Gegenwart* (Leipzig, 1891). The only daughter of the princess of Battenberg, Marie Caroline (1852-1923), was married in 1871 to Gustavus Ernest, prince of Erbach-Schönberg. (For the descendants, with three exceptions, of princes Louis Alexander and Henry Maurice *see MOUNTBATTEN*.) Princess Alice of Battenberg (b. 1885), only daughter of Prince Louis, and Victoria Eugénie (Princess Ena of Battenberg) (b. 1887), only daughter of Prince Henry, were both married before 1917, when the German title was renounced, the former to Prince Andrew of Greece, and the latter to Alphonso XIII., king of Spain. Prince Henry's youngest son, Maurice of Battenberg, was killed in action near Ypres on Oct. 27, 1914, when serving with the King's Royal Fusiliers.

BATTER, an architectural term used of the sloping surface of a wall which is thicker at the base than at the top. Battered walls are commonly used where great strength and weight are necessary in the lower parts of a construction but not in the upper, as in retaining walls and masonry of weak materials, such as sun-dried brick. Frequently the lower portions of monumental buildings are battered to give the impression of great strength, although no batter may be structurally necessary.

BATTERING RAM, a military engine used before the invention of cannon, for breaking down the walls of besieged fortresses. It consisted of a long heavy beam of timber, armed at the extremity with iron fashioned something like the head of a ram. In its simplest form the beam was carried in the hands of the soldiers, who assailed the walls with it by main force. The improved ram was composed of a longer beam, in some cases extending to 120 ft., shod with iron at one end, and suspended, either by the middle or from two points, from another beam laid across two posts. This is the kind described by Josephus (*B. J.* iii 7, 19) as having been used at the siege of Jerusalem. The ram was shielded from the missiles of the besieged by a penthouse (*vinea*) or other overhead protection. It was often mounted on wheels, which greatly facilitated its operations. A hundred soldiers at a time, and sometimes even a greater number, were employed to work it, and the parties were relieved in constant succession. No wall could resist the continued application of the ram, and the greatest efforts were always made to destroy it by various means, such as dropping heavy stones on the head of the ram and on the roof of the penthouse; another method being to seize the ram head with grapnels and then haul it up to a vertical posi-

tion by suitable windlasses on the wall of the fortress. Sometimes the besieged ran countermines under the ram penthouse; this if successful would cause the whole engine to fall into the excavation. In mediaeval warfare the low penthouse, called *cat*, was generally employed with some form of ram. (See also FORTIFICATION AND SIEGECRAFT; ENGINES OF WAR; CATAPULT.)

BATTERSEA, a south-western metropolitan and parliamentary borough of London, England, bounded north by the Thames, north-east by Lambeth, and south-east, south and west by Wandsworth. Pop. (1921) 167,739. The principal thoroughfares are Wandsworth road and Battersea Park and York roads from east to west, connected north and south with the Victoria or Chelsea, Albert and Battersea bridges over the Thames. The first two of these three are suspension bridges; the third, an iron structure, replaced a wooden bridge. An early form of the name is *Patricsey* or Peter's Island. The manor in Domesday belonged to the abbey of St. Peter, Westminster, passing under Henry VIII. to the crown, and subsequently to the family of St. John and to the earls Spencer. York road recalls the existence of a palace of the archbishops of York, occasionally occupied by them between the reigns of Edward IV. and Mary. Battersea fields, bordering the river, were formerly a favourite resort. The art of enamelling was introduced, c. 1750, at works in Battersea, examples from which are highly valued. There are several large factories by the river. The parish church of St. Mary, Church road (1776), preserves from an earlier building stained glass and monuments. Wandsworth Common and Clapham Common (220 ac.) lie partly within the borough, but the public recreation ground is Battersea Park, bordering the Thames between Albert and Victoria bridges. It was constructed by reclaiming marshy ground in 1858. Battersea has returned two members to Parliament since 1918. The borough council consists of a mayor, nine aldermen and 54 councillors. Area, 2,163 acres.

BATTERY, the action of beating, especially in law the unlawful wounding of another (see ASSAULT). The term is applied to the apparatus used in battering, hence its use in military organization for the unit of mobile artillery of all kinds. (See BATTERY MILITARY; ARTILLERY; FORTIFICATION AND SIEGECRAFT). Also used for the "pitcher" and "catcher" in baseball; for a collection of utensils, primarily of hammered copper or brass, especially in the French term *batterie de cuisine*; and for the instruments of percussion in an orchestra.

Electric Battery.—This term was formerly applied to a collection of Leyden jars, but is now used for a device for generating electricity by chemical action, or, more exactly, for a number of such devices joined up together. There are two main classes of electric batteries. In *primary* batteries, composed of a number of galvanic or voltaic "cells," "couples," or "elements," on the completion of the interactions between the substances on which the production of electricity depends the activity of the cells comes to an end, and can only be restored with the aid of a fresh supply of those substances; in *secondary* batteries, also called storage batteries or accumulators (*q.v.*), the substances after the exhaustion of the cells can be brought back to a condition in which they will again yield an electric current, by means of an electric current passed through them in the reverse direction. The first primary battery was constructed about 1799 by Alessandro Volta. In one form, the "voltaic pile," he placed a series of pairs of copper and zinc disks one above the other, separating each pair from the one above it by a piece of cloth moistened with a solution of common salt. In another form, the "couronne de tasses," he took a number of vessels or cells containing brine or dilute acid and placed in each a zinc plate and a copper plate; these plates were not allowed to touch each other within the vessels, but each zinc plate was connected to the copper plate of the adjoining vessel. In both these arrangements an electric current passes through a wire which is connected to the terminal plates at the two ends of the series. The direction of this current is from copper to zinc; the zinc in each cell being the negative and the copper the positive pole. During the time that the external connection is maintained between the two poles and the current passes in the wire, the zinc or positive plates are gradually dis-

solved and hydrogen gas is liberated at the surface of the copper, or negative plates; but when the external connection is broken this action ceases. If the materials used in the cells were perfectly pure, probably the cessation would be complete. In practice, however, even with open circuit a "local action" occurs due to the fact that the impurities in the zinc plate form miniature voltaic couples with the zinc itself, thus causing its corrosion by voltaic action; and an early improvement in the voltaic cell was the discovery, applied by W. Sturgeon in 1830, that the evil was greatly reduced if the surface of the zinc plates was amalgamated, by

being rubbed with mercury under dilute sulphuric acid. Another disadvantage of the simple cell composed of copper and zinc in dilute acid is that the current it yields rapidly falls off. The hydrogen formed by the operation of the cell does not all escape, but some adheres as a film to the negative plate, and the result is the establishment of a counter or reverse electromotive force which opposes the main current flowing from the zinc plate and diminishes its force. This phenomenon is known as "polarization," and various remedies have been tried for the evils it introduces in the practical use of primary batteries. The plan usually adopted, is either to prevent the formation of the film or to introduce into the cell some "depolarizer" which will destroy it as it is formed by oxidizing the hydrogen to water (see also ELECTROLYSIS).

The former method is exemplified in the cell invented by J. F. Daniell in 1836. Here the zinc stands in dilute sulphuric acid (or in a solution of zinc sulphate), and the copper in a saturated solution of copper sulphate, the two liquids being separated by a porous partition. The hydrogen formed by the action of the cell replaces copper in the copper sulphate, and the displaced copper, instead of the hydrogen, being deposited on the copper plate polarization is avoided. The electromotive force is about one volt. This cell has been constructed in a variety of forms to suit different purposes. In one class of batteries the diaphragm is dispensed with altogether, and the action of gravity alone is relied upon to retard the interdiffusion of the liquids. The cell of J. H. Meidinger, invented in 1859, may be taken as a type of this class. The zinc is formed into a ring which fits the upper part of a glass beaker filled with zinc sulphate solution. At the

FIG. 2.—GRAPH SHOWING DISCHARGE VOLTAGE CURVE OF T-O "DANIELL" TYPE CELL

The cell has a nominal capacity of 50 ampere hours, and a zinc consumption per ampere hour of 1.25 grammes

bottom of the beaker is placed a smaller beaker, in which stands a ring of copper with an insulated connecting wire. The mouth of the beaker is closed by a lid with a hole in the centre, through which passes the long tapering neck of a glass balloon filled with crystals of copper sulphate; the narrow end of this neck dips into the smaller beaker, the copper sulphate slowly runs out, and being specifically heavier than the zinc sulphate it collects at the bottom about the copper ring.

Depolarization by Oxidation.—Sir W. R. Grove in 1839 employed nitric acid as the oxidizing agent, his cell consisting of

a zinc positive plate in dilute sulphuric acid, separated by a porous diaphragm of unglazed earthenware from a platinum negative immersed in concentrated nitric acid. Its electromotive force is nearly two volts, but it has the objection of giving off disagreeable nitrous fumes. R. W. von Bunsen modified Grove's cell by replacing the platinum with the cheaper material, gas carbon.

Chromic acid is much used as a depolarizer, and cells in which it is employed are about as powerful as, and more con-

FROM "JOURNAL OF SCIENTIFIC INSTRUMENTS"

FIG. 3—THREE TYPES OF FÉRY CELLS FOR PRIMARY BATTERIES

The zinc plate rests on the bottom of the jar to prevent corrosion and the carbon plate, in cylinder form, is suspended a few inches above it, a solution of sal ammoniac forming the electrolyte. No porous pot is used

venient than, either of the preceding. In its two-fluid form the chromic acid cell consists of a porous pot containing amalgamated zinc in dilute sulphuric acid and a carbon plate surrounded with sulphuric acid and a solution of potassium or sodium bichromate or of chromic acid. But it is commonly used in a one-fluid form, the porous pot being dispensed with and both zinc and carbon immersed in the chromic acid solution. Since the zinc is dissolved even when the circuit is not closed, arrangements are frequently provided by which either the zinc plate alone or both plates can be lifted out of the solution when the cell is not in use. In preparing the solution the sodium salt is preferable to the potassium, and chromic acid to either.

In the cell devised by Georges Leclanché in 1868 a solid depolarizer is employed, consisting of manganese dioxide packed with fragments of carbon into a porous pot round a carbon plate. A zinc rod constitutes the positive plate, and the electrolyte is a solution of sal ammoniac. Sometimes no porous pot is employed, and the manganese dioxide and granulated carbon are agglomerated into a solid block round the carbon plate. The electromotive force is about one and a half volt. The cell is widely used for such purposes as ringing electric bells, where current is required intermittently, and for such service it will remain effective for months or years, only needing water to be added to the outer jar occasionally to replace loss by evaporation. On a closed circuit the current rapidly falls off, because the manganese dioxide is unable to oxidize all the hydrogen formed, but the cell quickly recovers after polarization.

Recent Cells.—In the *Darimont* cell, fig. 1 (cf *Engineer*, 1924, 137, 636), which is of the two-fluid type separated by a porous pot, the plates consist of carbon and zinc. The liquid depolarizer around the carbon consists largely of ferric chloride; whilst the electrolyte around the zinc consists of an emulsion formed of sodium chloride, calcium carbonate and other materials, so that the electrolyte is always maintained neutral and local action is consequently negligible. As the internal resistance remains practically constant when a given voltage has to be maintained, the number of cells required is less than usual and the voltage remains very steady during the discharge. The capacity of the cell is high and it is very suitable for use with valves for wireless work in place of accumulators. Results of tests made on a cell of this type of a normal capacity of 50 amp. hrs. are shown in fig. 2.

The cell was discharged through a resistance of 10 ohms down to 6 volts. The total current yielded amounted to 49 amp. hrs. or 62.1 watt hours. The zinc consumed per amp. hr. was 1.25 gm., the theoretical figure being 1.213.

The Féry primary battery (*Journ. Sci. Instr.* 1926, 3, 313) is a modification of the Leclanché cell. The corrosion of the zinc at the surface of the liquid and the clogging of the porous pot with insoluble crystals which occurs in the Leclanché cell are obviated by removing the zinc from the surface and placing it as a flat plate in the bottom of the cell and by dispensing with the porous pot and the contained manganese dioxide. The carbon is in the form of a long cylinder depending from the top of the cell so that its base is a short distance above the zinc plate, and a solution of sal ammoniac forms the electrolyte. When the battery is in action the zinc dissolves according to the reaction:—

and the hydrogen rises up and is deposited on the carbon and escapes, while the ammoniacal solution, being lighter, also rises to the surface, leaving the heavier zinc chloride solution at the bottom. For low currents the ammonia diffuses into the air, but with heavy currents, when it is produced too fast to escape, it unites with the zinc chloride to form a hydrate as follows:—

The hydrated oxide is, however, very soluble both in the zinc chloride solution and in the ammonium hydrate, so that it is only in the neutral zone between the two solutions or at about a quarter or a third of the height of the carbon that the crystals of the double oxychloride of zinc and ammonium are deposited, and as this is well away from the base of the carbon cylinder near to the zinc, the action of the cell is but little interfered with. The hydrogen deposited on the carbon, which would ordinarily cause polarization is oxidized through absorption of atmospheric oxygen by the carbon in the portion above the electrolyte. The carbon thus acts as a catalyst in effecting the oxidation of the hydrogen by the air. Fig. 3 shows sections of three types of these cells.

In tests made during constant discharge the internal resistance of the battery was about 0.25 ohm per cell three months after the commencement, rising to about 1 ohm per cell after nearly two years, and the zinc plates dissolved quite uniformly. Cells 10 cm. square and 22 cm. high with a zinc plate weighing 160 gm. are claimed to yield a total energy, either in continuous or interrupted service, amounting to 125 amp. hours.

In the "A D" Primary Cell (cf *Elect. Rev* [London], 1924, 94, 433) made by Le Carbone Co the central carbon plate to which the connecting terminal is fixed is held between extremely porous carbons of special manufacture. The surfaces of the carbons are so prepared that they allow gases to pass through, while they remain impervious to liquids. The carbon blocks are sur-

FROM "LE CARBONE"

FIG. 4.—THE "A D" PRIMARY CELL, WHICH ALLOWS DEPÔLARIZATION TO PROCEED THROUGH ELIMINATION OF THE HYDROGEN BY AIR ON THE UPPER PROJECTING SURFACES OF THE CARBON

rounded by wrappings of cloth bound in turn with string and rubber bands. The upper surfaces of the carbon are left well out of the electrolyte and allow depolarization to proceed through contact with air. Owing to the absence of any chemical depolarizing agent, local actions are eliminated and deterioration on standing thereby avoided. The voltage remains constant during discharge, and the ampere-hour capacity is stated to be higher than that of any other primary cell of equal dimensions.

Dry Cells.—The term "dry" cell is, in this application, used only in a relative sense to denote that the contents of the cell are in a pasty form and not sufficiently fluid to flow if the cell is in-

verted The first practical primary cell of the type in use at present was produced by Gassner in 1888. This cell consisted of a zinc can serving as anode and also as the container for the cell, a carbon rod surrounded by the depolarizing mixture, which was wrapped in cloth, and the electrolyte in the form of a jelly. The open-circuit voltage of this cell was about 1.3 volts, and its short-circuit current about 6 amperes. At first these were made of a size 2½ in. X 6 in. known as the standard dry cell. There soon appeared a miniature type known as the "flashlight" cell. About 1904 the demand for dry cells increased immensely owing to their use in automobile ignition systems, though the starting and lighting systems at present in use finally put an end to that demand. A further extensive application for these cells which still continues is for the operation of telephones, for which a special type of cell has been developed. During the last few years a large demand for dry cells has resulted from their application to the "A" circuits of radio receiving sets, and this in turn has given rise to a special type of cell adapted to the heavy demands imposed upon it in radio service. The application of batteries of miniature cells of this type for operating the "B" circuit also caused a very large expansion in the industry.

In the construction most commonly employed at present the cylindrical container consists of zinc, which serves as the zinc plate. Formerly a layer of paste made of flour, plaster of Paris, ammonium chloride, and zinc chloride was then coated around the inside of the zinc container and allowed to set. In a procedure at present largely followed a double layer of paper board is used in place of the separating paste. A carbon rod is then mounted in the centre of the case and packed around with a depolarizing paste the exact composition of which is held as a trade secret, but is stated to be approximately as follows:—

Manganese peroxide	10
Carbon or graphite	10
Sal ammoniac	2
Zinc chloride	1

Sufficient water is added to make this mixture into a paste, when the zinc chloride prevents the contents becoming too dry.

For the general construction of typical dry cells see fig. 5.

Sometimes the electrolyte is made into a jelly with such colloidal material as gum tragacanth, agar agar, gelatin, flour or starch. The electrolyte is therefore unspillable, whether the cell is completely sealed over the top, as is most common in American practice, or is provided with a vent for the escape of gas, as is common in European practice. As the cell is discharged the manganese dioxide is reduced and the effective surface of the electrode travels toward the carbon rod, which is in the centre axially with the cell. This carbon rod only serves to conduct the current out of the mixture to the terminal.

In the bag type cell the manganese dioxide mixture is contained in a cloth bag or sack as shown in fig. 6. The carbon rod with its surrounding mixture is wrapped in muslin and tied with string, forming a unit which can be placed in the zinc can, leaving sufficient space between the two for the electrolyte in the form of a paste. Spacers to separate the bag from the zinc can

FIG. 5.—DRY CELL "B" BATTERY. SHOWING CELL CONSTRUCTION

FIG. 6.—DRY CELL "B" BATTERY. SHOWING CROSS-SECTION OF CONSTRUCTION

are desirable, but are not always used. These are commonly rubber bands in the small cells, such as are used for flashlight batteries, or Manila cord, which is of considerable size in some of the foreign makes of cells. The solution of sal ammoniac and zinc chloride is thickened with flour or other similar materials and may also contain other ingredients, differing with manufacturers and kept secret by them.

In the Siemens dry cell (*Electrical Review* [London], 1927, 100, 3), which is constructed for radio purposes, the carbon electrodes are made from purified retort carbon, which is agglomerated by pressure and baking, and the second electrode is made of sheet zinc and forms the outside canister. The depolarizing paste which is tamped in the vessel consists of manganese peroxide and carbon together with some graphite, to reduce the internal resistance, and gum. The space between the zinc canister and the depolarizer is filled by pouring in a thin exciting paste consisting of a solution of sal ammoniac, flour and plaster of Paris; the cell is finally filled up with seed husks which allow for

FROM THE "ELECTRICAL REVIEW"

FIG. 7.—THREE SIEMENS DRY CELLS AND A BATTERY OF 36 CELLS

expansion, and covered with a paper disc through which two small glass ventilating tubes protrude in the case of large cells and the cell is finally sealed with pitch.

An illustration of three standard sizes of cells is shown in fig. 7. The battery shown in fig. 7 is made of 36 cells, connected in series to give a nominal e.m.f. of 50 volts; its weight is 20 lb. and maximum discharge rate 20 milliamperes.

Chemical Reactions in the Dry Cell.—These are not exactly understood, but the principal changes taking place at the electrodes may be briefly described as follows:—

The zinc in contact with the solution of ammonium chloride becomes negatively charged because of the departure of positive zinc ions Zn^{++} from its surface. As zinc dissolves in the solution, zinc ions, ammonia and hydrogen ions are produced, according to the ionic equations:—

The carbon-manganese dioxide electrode in contact with the solution of ammonium chloride becomes positively charged. This fact may be explained in at least two ways. According to the first theory, hydrogen ions (H^+) are discharged at the surface of the composite electrode and render it positive.

The manganese dioxide rapidly oxidizes the hydrogen, which would otherwise accumulate on the surface of the electrode and polarize the cell. The manganese dioxide (MnO_2) is thereby reduced to a lower state of oxidation, probably (Mn_2O_3)

According to the second theory, the manganese dioxide gives tetravalent ions (Mn^{++++}), which are reduced during the action of the cell to ions of a lower valency and thereby furnish positive charges to the electrode

The manganese dioxide thus diminishes the polarization of the cell, and is at the same time reduced to a lower state of oxidation. If the positively charged electrode (carbon-manganese dioxide) is connected with the negatively charged electrode (zinc) by a wire, a current will flow through the wire from the carbon

to the zinc. Within the cell the current will flow from the zinc through the electrolyte to the carbon-manganese dioxide.

Recent Improvements.—These have been made mainly in the attainment of increase of amperage yield, capacity, the reduction of deterioration and the improvement in dependability. These advances have been secured by care in the selection of raw materials, close control of manufacturing methods and processes, and testing of the products.

Experiments conducted by G. W. Vinal and R. M. Ritchie show that dry cells deteriorate even though they are not in service. The small cell wastes away more rapidly than the larger one. Deterioration, however, can be measurably retarded by storing the cells and battery in a cool, dry place. The user of radio apparatus when employing dry cells should not allow them to freeze. Cells must not be tapped for excessive current requirements. A marked gain in capacity is obtained by making the drain on the current light.

Desiccated cells are manufactured dry and require the addition of water before they are ready for use. Some of them are manufactured as paper-lined cells and others are of the bag type. Each cell is provided with an opening in the seal or centre of the carbon rod, through which the water necessary to make the cell active may be introduced. Some of them are also provided with a vent. Only two kinds of these cells are well known in this country, but others are now being developed. One of these, called a "reserve" cell, closely resembles an ordinary dry cell. The other, called the "add water," is of bag-type construction with an inner zinc for the electrode. When in use it contains rather more electrolyte than the ordinary dry cell.

Action of Heat.—The effect of temperature on the open-circuit voltage of dry cells is small and for most purposes can be neglected entirely. The temperature coefficient is positive within the ordinary range of temperatures; that is, an increase in temperature is accompanied by a rise in voltage.

Between 0° and 25° C (32° and 77° F) the short-circuit current increases by approximately 1 ampere for each 3° C (5.5° F) rise in temperature. At higher temperatures the rate of increase is somewhat less.

Heat produces deterioration of dry cells in two ways. First, it tends to produce leakage, this may be observed when the sticky electrolyte has oozed out around the seal of the cell. Second, it increases the rate of the chemical reactions taking place within the cell. The deterioration of the cells is usually measured by the decrease in the short-circuit current with time when the cells are stored on open circuit.

Testing of Cells.—Service tests, which are applied to gauge the efficiency of cells, include determinations of ampere-hour and watt-hour capacity at both constant current and constant resistance discharge.

Since dry cells are mostly used on circuits of which the resistance is constant or nearly so, the capacity is usually expressed as the number of hours or days that the cell will continue to give service on such a circuit. This period is calculated to the time that the terminal voltage has fallen to some arbitrary value below which the service is not satisfactory. For example, the cut-off voltage of a group of three cells for telephone service is 2.8 volts. Such service is intermittent and extends over a number of months. The capacity of dry cells may also be expressed in terms of ampere hours and watt hours, but to obtain these data it is necessary to integrate carefully measured discharge curves. In any case the capacity, whether expressed as hours, ampere hours, or watt hours, depends on the condition of the cells, the way they are made and the arbitrary choice of the cut-off voltage.

Apart from the voltage on open circuit it is necessary to determine the rate of exhaustion and the power of recuperation of the cell. In a method which has now been adopted practically as standard, the cell is discharged five minutes daily through a 4 ohm resistance until the e.m.f. falls to a value of 0.75 volt per cell.

The Open-Circuit Voltage test is usually made with a voltmeter through which some current necessarily flows. It is, therefore, not strictly an open circuit measurement, but the current

which flows through the voltmeter is generally so small that the voltage of the cell is lowered by an amount which is negligible. An accurate voltmeter of at least 100 ohms resistance per volt of the scale and having at least 50 divisions per volt should be used for this purpose. The true open-circuit voltage of cells is most conveniently obtained by measuring them with a potentiometer, but this is possible only in the laboratory.

The voltage of an unused cell is usually from 1.50 to 1.60 volts. Higher voltages are sometimes found, but do not indicate superiority of cell. Lower voltages than 1.45 volts may indicate manufacturing defects, deterioration due to age, or damage. Abnormally low values indicate probably low service capacity. Hence the open-circuit voltage test made with a voltmeter is the best test available for detecting defective cells.

The open-circuit voltage, measured by a potentiometer changes by only a small amount relatively during the life of the cell. In one instance a cell under observation for 20 years still showed 1.36 volts when measured on the potentiometer, although its resistance had increased so that a voltmeter measurement such as is described above showed only 0.215 volt.

In the short-circuit current test a deadbeat ammeter, accurately calibrated, is used. The resistance of the lead wires and shunt of the ammeter should have a value of 0.01 ohm to within 0.002 ohm. The maximum swing of the needle is taken as the short-circuit current of the cell. The lead wires are conveniently tipped with lead to make good contact and should be applied to the brass terminals of the cell. Results of tests vary with the temperature. They should be made only when the cell is at a normal room temperature; that is, about 70° F.

Intermittent tests are made to imitate the use of cells under average conditions. The three standard intermittent tests are (1) Light intermittent tests, which represent telephone and other light services. (2) Heavy intermittent test, which represents ignition service, and (3) Flashlight test, which represents flashlight service.

Besides the tests mentioned above it may be desirable to make other tests, including other physical measurements, chemical examination, noise in radio batteries, and the effect of temperature. For these no definite procedure has been established. A superficial physical examination will occasionally serve to indicate certain defects, such as loose terminals, leaking seals and flaws in the zinc (J N P)

A recent successful departure from accepted standards of "B" battery construction in the United States involves the substitution of flat cells for the usual cylindrical elements. The electrodes for these cells are made of sheet-zinc, coated on one side with a water-proof conducting plastic, the latter serving as the cathode terminal. Upon the coated side of the metal plate is stamped a mix cake consisting of a suitable mixture of manganese dioxide, carbon and electrolyte, followed by a layer of wet, pasted pulp-board and a second of coated zinc, this one with its metallic surface in contact with the pulp-board. Another mix cake is then added and the building-up process is continued until a block of the requisite number of cells has been produced. Electrical contact between cells is obtained through the coated zinc, no separate connections being provided. The whole battery is finally placed in a box and sealed.

Lalande Cell.—Second only to the Leclanché in commercial importance is the cell devised by Felix Lalande (1881) and Georges Chaperon. This element (see Lorenz, *Z Elektrochem*, vol. iv., p. 308, 1897) consists of an amalgamated zinc anode, a caustic alkali electrolyte (usually a 15 to 25% solution of sodium hydroxide), and a copper oxide depolarizer-cathode. The copper oxide may be either granular, in which case it is usually tamped into a perforated iron or copper container, or agglomerated and compacted into a cathode block. The use of heavily amalgamated zinc (1.0 to 2.5% mercury) reduces wasteful zinc corrosion to such an extent that cell deterioration with time is very slight. The evaporation of electrolyte, or the access of carbon dioxide which is also deleterious to cell action, is obviated by pouring a layer of paraffin oil over the surface of the electrolyte. The Lalande cell has an open-circuit voltage of 1.0 to 1.1 and an

operating voltage, depending on the current drain, usually ranging from 0.6 to 0.85 volt in ordinary commercial practice. Depolarization is rapid and efficient, hence large currents can be drawn from the cell. During discharge zinc goes into solution, while hydrogen is liberated at the cathode where it is oxidized to water by the copper oxide; the latter is simultaneously reduced in successive stages to metallic copper during the process. Zinc in solution appears to be largely in the form of a zincate complex (HZnO_2). Since the zinc ion concentration remains low and the voltage changes during copper oxide reduction (of the order of 0.2 volt) are small, the cell has remarkably well-sustained operating voltage during the period of service life. Cell action proceeds until the active electrodes are used up or, in case the electrolyte is the limiting factor, until zinc hydroxide [$\text{Zn}(\text{OH})_2$] or a hydrated sodium zincate of the type ($\text{NaHZnO}_2 \cdot 9\text{H}_2\text{O}$) crystallizes from the saturated solution and prevents further operation by forming non-conducting deposits on the active electrode surfaces. By the addition of small quantities of sulphur to the depolarizer as practised in the Columbia high voltage unit (manufactured in the United States), the operating voltage can be increased by about 0.1 volt.

The Lalande cell is one of the most efficient and satisfactory primary batteries known to-day for the special classes of service to which it is suited. It lends itself readily to rugged construction; it is relatively cheap to make and operate; it is very reliable in its action and has a high current output per unit of volume (about 1 ampere hour per 8 cc. of electrolyte). The cell is made in units as large as 500 to 1,000 ampere hour sizes. Because it requires no attention for long periods of time and because of its excellent continuous discharge and heavy duty characteristics, the Lalande cell is at present much used in railway signal operation. It can be made in dry or non-spillable form either by gelatinizing the caustic soda solution with small quantities of starch or by using such expedients as making a paste out of electrolyte and magnesium oxide.

Air cells of the Lalande type, in which a porous carbon accessible to air is substituted for the usual copper oxide element, are also feasible. These have an even more horizontal discharge curve than the copper oxide cell, since the potential of the cathode remains virtually unchanged during service life. The caustic soda air cell has an open circuit voltage of 1.35 to 1.45 and an operating voltage even on comparatively heavy drains above 1.0 volt—perhaps 0.4 to 0.5 volt higher than that of a standard copper oxide cell. The carbon electrode can be used repeatedly, only zinc and electrolyte requiring renewal each time the cell is completely discharged. (G. W. H.)

Carhart, "Primary Batteries," 1896. See also *Circular of the Bureau of Standards*, No. 79, "Electrical Characteristics and Testing of Dry Cells" (Washington, 1923).

BATTERY, MILITARY, the men, horses, guns and vehicles of the smallest independent artillery unit (from Fr. *battre*, to beat). The name was first employed in the British army at the time of the Crimean War, and in 1859 all existing artillery units were renamed batteries. The unit consists of four, six or eight guns with their teams, animals or tractors, and a corresponding number of vehicles for ammunition. Field batteries are horse- or tractor-drawn, and usually form an integral part of infantry divisions. Light, pack or mountain batteries, the guns of which are often carried in pieces on horses or mules, usually act independently, though in the British army some are incorporated in the divisional organization. Medium and heavy batteries, which are usually tractor-drawn, and anti-aircraft batteries, the guns of which are mounted on lorries or on travelling platforms, are normally corps or army troops, and are not allotted to divisions. (X.)

United States.—The battery is the smallest administrative unit of field artillery in the United States military service and is normally commanded by a captain. One first lieutenant and two second lieutenants complete the officer personnel. The enlisted strength varies with type of equipment. To facilitate technical operation it is organized into a battery headquarters, four gun

sections, one caisson section and one maintenance section. Each section contains the necessary personnel, animals and equipment to perform its functions effectively. The battery is a four gun unit irrespective of calibre and type. In a division it is armed with the French 75 mm. gun, model 1917. Each gun and limber, or caisson and limber, is drawn by a six-horse team (see *ARTILLERY; FORTIFICATION AND SIEGECRAFT*).

BATTHYÁNY, LOUIS (LAJOS), COUNT (1806–1849), Hungarian statesman, was born at Presburg in 1806. When Széchenyi drew nearer to the court in 1839–40, Batthyány became the leader of the opposition in the upper house. In 1847 he procured the election of Kossuth, took part in the deputation of March 15, and on March 31, 1848, became the first constitutional prime minister of Hungary. His position became extremely difficult when Jellachich and the Croats took up arms. He did his utmost, in his frequent journeys to Innsbruck, to persuade the court to condemn Jellachich and establish a strong national government at Budapest. Unfortunately, however, he was persuaded to consent to the despatch of Magyar troops to quell the Italian rising, before the Croat difficulty had been adjusted, and thenceforth his authority in Hungary declined. When Jellachich invaded Hungary, Batthyány resigned, with the intention of forming a new ministry excluding Kossuth, but this had now become impossible. Then Batthyány attempted to mediate between the two extreme parties, and subsequently raised a regiment from among his peasantry and led them against the Croats. He formed the deputation from the Hungarian diet to Prince Windischgrätz, whom the Austrian commander refused to receive. A few days later (Jan. 8, 1849) he was arrested at Budapest. As a magnate he was only indictable by the grand justiciary, as a minister he was responsible to the diet alone. At Laibach, whither he was taken, he asked that Deák might be his advocate, but this being refused, he wrote his own defence. Sentence of hanging was finally pronounced upon him at Olmütz for violating the Pragmatic Sanction, overthrowing the constitution, and aiding and abetting the rebellion. To escape this fate he stabbed himself with a small concealed dagger, and bled to death in the night of Oct. 5, 1849.

See Bertalan Szemere, *Batthyány, Kossuth, Görgei* (Ger.) (Hamburg, 1853).

BATTIADAE, descendants of Battus of Thera, who in the latter half of the 7th century B.C. led a colony from Thera to Africa, on the instructions of the Delphic oracle. This colony was given the name Cyrene, and was ruled by his descendants for seven generations as kings. On the death of the last (Arcesilaus IV.) about 450, a democracy came into power.

BATTICALOA, the administrative capital of the eastern province of Ceylon, on the east coast 69m. south-south-east of Trincomalee, situated on an island in lat. $7^{\circ} 44' \text{ N.}$ and long $81^{\circ} 52' \text{ E.}$ It is of importance for its haven and the adjacent salt lagoons. The population of the town in 1921 was 10,564; of the province (3,848 sq m.) 192,821. The old Dutch fort dates from 1682. Rice and coco-nuts are the two staple products of the district, and steamers trading round the island call regularly at the port. The lagoon is famous for its "singing fish," supposed to be shell-fish which give forth musical notes. The survivors of the Veddahs, the aboriginal inhabitants of Ceylon, inhabit rock-shelters and huts in this province. The average annual rainfall is 55½ in.; the average temperature 80.4° F. A railway joining Batticaloa to the Trincomalee-Maho line, which it joins at Galoya, is under construction.

BATTISHILL, JONATHAN (1738–1801), English composer of church music. Until 1764 he wrote chiefly for the theatre (incidental songs, pantomime music, and an opera in collaboration with Michael Arne, the son of Thomas Arne), but in 1764 he became organist of a city parish, and his later compositions are chiefly glees, part-songs and church music. In 1763 he had married a singer at Covent Garden theatre where he was harpsichordist. She retired from her profession when she married. After her death in 1777 he wrote little more. He died at Islington on Dec. 10, 1801. Batthishill published a collection of his glees in 1776, and some of his anthems and chants were printed in 1804.

BATTLE, urban district, Sussex, England, 5½ m. S.E. by S. from London by the Southern railway and 7 m. from the sea at Hastings. Pop. (1921) 2,891. Its name is derived from the conflict in 1066, which ensured to William the Norman the crown of England (see also **BATTLE ABBEY ROLL**). Before the battle, in which King Harold fell, William vowed to build an abbey on the spot if he should prove victorious, and in 1094 the consecration took place. The gatehouse at the end of the main street is Decorated; and parts of foundations of the Norman church, Perpendicular cloisters, and Early English refectory remain. A mansion incorporates some of the ancient building. The church of St. Mary is transitional Norman and later. The interests of the town lie in agricultural trade and in a considerable tourist traffic.

BATTLE, a general engagement between the armed forces, naval or military, of enemies. The word is derived from the Fr. *bataille*, and this, like the Ital. *battaglia*, and Span. *batalla*, comes from the popular Lat. *battalia*. *Battalia* was used for the array of troops for battle, and hence was applied to the body of troops so arranged, or to a division of an army, whence the use of the word "battalion" (q.v.).

A "pitched battle," loosely used as meaning almost a decisive engagement, is strictly, as the words imply, one that is fought on ground previously selected, French *bataille arrangée*, opposed to *bataille manœuvrée*, which is intended but may come off on any ground. In modern English usage the two types are distinguished by the titles "deliberate" and "encounter." With "battle," in its usual meaning of a general engagement of hostile armies, are contrasted "skirmish," a fight between small bodies ("skirmishing" technically means fighting by troops in extended or irregular order), and "action," a more or less similar engagement between larger bodies of troops. (See also **TACTICS** and **STRATEGY**.)

A "battle" is essentially a climax in which each army brings to bear all its available forces and resources, and which, therefore, by the greatness of the stake is likely to have a vital influence on the fortunes of the campaign. The term "battle" was loosely applied to many of the prolonged trench-warfare operations of the World War, e.g., Battle of the Somme, but the term was not truly justified, both because the offensive effort was punctuated by long pauses during which both sides could redistribute or relieve the forces engaged—so creating a fresh situation—and because only a small proportion of the available forces were engaged in any one episode. Certain of these episodes, e.g., the attacks of July 1 and July 14, 1916, had a better claim to be termed "battles"; but if qualified by the time test they are hardly justified by the scale test, owing to the small fraction of the armies which were actually engaged. On the other hand, their nature accords admirably with the terminology which is historically used of siege operations. The importance of this exact use of language is that it serves to place the Western front campaign in its true form as a gigantic siege.

BATTLE ABBEY ROLL. This is popularly supposed to have been a list of William the Conqueror's companions preserved at Battle Abbey, on the site of his victory over Harold. It is known to us only from 16th century versions of it published by Leland, Holinshed, and Duchesne, all more or less imperfect and corrupt. Holinshed's is much the fullest, but of its 629 names several are duplicates. The versions of Leland and Duchesne each contain many names not found elsewhere. It was so obvious that several names had no right on the roll that Camden held them to have been interpolated by the monks, "not without their own advantage." Modern writers have gone further, Sir Egerton Brydges denouncing the roll as "a disgusting forgery," and E. A. Freeman dismissing it as "a transparent fiction." An attempt to vindicate the roll was made by the last duchess of Cleveland, whose *Battle Abbey Roll* (1889) is the best guide to its contents.

It is probable that the character of the roll has been quite misunderstood. It is not a list of individuals, but only of family sur-

names, and it seems to have been intended to show which families had "come over with the Conqueror," and to have been compiled about the 14th century. The compiler appears to have been influenced by the French sound of names, and to have included many families of later settlement, such as that of Grandson, which did not come to England from Savoy till two centuries after the Conquest. The roll itself appears to be unheard-of before and after the 16th century, but other lists were current at least as early as the 15th century, as the duchess of Cleveland has shown.

BATTLE-AXE, a cleaving weapon for hand-fighting. Its use as a weapon of war dates from the bronze age. According to Homer, Agamemnon was attacked by Peisander with such a weapon. In the 11th century the Danish battle-axe was a regular part of the equipment of fighting men in England and under the Statute of Winchester of 1285 certain classes were required to maintain these weapons. In the 14th century the classic example of its effective employment was when Robert the Bruce felled Sir Henry de Bohun with a single blow the day before the battle of Bannockburn (June 23, 1314). It was sometimes the custom to secure the axe to the wrist by a chain to ensure its retention. The oldest body-guard of the English sovereigns, the Honourable Corps of Gentlemen-at-Arms, introduced battle-axes into its equipment in 1526 and for centuries all their duties were ordered to be carried out "with their axes" or "with their pole-axes." At the funeral of a sovereign the axe was carried in the left hand, reversed and draped. In 1520 "The Battle-Axe Guard of Ireland" came into existence with duties similar to those of the Yeomen of the Guard. It was disbanded in 1833. There is in the Royal Artillery a battery known as "The Battle-Axe Company" which is the descendant of the Artillery Company which distinguished itself at the capture of Martinique in 1809 and was granted a battle-axe in commemoration of the service. The original axe is now in the possession of the 25th Medium Battery, Royal Artillery, the "Battle-Axe Company."

BATTLE CREEK, a city of Calhoun county, Michigan, U.S.A., 115 m. west of Detroit, at the confluence of Battle Creek with the Kalamazoo river. It is on Federal highway 12, is served by the Michigan Central, the Grand Trunk, and the Michigan (electric) railways; and has a municipal airport just outside the city limits. The population was 18,563 in 1900, 36,104 in 1920, of whom 3,378 were foreign-born white, and 1,055 were negroes; and was estimated at 43,500 in 1926.

The Battle Creek sanatorium, housing 1,200 patients, established in 1866 by Dr. J. H. Kellogg, was a pioneer in dietetic and hygienic treatment, and is a health resort of international renown. It has also influenced the industrial development. The city's leading products are prepared cereal foods and beverages, which go to all parts of the world; and its other manufactures include cartons to hold these products; machines to line, fill, seal, and wrap the cartons; electric-light bath cabinets, oxygen-therapy and hydrotherapy apparatus, therapeutic lamps, vibratory chairs, massage tables, trusses and other appliances, farm implements, steam pumps and gas stoves. The output of the 97 establishments within the city limits in 1925 was valued at \$72,010,122.

Battle Creek college was formed in 1923 on the foundation of three schools conducted by the sanatorium: the nurses' training school, founded in 1880; the school of home economics; and the Kellogg school of physical education. Its equipment includes a summer camp on an island in Gull lake and a biological preserve of 113 acres.

Battle Creek is the trade centre for a rich farming region. The assessed valuation of property in 1927 was \$63,700,000. Within 15 m. are 20 lakes and numerous streams providing good fishing. There are three golf courses, one of them owned by the city. The site of the city was an Indian camping ground and the scene of

¹This is the same word as "scrimmage," and is derived from the Ang.-Fr. *eskrimir*, modern *escrimer*, properly to fight behind cover, now to fence. The origin of this is the O.H.G. *scirman*, to fight behind a shield, *scirm*, M.G. *Schirm*.

many early conflicts, to which it owes its name. It was settled in 1831, incorporated as a village in 1850, and chartered as a city in 1859. It has a commission form of government.

BATTLEDORE AND SHUTTLECOCK, a game played by two persons with small rackets, called battledores, made of parchment or rows of gut stretched across wooden frames, and shuttlecocks, made of a base of some light material, like cork, with trimmed feathers fixed round the top. The object of the players is to bat the shuttlecock from one to the other as many times as possible without allowing it to fall to the ground. There are Greek drawings extant representing a game almost identical with battledore and shuttlecock, and it has been popular in China, Japan, India, and Siam for at least 2,000 years. In Europe it has been played by children for centuries. A further development is Badminton (*q.v.*).

BATTLEMENT, a term given to the parapet of a wall consisting of alternating low portions known as "crenels" (hence "crenellated" walls with battlements) and high portions called "merlons." Battlements were devised in order that warriors might be protected by the merlons and yet be able to discharge arrows or other missiles through the crenels. The battlement is an early development in military architecture; it is found in Chaldea, Egypt and prehistoric Greece as well as commonly in Roman fortifications. It was in the middle ages that the battlement received its highest development, crenels being narrowed, and frequently given splayed sides, the merlons often having in the centre a thin slit sometimes cross-shaped to give the widest possible arc for the discharge of missiles. The developed mediaeval battlement was frequently bracketed out from the face of the wall and holes in its floor were furnished to allow objects to be dropped directly downward upon attacking forces. In actual siege use the battlement was usually covered with a protecting shed of timber and hides.

In the Saracen countries and in Italy, through Eastern influence, the battlement frequently takes decorative shapes, and towards the end of the Gothic period, as the military necessity decreased, the battlement became merely decorative. A similar persistence of the battlement as a purely decorative form occurs in much late Gothic throughout Europe; especially in the perpendicular work in England, when it is richly ornamented with tracery and frequently pierced as well.

For a complete discussion see Viollet-le-Duc, *Dictionnaire raisonné de l'Architecture française*, especially articles *Architecture militaire*, *Château*, *Donjon*, *Hourd*, *Machicoulis* and *Siège*. (T. F. H.)

BATTLESHIP. It is the mistaken notion of an uninformed section of the Press and public that the battleship is a warship of a settled type and that, by reason of new forms of attack, this type is now, in great measure, obsolete. Actually the term "battleship" implies the "predominant surface ship," a warship which can hit harder, and better withstand all forms of attack than any other ship afloat. Logically, therefore, if the battleship is doomed any less powerful type of warship is doomed, because speed, the one quality in which lesser ships may be superior to the battleship, is obviously not an all-sufficient defence. If the battleship cannot keep the sea owing to the menace of the submarine or the aircraft, then neither can the cruiser, the destroyer, the aircraft-carrier nor patrol and escorting vessels. This can only lead to the conclusion that in a future war all surface vessels, especially unprotected merchant ships, are helpless, in which case the fate of the British Empire is already sealed. In reality this is very far from being the case and the conception of the battleship as a senile leviathan retained by a conservative Admiralty is ridiculous. The battleship of to-day is the lineal descendant of the ship of the line of the sailing ship era, just as the cruiser is that of the frigate. Her business is to fight in company with ships of her own class and the battle fleet is really the fulcrum on which the whole of sea power hinges; remove it, and the value of a surface fleet will be negligible in the face of an enemy with more powerful warships.

In the 18th century the standard "battleship" was the 74-gun two-decker and the "super-dreadnought" of that era was the 90- to 100-gun three-decker. Steam as an auxiliary form of propulsion was installed in ships of the line about 1850; then the invention of

shell, as distinct from solid shot, hastened the advent of the iron-clad. The sailing navy died hard, owing to the conservatism of the times, and it was not until the tragic loss of the turret ship "Captain," which capsized in the Bay of Biscay, had proved the futility of combining the obsolete with the modern, that masts and sails finally disappeared from battleships. Already there had started the duel between guns and armour, a duel which continues to this day and which, in practice, necessitates a compromise with speed in all big warships.

From time to time the battleship has been declared to be useless and obsolete. The invention of the torpedo and the construction of the torpedo-boat were loudly proclaimed to have sounded her death-knell, but with these, as with all new forms of weapons, we see an example of the enduring principle that for every form of attack there is an effective form of defence. At the time, the answer to the torpedo was the crinoline-like net defence with which the battleship surrounded herself, coupled with batteries of quick-firing guns, and better watertight sub-division. With experience, the limitations of the torpedo-boat, just as those of the submarine in later times, became more apparent. The torpedo-boat, like the submarine, had to count for its success mainly on surprise. This it secured by its speed and comparative invisibility, due to the difficulty of seeing so small an object in the dark. But it was severely handicapped by bad weather, and it had no great radius of action; moreover, an antidote was found to this new menace in the destroyer—the predominant type of surface torpedo craft.

The torpedo-boat, as a type, disappeared, and the destroyer became her sea-going successor and, in turn, a yet more formidable challenge to the battleship. This new danger was met by equipping the battle fleet with attendant flotillas of destroyers, carrying a powerful armament of guns, to counter the enemy's flotilla. In addition these flotillas were given the support of fast light cruisers. It was found that, with the greatly increased speed of modern battleships, a net defence at sea was impracticable, while immunity from torpedo attack in harbour was far better secured by local booms, fixed nets and batteries to guard the entrance. On the other hand, the battleships' own defence was improved by better underwater construction, including the system known as the "bulge" (see further *TECHNICAL ASPECTS*), and by a powerful secondary armament, more efficient fire-control and laying systems for the guns and searchlights, star-shells and a number of other technical appliances. In this connection it is interesting to note that the German battle fleet broke through the massed flotillas of the Grand Fleet the night after Jutland (*q.v.*) and reached harbour with the loss of only one battleship due to destroyer attack. In the numerous destroyer attacks made during the daylight action, no capital ship was lost on either side. It may fairly be said, therefore, that the torpedo, fired from surface craft, has completely failed to render the battleship obsolete, but it should be noted that the mobility of a battle fleet is dependent on it being properly equipped with cruiser squadrons and destroyer flotillas.

Two new menaces to the surface ship generally have arisen in the shape of the elusive aeroplane capable of attacking with torpedo or bomb, and the almost invisible submarine. These in their turn have been proclaimed as being so formidable that once again the battleship is doomed, but, as in the case of the torpedo-boat, those who regard such new weapons as irresistible fail to perceive their limitations, nor do they realize that the latest design of battleship is, both in its powers of resistance and in those of offence, as much an advance on the pre-war design as that was on the first iron-clad, or the latter on the wooden three-decker. Still less do they realize that, ultimately, an effective answer to both these new perils to sea security rests on the predominant surface warship, the so-called battleship.

The torpedo- or bomb-dropping aircraft is an untried weapon, save for experiments on material. Up to date, these give no indication that the modern battleship is at the mercy of the aeroplane. The aircraft has to hit a comparatively small target when flying at very high speed, probably in the teeth of a hail of anti-aircraft gunfire. It takes several torpedoes to sink a modern battleship; a bomb, to be most effective, must be dropped, not on the heavily armoured deck, but close alongside, and timed to explode under

water to give the effect of a mine: a most difficult thing to accomplish. In practice, fleet aircraft and the anti-aircraft batteries of adjacent ships will assist in the defence, while the battleship, to-day, is so well armoured and protected under water that she can withstand such attacks just as well, if not better, than the gunfire which she has always had to endure.

In the World War the submarine signally failed against the battleship. Old battleships, unescorted, or lying stationary in the open, were naturally the victims of under-water attack; but no single battleship of the Grand Fleet was hit, much less sunk, by a submarine, even though they were constantly cruising in the narrow waters of the North Sea. On the other hand, an enemy submarine was rammed and sunk by H.M.S. "Dreadnought."

Since the War, anti-submarine measures and devices have been further developed and, although the submarine, too, has become more formidable, it is no exaggeration to say it is less of a menace to the battleship now than it was during the War. Whatever international agreements may be signed in peace-time, there can be no absolute guarantee that a desperate enemy will not use both aeroplanes and submarines to attack shipping in war-time. Aircraft attack is met by escorting aircraft and by ships' anti-aircraft guns. Outside the range of air escort, working from a shore base, such defending aircraft may have to be launched from aircraft-carriers, possibly converted merchant ships fitted with catapults, while both the peaceful trader and her escort will have to be fitted with guns capable of being used against both aircraft and submarines.

The experience of the World War showed that the most effective form of defence against submarine attack was to sail shipping in convoys (*q.v.*), with armed escorts, but such passive defence had to be supplemented by active anti-submarine operations on a very large scale. Unlike the aeroplane, the main antidote to the submarine is not the submarine, but the surface craft with detecting gear, depth charges, guns or mines. (*See SUBMARINE CAMPAIGN.*) In the World War the submarine menace, which almost secured a strangle-hold on the Allies, was mainly defeated by an array of small surface craft. These could not have operated effectively and must have been continually driven from their work, but for the covering support of destroyers and cruisers; but the latter, in turn, would have been driven from the sea by the enemy's battle-cruisers and battleships had it not been for the Grand Fleet which effectively contained the German High Sea Fleet and drove it back into harbour whenever it appeared. (*See JUTLAND and DOGGER BANK.*)

It will be seen, therefore, that the answer to the air menace to sea-borne commerce is, under certain conditions, the sea-borne aeroplane and the escort vessel with anti-aircraft guns, and to the submarine menace the convoy system, the armed escort and the array of surface submarine-hunters. It has also been demonstrated that the security against these new foes, as against the older surface raider, depends entirely on the existence of a surface navy, the most important unit of which is the "predominant surface ship"—the battleship. So well was this realized after the War that there seemed danger that the principal naval powers would embark on a race to produce the most powerful type of warship afloat. The good sense and good will of the respective governments and their naval advisers, however, effected a check on such ruinous competition and by the Washington Agreement (*q.v.*) battleships are now limited both in size and numbers. A further attempt to effect limitations in size was made by the British representatives at the naval conference at Geneva in 1927, but, although the Japanese representatives were favourably disposed towards the proposal, the United States delegates were unable to subscribe to them. In this connection, however, it should be realized that whatever limitations are imposed on the battleship by international concessions, the principle of the "predominant surface ship" remains. This type of warship might, by agreement, become the 10,000 ton or even the 5,000 ton cruiser, but, with each reduction in tonnage, the capabilities, offensive and defensive, of the ship must necessarily decline, and with them the sense of sea security. It is for this reason that responsible naval opinion is disinclined to reduce drastically the characteristics of the modern battleship.

(E. A.)

TECHNICAL ASPECTS OF BRITISH BATTLESHIPS

The modern battleship is the lineal descendant of the "ships of the line" of Nelson's day of which the "Victory," now jealously preserved in H.M. dockyard at Portsmouth, was the most famous example. Such ships are at the head of the many types of ships forming a navy. They are fitted with the most powerful armament available and form the main striking force in a naval war.

The history of the modern battleship, apart from the adoption of all improvements in materials and methods due to general scientific advance, is one of continuous rivalry between guns and armour, and when we speak of guns we must also include the shells which are fired from the guns, as a shell to do great damage must not only be fired to hit the target but must also be strong enough to penetrate the armour (*q.v.*) and explode inside the ship with devastating effect. With the gradual advance in the power of ordnance it has been necessary to provide more and more efficient protection to enable the battleship to withstand the shot and shell of the enemy, and the climax of this development was the production, in the British Navy, of the "Hood" which, although classified as a battle-cruiser (*q.v.*), may be regarded as a great fast battleship: a vessel of no less than 41,200 tons displacement, with a speed of 32 knots (36½ m. an hr.), and a cost aggregating six million pounds. Still larger vessels were projected after the World War, and four of them were actually ordered in 1921, but, owing to the Washington Agreement (*q.v.*) Great Britain cancelled the orders. By this Agreement a limit of displacement of 35,000 tons is imposed on all future capital ships.

Ships of the British Navy up to the year 1860 were still being built of wood with broadside guns after the manner of the "Victory," but shortly after 1860 the wooden sides of four vessels of the "Caledonia" class were plated with 4½ in. wrought-iron plates. "Repulse" of 1870 was the last of the wooden armourclads. It was, however, in 1859 that the great experiment was made of building an iron ship with the side covered for rather more than half the length with 4½ in. wrought iron. This vessel, the "Warrior," was 380 ft. long and 9,200 tons displacement. The largest gun in use up to that time was the 68-pounder, and the 4½ in. plates were proof against shot from this gun at a range of 100 yds. The Armstrong 100-pounder gun was introduced before the "Warrior" was completed and the ship was armed with this gun, all the armament being on the broadside. There was great opposition to building a war vessel of iron, and it is narrated that the First Lord of the Admiralty remarked to the builder: "I often wonder how I mustered sufficient courage to order the construction of such a novel vessel," to which the builder replied: "I often wonder how I mustered sufficient courage to undertake the construction of such a novel vessel." The "Warrior" was, of course, fully rigged, and her single screw machinery was of sufficient power to propel her at a speed of 14½ knots.

The "Warrior" and her sister ship, the "Black Prince," were succeeded by the "Achilles," "Minotaur," "Agincourt" and "Northumberland" of the same general type. The "Minotaur" was a vessel 400 ft. long and of 10,690 tons displacement, with the armour extending the whole length, thus protecting the vulnerable steering gear, and having a maximum thickness of 5½ in. These vessels proved too long to be handy under sail, and the next step was the production of a shorter and handier ship, the "Bellerophon," 300 ft. long, 7,550 tons, with a complete waterline belt 6 in thick, tapering to 3 in. at the stem and 4½ in. at the stern. In this ship we find an armoured battery amidships 6 in. thick. This type of ship, with a complete belt and a battery amidships, continued until the "Temeraire" 1873, in which ship the belt was 11 in. maximum thickness with an 8 in. battery amidships. There were also redoubts towards the ends of the ship, 8 in and 10 in. thick. The last of the box battery ships was the "Superb," built in 1875.

The revolving armoured turret, mounted in a low freeboard monitor, came prominently to notice during the American Civil War, when Ericsson's "Monitor" with a turret containing two 11 in. guns defeated the Confederate vessel "Merrimac." Revolving armoured turrets were first introduced into the British Navy in the "Royal Sovereign." Originally a 3-deck line-of-battle ship, she was cut down in 1862 to a height of about 7 ft. above the water

and fitted with armoured turrets and side armour. The "Monarch," designed in 1866, and the "Captain" were the two first iron turret ships built as such for the Royal Navy. Both were rigged ships, the "Monarch" carrying four 12in. guns in two circular turrets. In 1869 an experimental type of vessel, the "Devastation," was laid down, in which the armament consisted of four 35-ton guns contained in two revolving turrets of 14in. maximum thickness on the middle line. Sails were definitely abandoned as a means of propulsion and the propelling machinery was duplicated. The vessel was of low freeboard compared with her rigged predecessors, and the armour belt had a maximum thickness of 12in., tapering to 8in. at the ends of the vessel. The vessel was 285ft. in length, 9,320 tons displacement, and had a speed of 14.2 knots. The "Devastation" was a remarkably bold design, and it is not surprising that she gave rise to a bitter controversy, accentuated by the loss of the "Captain," which had too small a freeboard for a ship carrying her spread of sail. A committee of designs was appointed to examine into the design of the "Devastation"; they reported very favourably, and this ship was followed by the "Thunderer" and the "Dreadnought" of similar type with certain improvements.

During the period of 1859-73 the protecting armour of wrought-iron was successively increased in thickness to meet the more powerful guns available, and a stage was eventually reached when, owing to limitations of weight, the area of side that could be armoured had to be confined to the most vulnerable portions of the ship, amidships, where the machinery and heavy guns were situated. It was considered better to protect the vitals efficiently than to spread out armour over the whole side, of a thickness that would be useless against the enemy's fire. This principle was carried to its limit in the "Inflexible," a vessel of 320ft. in length, 11,880 tons, 14 knots with twin screws with an armoured citadel amidships 110ft. long. The armour to this citadel had a maximum thickness of 24in. in two layers. The ends of the ship were protected by horizontal decks below the waterline, 3in. thick, with cofferdams and cork packing above. The turrets, two in number, were circular, each containing two 80-ton guns, and were arranged at opposite corners of the citadel *en échelon*; the armour of these turrets was 10in. in thickness in two layers, the outer thickness being 9in. compound or steel-faced armour being used here for the first time.

Compound armour consisted of a wrought-iron plate welded to a steel plate, the result being a plate with the hardness of steel on the face to break up projectiles and with a tough wrought-iron back to prevent cracking. Successive improvements in the manufacture of this armour increased its value, as compared with wrought-iron, from 1.25 to 1.7, and it was used in the British Navy up to the year 1880. The "Ajax" and "Agamemnon" (1876) followed the "Inflexible," being rather smaller, 8,660 tons, and these ships were followed again by the "Edinburgh" and "Colossus" (1879), of 9,480 tons displacement, all of the same general type as the "Inflexible." In the latter vessels the compound type of armour was generally adopted, greatly improving their defensive power.

The vessels from "Devastation" to "Colossus" were all ships of comparatively low freeboard, with a few heavy guns and no secondary armament. The next main type of ship was the "Admiral" class, of which six were built, and "Collingwood" may be taken as typical. This ship was 325ft. long, 9,500 tons displacement. The armour belt, 18in. thick, was at the waterline only, 7ft. 6in. broad, for rather less than half the length. The armament consisted of four 12in. guns, arranged in two barbetstes at the ends of the armoured citadels, and six 6in. guns. They were provided with machinery for 16½ knots. This class was much criticized, chiefly on account of the extent of the unprotected side behind which the 6in. guns were mounted and the insufficiency of the area of protected side of the citadel.

Two special ships, "Victoria" and "Sans Pareil," were built to carry one pair of 110-ton guns in a heavily armoured turret. These guns could fire well abaft the beam, but there was a considerable arc astern over which they could not bear. It is interesting to note that this principle has been adopted in the latest vessels of the British Navy, "Nelson" and "Rodney," as will be seen later. The "Nile" and "Trafalgar" which followed were an isolated type

laid down in 1886, 345ft. long, 11,940 tons, speed 16½ knots. The waterline belt was 230ft. long and 20in. thick, and above this belt there was a redoubt 18in. thick which enclosed the bases of the turrets. Between the turrets was worked a battery 3in. to 5in. in thickness armed with 4.7in. guns. This arrangement reflected the influence of the development of small quick-firing guns and high explosive shell, in view of which it was felt that large areas of unprotected side constituted an element of serious danger. At this time the battleships of the navy consisted of a large number of varying types of ships impossible to weld into a homogeneous fighting force, but, starting with the Naval Defence act we find that ships were designed and built in groups.

The "Royal Sovereign" class, seven in number, were laid down in 1889. These vessels were 380ft. long and 14,150 tons displacement. Their armament consisted of four 13½in. guns arranged to fire over two 17in. barbets and ten 6in. guns, two each side on the main deck enclosed by 6in. armoured casemates, and three each side on the upper deck originally protected by shields but, afterwards, also enclosed in casemates. The main waterline belt was 18in. thick and 8½ft. broad, extending over a length of 250ft.; and above this to the main deck the side was protected by 4in. nickel steel armour to prevent the free perforation of the side above the belt by the smaller nature of quick-firing guns. The main belt was covered by a protective deck 3in. thick. The freeboard forward was considerably increased from previous types to improve their sea-keeping qualities, the forward guns being also raised. The "Hood," a predecessor to the present ship of that name, was generally similar but of smaller freeboard, with the main armament carried in circular revolving turrets. These ships were of 17½ knots speed.

The next development was the "Majestic" class (1894), of which there were nine. These were vessels of high freeboard, 390ft. long, 14,900 tons. The armour protection was arranged on a new principle. The belt was 9in. in thickness, but it was carried up to the main deck for a total depth of 15ft. The protective deck was level at the middle line and sloped down at the side to the bottom of the armour below water, being 3in. on the flat, 4in. on the slope. This reflected the influence of the larger quick-firing guns. Although the protection at the waterline was not sufficient to keep out the heaviest projectiles it was backed up by the deck inside. The "Majestic" class carried four 12in. guns of a new and powerful type and 12 6in. guns in armoured casemates. The speed of these ships was 17 knots. Starting with the "Majestic" class an improved type of armour, known as the Harvey process, was adopted. This armour is homogeneous and the hard face was obtained by chilling. It was more efficient than the compound armour previously employed, its efficiency as compared with wrought iron being 1.8 to 2.2. The "Canopus" class (1897), six in number, were rather smaller, being 300ft. long and 12,050 tons, and the main armour belt only 6in. thick. They were the first battleships to be fitted with Belleville water-tube boilers, and a speed of 18½ knots was obtained. The "Formidable" and "Bulwark" classes, eight in number (1898-1901), were developments of the "Majestic" design, being 400ft. long, 15,000 tons, and 18 knots speed. The armament was similar but with improved marks of guns. In these ships the Krupp type of armour was employed, this being an improvement on the Harvey process. Ships of somewhat higher speed being required, the "Duncan" class were produced, six in number. In these a 7in. belt only could be provided on the available weight, and the speed obtained was 19 knots. The secondary armament still consisted of 6in. guns. The next class was the "King Edward VII." class, eight in number, in which, beside the standard armament of four 12in. guns, four 9.2in. guns in shields on the quarters and ten 6in. guns were mounted. The side was more completely protected with a 9in. waterline belt, 8in. above the main deck and 7in. above to the upper deck, the latter forming a battery for the 6in. guns in place of isolated casemates. These ships were designed for 18½ knots. Two interesting ships were designed before the "Dreadnought" era set in, namely, "Lord Nelson" and "Agamemnon." In these ships the 6in. gun was abandoned, and the armament consisted of four 12in. guns and ten 9.2in. guns, the latter in four twin mountings and two single

mountings. The vessels were well protected with a belt of 12in. at the waterline and 8in. above to the upper deck. The speed was 18 knots, length 410ft., and displacement 16,500 tons.

The modern navy starts with the "Dreadnought," and later ships are often designated "Dreadnoughts" or "Super-Dreadnoughts." This design was the outcome of a committee of designs appointed by Sir John (later Lord) Fisher in 1904. The type started as an all big gun ship, the "Dreadnought" herself having ten 12in. guns, in five turrets, three on the centre-line and two at the sides abreast the mast, the anti-torpedo-boat armament being 24 12-pounder guns distributed over the ship. The bold step was taken of installing turbine machinery of 23,000 h.p. driving four screws, giving a speed of 21 knots. The length was 490ft. and displacement 17,900 tons.

This type was followed in all its main features in the ships laid down up to the year 1908, namely, the "Superb," "Bellerophon" and "Temeraire," "St. Vincent," "Vanguard" and "Collingwood"; but 10 to 12 4in. guns replaced the 12-pounders. In the "Neptune" and "Hercules" laid down in 1909 the five turrets were disposed differently. In the latter ship the length had increased to 510ft. and the displacement to 20,000 tons. In the next group of ships, "Orion," "Monarch," "Conqueror" and "Thunderer," the 12in. gun gives way to the 13.5in. gun, all disposed on the centre-line, two pairs forward, two pairs aft, in each case the pair nearer amidships firing over the adjacent pair, and a fifth pair right amidships. "King George V.," "Centurion," "Ajax" and "Audacious" (1910-11), were similar but slightly larger, the standard speed of 21 knots being maintained. These vessels were 555ft. long and 23,000 tons. The next step was the "Iron Duke" class, four in number, the "Iron Duke" herself being the flagship of Admiral Jellicoe while he was in command of the Grand Fleet. In these ships 10 13.5in. guns were retained but 12 6in. guns replaced the 4in. as the secondary armament. In these ships the armour belt is 12in. maximum thickness carried to the upper deck with a battery above for 10 of the 6in. guns. The length of ship was increased to 580ft. and the displacement to 25,000 tons, the speed remaining at 21 knots.

The ships of the "Queen Elizabeth" class were laid down in 1912 and completed during the World War. This class, five in number, formed a division of fast battleships of 25 knots requiring 75,000 h.p. The length was 600ft. and displacement 27,500 tons. The calibre of the main armament was increased to 15in. and the number of guns reduced to eight, two pairs at each end. The armour belt had a maximum thickness of 13in., the armour being carried to the upper deck, with a battery above for 12 of the 16 6in. guns carried. The other four 6in. guns were removed later. In this class of ship oil fuel was exclusively employed, with very great advantages especially as regards endurance. An internal bulkhead 2in. in thickness was fitted as a protection against torpedo explosion; "Bulges" are now being fitted to increase this protection still further. The ships of the "Royal Sovereign" class, four in number, were laid down 1913-14 and completed in 1916. These vessels were designed for a speed of 23 knots and had four 15in. guns with 14 6in. guns. The main armour belt was 13in. and an internal bulkhead of 1½in. thickness was provided. The "Ramillies" of this class was fitted while building with "bulge" protection against torpedo attack, and at a later date the other ships of the class were also fitted. The ships of this class were smaller than the "Queen Elizabeth," being 580ft. long and 25,750 tons.

Omitting "Hood," which is described under battle-cruisers (*q.v.*), no ship of the battleship class was laid down from 1914 until Dec. 1922, when "Nelson" and "Rodney," two ships built to the limited displacement agreed upon at the Washington Conference of 1921, were commenced. The displacement in a standard light condition was not to exceed 35,000 tons and the calibre of the guns was not to exceed 16in. "Nelson" and "Rodney," built to this displacement, carry nine 16in. guns in triple mountings with heavily armoured gun shields, all of them forward, the middle mounting being at a higher level than the others. Fire is not possible over certain bearings right aft, and this reproduces in principle the arrangement of the old "Victoria" and "Sans Pareil." Twelve 6in. guns are carried in six revolving gun houses at the

after end. The ships are designed for 23 knots, and the single funnel is well aft, giving a very strange appearance. In place of the usual tripod foremast with its cluster of bridges and control positions, as formerly adopted, a towering structure is fitted a considerable distance forward of the funnel, so that the controls, etc., are not incommoded in any way by the funnel gases. The arrangement of armour and deck protection is intended to embody all the lessons learnt during the World War. These ships were completed in 1927 and cost about £6,000,000 each.

NOTE.—Battleships of other nations are dealt with under the navies of the countries to which they belong. (W. J. B.)

BATTUE, the beating of game from cover under the sportsmen's fire; by analogy the word is used to describe any slaughter of defenceless crowds.

BATTUS, the legendary founder of the Greek colony of Cyrene in Libya (*c.* 630 B.C.). The Greeks who accompanied him were, like himself, natives of Thera, and descended partly from the race of the Minyae. Various accounts are given both of the founding of Cyrene and of the origin of the founder's name. Four kings named Battus, alternating with four named Arcesilaus, ruled in Cyrene (*q.v.*) till the fall of the dynasty about 450 B.C.

See R. W. Macan's *Herodotus IV.-VI.* (1895), vol. i., pp. 104 *et seq.* and notes.

BATU or **ROCK ISLANDS** (Dutch *Batoe*), three greater and 48 lesser islands, Dutch East Indies, W. of Sumatra, between 0° 10' N. to 0° 45' S. and 97° 50'-98° 35' E., belonging to the Ayerbangi district of the lowlands of Padang (Sumatra). They are separated by the strait of Sibirut from the Mentawi group. The three chief islands, from N to S, are Pini or Mintao, Masa, and Bala; land area 445sq.m. The islands are generally low, and covered with forest, in which the coconut palm is conspicuous. There is trade in copra, oil, and other forest produce. The natives, about 3,000 in number, are of Malayan or pre-Malayan stock, akin to those of the island of Nias to the N.W. Only about 20 of the smaller islands are inhabited.

BATU KHAN, Mongol chief, the grandson of Jenghiz Khan, succeeded his father, Juji, as king of the Kipchaks in 1223, and in 1229 followed the new khan, Ogdai, in his expedition to China. On his return the latter sent Batu to Europe at the head of an invading army which spread over Russia, Poland and Hungary, and in 1236 attacked the Bulgars of the Volga, and advanced westward to Kiev, and Hungary in the following years. Western Europe was saved only by the death of Ogdai in 1241, which necessitated Batu's return to take part in the election of a new khan. After this he settled on the river Akhtuba, and lived in great splendour at his capital, Sarai, in the present gubernia of Astrakhan. At the death of Batu in 1255 his brother Bereke succeeded to his kingdom, which extended from Lake Balkash as far west as the confines of modern Russia. See MONGOLS.

BATUM, chief town of the Autonomous Adzhar S.S.R., on the east coast of the Black sea. Lat. 41° 41' N., long 41° 38' E.; alt. 30ft.; average rainfall per annum 93.3in., the highest in the Caucasus; average temp., Jan. 43° F., Aug. 73.8° F.; Pop (1926) 45,450. Batum is a port with no docks, but has five berths accommodating 20 tank steamers in the petroleum harbour, which needs constant dredging to maintain a depth of 26-28ft., for it tends to silt. Oil comes to Batum by pipe and also by rail from Baku. The Standard Oil company has established an oil refinery at Batum, and a main pipe-line from Baku to Batum is being constructed (1928). The chief exports are naphtha, raw silk, cocoons, oil-cake, walnut and rosewood. Manganese, wool, liquorice and maize are also exported. Its chief imports are machinery, oil-boring appliances, copperas and ironware. There is a goods exchange, and a 40-ton crane, owned by the Soviet authority. Mail steamers ply between Batum and Odessa. Batum has a cathedral (1903) and a park, with citrus fruits, magnolias and palms growing in the open air. Malaria is a perpetual scourge.

It is the Bathys of antiquity, Vati of the middle ages, and was only known as Bathumi after the beginning of the 17th century, when it belonged to the Turks. It was transferred to Russia in 1878. During the 1904-05 and 1914-21 periods of war and revolution it suffered severely, but is gradually recovering.

BATWA: see **AKKAS**.

BATYPHONE, a contrabass clarinet which was the outcome of F. W. Wiprecht's endeavour to obtain a contrabass for the reed instruments. In practice, however, the instrument was found to be of little use, and it was superseded by the bass tuba. A similar attempt was made in 1843 by Adolphe Sax, and met with a like fate.

BATZ, JEAN, BARON DE (1761–1822), French Royalist, was born in Gascony on Dec. 6, 1761, and died at Chadieu, Jan. 10, 1822. At the time of the French Revolution he was grand seneschal of the duchy of Albret, and in 1789 was nominated deputy at the States General by the nobility of Nérac. In the constituent assembly De Batz was on the committee for finance; on July 3, 1790, he reported on the public debt, and he opposed the issue of assignats. On Jan. 21, 1793, the baron made a futile attempt to rescue Louis XVI., on his way to the guillotine; five months later he organized a conspiracy to help Marie Antoinette to escape from the Temple. On the failure of this plot on June 21, he left Paris for a time. His next step was to join the foreign conspiracy which aimed at the dissolution of the convention and the restoration of the monarchy. Drawing suspicion on himself by his connection with certain members of the convention, Fabre d'Eglantine, Chabot, Bazire, etc., who were accused of speculating in the public funds, De Batz was attacked on June 14, 1794, by Elie Lacoste, who accused him, before the convention, of conspiracy with Jacobins to restore the Bourbons. Of a number of proscribed men who were arrested and guillotined, De Batz was the only one to escape. After this, little is known of his movements; he served, apparently, in Condé's army till 1800, and on the return of Louis XVIII., in 1814, was made a Knight of St. Louis. In 1820 he retired to his estate at Chadieu, where he died in 1822.

See R. de Batz, *La vie et les conspirations de Jean, Baron de Batz* (1908), and *Les conspirations et la fin de Jean, Baron de Batz* (1911).

BAUAN, a municipality (with administration centre and 38 barrios or districts), of the province of Batangas, Luzon, Philippine Islands, at the head of Batangas bay, about 54m. S. of Manila by land and 91m. by sea. Pop. (1918), 27,729, of whom 13,219 were males and none were white. It is connected with Manila by railway. Bauan has a fine church and is a well-known market for "sinamay" or abacá cloth. Cloth, palm-fibre mats, fans, bamboo baskets and cotton fish-nets are made. The bay yields excellent and abundant fish. Hogs and cattle are raised for the Manila market. Oranges, sugar, corn, rice and other products are grown in the surrounding region. In 1918 it had nine manufacturing establishments with output valued at 48,300 pesos, besides 1,133 household industry establishments with output valued at 170,000 pesos. Of the 14 schools 13 were public. The language is Tagalog.

BAUBLE, a word applied to a stick with a weight attached, used in weighing; to a child's toy; and especially to the mock symbol of office carried by a court jester, a baton terminating in a figure of Folly with cap and bells; hence a term for any triviality or childish folly. The word is probably a blend of two different words, an Old French *baubel*, a child's plaything, and an Old English *babyll*, something swinging to and fro.

BAUCHI, a region of British West Africa, part of two provinces, Bauchi and Plateau, of Northern Nigeria, and noted for its tin mines. It lies north of the Benue river and west of Bornu. It includes the central Nigerian plateau—a great treeless plain over 4,000ft. above sea-level, separated from the lower plains by precipitous walls—the valley of the Gongola and other rivers, and hilly regions. In 1926 the plateau proper was detached from Bauchi provinces, and with other areas constituted the Plateau province, with the town of Jos as capital.

The upper classes are Fula, and there are some Hausa and Kanuri (Bornuese), but the bulk of the people are pagan tribes in a low state of civilization. Sixty-four tribes sufficiently differentiated from each other to speak different languages have been reported upon. Hausa is the *lingua franca* of the whole. Amongst the tribes many were cannibals, and all the pagans went about practically naked. Their usual weapons were bows and arrows,

but the tribes living on the plateau were horsemen and depended in battle on the charges of their mounted spearmen.

The name "Bauchi," which is of great antiquity, signifies the "Land of Slaves," and from the earliest times the uplands had been the hunting ground of the slave-raider.

Mohammedanism had been partly adopted by the upper classes in the 18th century, if not earlier, and a certain degree of civilization attained. Early in the 19th century the son of a Mohammedan native ruler, educated at Sokoto, accepted the flag of Dan Fodio and conquered the country for the Fula. The name of this remarkable soldier and leader was Yakoba (Jacob). His father's name was Daoud (David), and his grand-father was Abdullah, all names which indicate Arab or Mohammedan influence. The town of Bauchi and capital of the province was founded by Yakoba in the year 1809, and the emirate remained under Fula rule until the year 1902. In that year, in consequence of determined slave-raiding and the defiant misrule of the emir, a British expedition was sent against the capital, which submitted without fighting. The emir was deposed, another chief put in his place, and the country brought under British control.

Gombe, which is included in Bauchi province, is a Fula emirate independent of the emirs of Bauchi. It forms a rich and important district. It was at Burmi in this district that the last stand was made by the religious following of the defeated sultan of Sokoto, and here he was overthrown and killed in July 1903.

The tin mines on the Bauchi plateau are worked by public companies on areas leased from the government. The centre of the tin-fields is in the Jos division, where the ore had been worked and smelted by the natives for at least 100 years before exploitation by Europeans began in 1904. This was followed by a "boom" in 1910 and by 1926 the export had reached over 10,000 tons annually. A light railway had already connected Jos with the Lagos-Kano line, and in 1928 the completion of a standard gauge (3ft. 6in.) branch of the Eastern railway put the tin-fields in direct communication with Port Harcourt.

BAUDELAIRE, CHARLES PIERRE (1821–1867), French poet, was born in Paris on April 9, 1821. Baudelaire's father died in 1827, and his mother married Lieut.-Col. Aupick, who was afterwards ambassador of France at various courts. Baudelaire was educated at Lyons and at the Collège Louis-le-Grand in Paris. The irregularities of his life after he left college induced his guardians, in 1841, to send him on a voyage to India. Mr. Arthur Symonds declares that there is "something oriental in Baudelaire's genius, a nostalgia that never left him after he had seen the East." When he returned to Paris in 1843 he was of age; but in a year or two his extravagance threatened to exhaust his small patrimony, and his family obtained a decree to place his property in trust. He wandered from one address to another in Paris, spending much of his time in the studios of Delacroix, Manet, and Daumier, and the first books he published, *Le Salon de 1845* and the *Salon de 1846*, showed his real critical genius. He took part with the revolutionaries in 1848, and for some years interested himself in Republican politics, but his permanent convictions were aristocratic and catholic. Baudelaire was a slow and fastidious worker, and it was not until 1857 that he produced his first and famous volume of poems, *Fleurs du mal*. Some of these had already appeared in the *Revue des deux mondes* when they were published by Baudelaire's friend Auguste Poulet-Malassis, who had inherited a printing business at Alençon. The consummate art displayed in these verses was appreciated by a limited public, but general attention was caught by the perverse selection of morbid subjects, and the book became a by-word for unwholesomeness among conventional critics. Victor Hugo, writing to the poet, said, "Vous dotez le ciel de l'Art d'un rayon macabre, vous créez un frisson nouveau." Baudelaire, the publisher, and the printer were successfully prosecuted for offending against public morals. The obnoxious pieces were suppressed but printed later as *Les Épaves* (Brussels, 1866). Another edition of the *Fleurs du mal*, without these poems, but with considerable additions, appeared in 1861.

Baudelaire had learnt English in his childhood, and had found some of his favourite reading in the English "Satanic" romances, such as Lewis's *Monk*. In 1846–47 he became acquainted with the

works of Edgar Allan Poe, in which he discovered romances and poems which had, he said, long existed in his own brain, but had never taken shape. Poe was to him "the master of the horrible, the prince of mystery." From this time till 1865 he was largely occupied with his version of Poe's works, producing masterpieces of the art of translation in *Histoires extraordinaires* (1856), *Nouvelles Histoires extraordinaires* (1857), *Aventures d'Arthur Gordon Pym* (1858), *Eureka* (1864), and *Histoires grotesques et sérieuses* (1865). Two essays on Poe are to be found in his *Oeuvres complètes* (vols. v. and vi.). Meanwhile his financial difficulties grew upon him. He was involved in the failure of Poulet-Malassis in 1861, and in April 1864 he left Paris for Belgium, partly in the vain hope of disposing of his copyrights. He had for many years a *liaison* with a coloured woman, whom he helped to the end of his life, in spite of her gross conduct. He had recourse to opium, and in Brussels he began to drink to excess. Paralysis followed, and the last two years of his life were spent in *maisons de santé* in Brussels, and also in Paris, where he died on Aug. 31, 1867.

His other works include: *Petits Poèmes en prose*; a series of art criticisms published in the *Pays*, *Exposition universelle*; studies on Gustave Flaubert (in *L'artiste*, Oct. 18, 1857); on Théophile Gautier (*Revue contemporaine*, Sept. 1858); valuable notices contributed to Eugène Crépet's *Poètes français*; *Les Paradis artificiels, opium et haschisch* (1860); *Richard Wagner et Tannhäuser à Paris* (1861); *Un Dernier Chapitre de l'histoire des œuvres de Balzac* (1880), originally an article entitled "Comment on paye ses dettes quand on a du génie," in which his criticism is turned against his friends H. de Balzac, Théophile Gautier, and Gérard de Nerval.

BIBLIOGRAPHY.—An edition of his *Lettres* (1841–66) was issued by the Soc. du Mercure de France in 1906. His *Oeuvres complètes* were edited (1868–70) by his friend Charles Asselineau, with a preface by Théophile Gautier. Asselineau also undertook a vindication of his character from the attacks made upon it, in his *Charles Baudelaire, sa vie, son œuvre* (1869). He left some material of more private interest in a ms. entitled *Baudelaire*. See *Charles Baudelaire, souvenirs, correspondance, bibliographie* (1872), by Charles Cousin and Spoelberch de Lovenjoul; *Charles Baudelaire, œuvres posthumes et correspondances inédites* (1887), containing a journal entitled *Mon cœur mis à nu*, and a biographical study by Eugène Crépet; also *Le Tombeau de Charles Baudelaire* (1896), a collection of pieces unpublished or prohibited during the author's lifetime, edited by S. Mallarmé and others, with a study of the text of the *Fleurs du mal* by Prince A. Ourousoff; Féli Gautier, *Charles Baudelaire* (1904), with facsimiles of drawings by Baudelaire himself; A. de la Fitzelière and G. Decaux, *Charles Baudelaire* (1868) in the series of *Essais de bibliographie contemporaine*; essays by Paul Bourget, *Essais de Psychologie contemporaine* (1883), and Maurice Spronck, *Les Artistes littéraires* (1889). Among English translations from Baudelaire are *Poems in Prose*, by A. Symonds (1905), who also wrote an admirable study of the poet in *Charles Baudelaire* (1920) and translated *The Letters of Charles Baudelaire to his Mother 1833–66* (1928), which contains a complete bibliography, and a selection for the *Canterbury Poets* (1904) by F. P. Sturmf.

BAUDIER, MICHEL (c. 1580–1645), French historian, wrote, in addition to many works on French history, an *Histoire de la cour du roi de Chine* (Paris, 1626; English trans. in vol. viii of the *Collection of Voyages and Travels* of A. and J. Churchill, London, 1707–47), derived from the narrative of a Jesuit missionary. He also wrote *Vie du cardinal Ximènes* (Paris, 1635), reprinted with a notice of the author by E. Baudier (Paris, 1851), and a curious romance entitled *Histoire de l'incomparable administration de Romieu, grand ministre d'état de Raymond Bérenger, comte de Provence* (Paris, 1635).

See J. Lelong, *Bibliothèque historique de La France* (1768–78); L. Moréri, *Le Grand Dictionnaire historique* (Amsterdam, 1740).

BAUDISSIN, WOLF HEINRICH, COUNT (1789–1878), German man of letters, was born in Rantzau on Jan. 30, 1789, and died at Dresden on April 4, 1878. As secretary to the legation, he was employed by the Danish diplomatic service, between 1810–14, on missions to Stockholm, Vienna and Paris. In 1827, after travelling in Italy, France and Greece, Baudissin settled at Dresden and began to write. In collaboration with Schlegel and Tieck he translated many of Shakespeare's plays into German. *Ben Jonson und seine Schule*, 2 vols. (Leipzig, 1836), contains translations of old English drama. He translated plays from

Politik, Kultur und Aufklärung des 18ten Jahrhunderts (4 vols.) (Leipzig, 1865–67) and two plays by Coppée, *Zwei dramatische Dichtungen* (Leipzig, 1874).

BAUDRILLART, HENRI JOSEPH LÉON (1821–1892), French political economist, was born in Paris. His father, Jacques Joseph (1774–1832), was a distinguished writer on forestry. Henri was professor of economic history at the University of Paris from 1866 onwards, and from 1881 professor of political economy at the École des Ponts et Chaussées. His first work was an *Eloge de Turgot* (1846), which at once won him notice among the economists. In 1853 he published an erudite work on *Jean Bodin et son temps*; then in 1857 a *Manuel d'économie politique*; in 1860, *Des rapports de la morale et de l'économie politique*; in 1865, *La Liberté du travail*; and from 1878 to 1880, *L'Histoire du luxe . . . depuis l'antiquité jusqu'à nos jours*, in four volumes. At the instance of the Académie des Sciences Morales et Politiques he investigated the condition of the farming classes of France, and published the results in four volumes (1885, *et seq.*). He was editor of the *Constitutionnel*, and later, 1855–64, of the *Journal des économistes*.

BAUDRILLART, HENRI MARIE ALFRED (1859–), French ecclesiastic, was born in Paris Jan. 6, 1859, the son of Henri Baudrillart. He was ordained priest in 1893, and occupied the chair of history at the Catholic Institute of Paris, of which he became rector in 1907. In 1908 he became vicar-general of Paris, and in 1915 founded the Catholic committee of French propaganda abroad. In 1918 he was made a member of the Académie française, and in 1921 was consecrated titular Bishop of Himeria. In Nov. 1925 he was made a papal count and bishop assistant at the pontifical throne.

Baudrillart's works include: *La politique de Henri IV. en Allemagne* (1885); *Philippe V. et la cour de France* (1889–99) (Grand Prix Gobert); *L'église catholique*; *La renaissance et le protestantisme* (1905); *Quatre cents ans de Concordat* (1905); *La vie catholique dans la France contemporaine* (1918), etc.

BAUDRY, or BALDERICH, OF BOURGUEIL (1046 or 1047–1130), archbishop of Dol, historian and poet, was born at Meung-sur-Loire. He became abbot of Bourgueil in 1079, and archbishop of Dol in 1107.

The most important of his Latin poems, from the historical point of view, have been published in the *Historiae Francorum Scriptores*, tome iv., edited by A. Duchesne (Paris 1639–49).

His *Historiae Hierosolymitanae*, a history of the first crusade from 1095 to 1099, is drawn mainly from the anonymous *Gesta Francorum*, but some valuable information has been added by Baudry. It was very popular during the middle ages, and was used by Ordericus Vitalis for his *Historiae ecclesiasticae*; by William, archbishop of Tyre, for his *Belli sacri historia*; and by Vincent of Beauvais for his *Speculum historiale*. The best edition is that by C. Thurot, which appears in the *Recueil des historiens des croisades*, tome iv. (Paris, 1841–87). Many other works attributed to Baudry are published by J. P. Migne in the *Patrologia Latina*, tomes 160, 162, and 166 (Paris, 1844).

See *Histoire littéraire de la France*, tome xi. (1865–69); H. von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1881); C. Thurot, "Études critiques sur les historiens de la première croisade; Baudri de Bourgueil" in the *Revue historique* (1876).

BAUDRY, PAUL JACQUES AIMÉ (1828–1886), French painter, was born at La Roche-sur-Yonne (Vendée) on Nov. 7 1828, and died in Paris on Jan. 17 1886. He studied under Drolling, and carried off the Prix de Rome in 1850 by his picture of "Zenobia found on the banks of the Araxes." Baudry derived strong inspiration from Italian art with the mannerism of Coreggio, as was very evident in the two works he exhibited in the Salon of 1857, which were purchased for the Luxembourg. The works that crowned Baudry's reputation were his mural decorations, which show much imagination and a strong sense for colour, as may be seen in the frescoes in the Paris Cour de Cassation, at the château of Chantilly, and some private residences—the hôtel Fould and hôtel Paiva—but, above all, in the decorations of the Paris opera house.

See H. Delaborde, *Notice sur la vie et les ouvrages de Baudry* (1886); Ch. Ephrussi, *Baudry, sa vie et son œuvre* (1887).

BAUER, BRUNO (1809–1882), German theologian and historian, was born on Sept. 6, 1809, at Eisenberg in Saxe-Altenburg. He studied at Berlin, where he attached himself to the "Right" of the Hegelian school under P. Marheineke. In 1834 he began to teach in Berlin as a licentiate of theology, and in 1839 was transferred to Bonn. After the publication of his *Kritik der evangelischen Geschichte des Johannes* (1840) and *Kritik der evangelischen Geschichte der Synoptiker* (1841), with their destructive criticism, his licence was revoked, and he retired for the rest of his life to Rixdorf, near Berlin, where he died on April 13, 1882. The most important of his historical works is *Geschichte der Politik, Kultur und Aufklärung des 18ten Jahrhunderts* (4 vols. 1843–45).

BAUER, GUSTAV (1870–), German politician, was born at Darkehmen, East Prussia, Jan. 6 1870. He became connected at an early age with the German trade union movement, and in 1908 was elected president of the general committee of the trade unions of Germany. In 1912 he entered the Reichstag as a Social Democrat, being appointed, in Oct. 1918, secretary of State for labour in the Government of Prince Max of Baden. Appointed minister of labour under the republic in Feb. 1919, on June 21 of the same year he became president of the ministry formed to accept the Peace Treaty of Versailles, resuming shortly afterwards the former title of chancellor. In 1920 he became minister of the treasury in Hermann Müller's cabinet and shortly afterwards minister of commerce. From May 1921 until Nov. 1923 he held, conjointly, the offices of vice-chancellor and minister of the treasury in Wirth's cabinet.

BAUER, HAROLD (1873–), Anglo-American pianist, born at New Malden, near London, April 28, 1873. He began with the violin which he studied with his father and under Adolph Pollitzer, making his début at the age of ten and playing in concerts thereafter for nine years. He was then introduced to Paderewski, who was so impressed by his talents as a pianist that he advised him to take up the piano instead of the violin and undertook to give him lessons himself. The suggestion was adopted; he made his début as a concert pianist in 1893 and quickly obtained general recognition as one of the first virtuosi of the day. He made his first appearance in the United States in 1900 with the Boston Symphony Orchestra and has divided his time since between Europe and America. He became an American citizen in 1925. In 1919, with Kreisler and Pablo Casals, he founded the Beethoven Association, of New York, of which he became president. The function of this organization is to bring together artists of established reputation in a fraternity of service at annual concerts, the proceeds are devoted to musical objects.

BAUER, OTTO (1881–), Austrian politician, was born at Vienna. Bauer was one of the founders of the Socialist educational movement, "Die Zukunft." He founded with F. Adler, the theoretical Socialist periodical *Der Kampf* and collaborated on Kautsky's journal *Die Neue Zeit*. He became secretary to the parliamentary fraction of the Social Democrat party in 1904 and at once proved himself the party's most brilliant theoretician. His first work, *Die Nationalitätenfrage und die österreichische Sozialdemokratie*, treated the problem of nationality in the Dual Monarchy with deep historical insight and on lines entirely borne out by later developments.

As a prisoner of war in Russia he studied Bolshevism at first hand, and on his return to Austria in 1917 became leader of the left wing of his party, which worked for a republic and self-determination for all nationalities. He was appointed under-secretary of state for foreign affairs by Victor Adler and became minister a few days later, on the latter's death (Nov. 12 1918). He retained this post under the Austrian Republic until July 1919. After 1918 it was Bauer's brain which really guided the international and internal policy of his party which he preserved as a non-Bolshevist but advanced Socialist organization. He launched the few Socialist experiments in Austria (see his pamphlet, *Der Weg zum Sozialismus*, 1920) and the Socialist agrarian policy (*Der Kampf um Wald und Weide*, 1925; *Das Agrarprogramm der oesterr. S. D. Partei*, 1926), as well as the revised programme of the same party brought forward in 1926.

He wrote an important account of his own and his party's activities, *Die österreichische Revolution* (1923; English translation, 1925). His other chief works are *Bolshevismus oder Sozialdemokratie* (1920); *Der neue Kurs in Sowjetrussland* (1921); *Das Weltbild des Kapitalismus (in Der lebendige Marxismus, Jena, 1925)*.

BAUERNFELD, EDUARD VON (1802–1890), Austrian dramatist, was born at Vienna on Jan. 13, 1802, and died there on Aug. 9, 1890. He entered the Austrian civil service, and remained a civil servant until after the revolution of 1848, when he retired in order to devote his whole energies to the drama. His earliest essays, the comedies *Leichtsinn aus Liebe* (1831); *Das Liebes-Protokoll* (1831) and *Die ewige Liebe* (1834); *Bürgerlich und Romantisch* (1835), were very popular. Later he turned his attention to so-called *Salonstücke* (drawing-room pieces), notably *Aus der Gesellschaft* (1866); *Moderne Jugend* (1869), and *Der Landfrieden* (1869), in which he gave a gay and witty picture of Viennese social life.

A complete edition of Bauernfeld's works, *Gesammelte Schriften*, appeared in 1871–73; *Dramatischer Nachlass*, ed. by F. von Saar (1893); selected works, ed. by E. Horner (1905). See A. Stern, *Bauernfeld, Ein Dichterporträt* (1890), R. von Gottschall, "E. von Bauernfeld" (in *Unsere Zeit*, 1890), and E. Horner, *Bauernfeld* (1900).

BAUHIN, GASPARD (1560–1624), Swiss botanist and anatomist, was the son of a French physician, Jean Bauhin (1511–1582), a Protestant exile in Switzerland. He was born at Basle on Jan. 7, 1560, and studied medicine at Padua, Montpellier, and some of the celebrated schools in Germany. In 1582 he was appointed to the Greek professorship at Basle, and in 1588 to the chair of anatomy and botany. He was afterwards made city physician, professor of the practice of medicine, rector of the university, and dean of his faculty. He died at Basle on Dec. 5, 1624. His most important botanical work was his *Pinax Theatri Botanici, seu Index in Theophrasti, Dioscoridis, Plinii, et botanicorum qui a seculo scripserunt opera* (1596). He planned a *Theatrum Botanicum*, meant to be comprised in 12 parts folio, of which he finished three; only one, however, was published (1658).

His son JEAN GASPARD BAUHIN (1606–1685), was professor of botany at Basle for 30 years. His elder brother, JEAN BAUHIN (1541–1613), after studying botany at Tübingen under Leonard Fuchs (1501–1566), and travelling with Conrad Gesner, began to practise medicine at Basle, where he was elected professor of rhetoric in 1766. His great work, *Historia plantarum nova et absolutissima*, a compilation of all that was then known about botany, was not complete at his death, but was published at Yverdon in 1650–51, the *Prodromus* having appeared at the same place in 1619. He also wrote a book *De aquis medicatis* which was published in 1605.

BAULK or **BALK**, a word of Teutonic origin meaning a ridge or beam. The ridge left unploughed between furrows or ploughed fields; also the uncultivated strip of land used as a boundary in the "open-field" system of agriculture. From the meaning of something left untouched comes that of a hindrance or check, so of a horse stopping short of an obstacle, of the "baulk-line" in billiards, or of the feint of the pitcher in baseball. From the other original meaning, i.e., "beam," comes the use of the word for the cross or tie-beam of a roof, or for a large log of timber sawn to a 1 ft. or a 1½ ft. square section (see JOINERY).

BAUMBACH, RUDOLF (1840–1905), German poet, was born at Kranichfeld on the Ilm, in Thuringia, on Sept. 28, 1840, and acted as a private tutor in various Austrian towns. In Trieste he caught the popular taste with an Alpine legend, *Zlatorog* (1877), and songs of a journeyman apprentice, *Lieder eines fahrenden Gesellen* (1878), both of which ran into many editions. In 1885 he returned to Germany and was appointed ducal librarian at Meiningen, where he died on Sept. 14, 1905.

Baumbach was a poet of the vagabond school, and wrote, in imitation of his greater compatriot, Victor Scheffel, many excellent drinking songs, among which *Die Lindenwirtin* has endeared him to the German student world. But his real strength lay in narrative verse, especially when he had the opportunity of describing the scenery and life of his native Thuringia. Special mention may be made of *Frau Holde* (1881), *Spielmannslieder* (1882), *Von der Landstrasse* (1882), and *Thüringer Lieder* (1891).

BAUMÉ, ANTOINE (1728–1804), French chemist, was born at Senlis. He devised many improvements in technical processes, e.g., for bleaching silk, dyeing, gilding, purifying saltpetre, etc., but he is best known as the inventor of the hydrometer associated with his name (often in this connection improperly spelt Beaumé). His most important book is his *Éléments de pharmacie théorique et pratique* (9 editions, 1762–1818).

BAUMES LAWS, a series of criminal laws enacted in New York State in 1926 upon the recommendation of the crime commission of which Senator Caleb H. Baumes was chairman. The passing of these laws was induced by an unusually active period of wanton crime, involving frequent bloodshed. One of the new laws prohibited sawed-off guns and machine guns equally with pistols, and heavily penalized the possession of any of these in a vehicle as well as on the person. Another, which caused consternation among criminals, provided that in cases where a felon convicted of a first offence was armed with a pistol while committing crime, five to 10 years should be added to the sentence. For the second offence 10 to 15 years, and for the third 15 to 25 years' additional imprisonment was ordered. The fourth conviction entailed life imprisonment.

The crime commission of the State of New York reported in 1927 that these laws had been so effective that many New York criminals had departed to other States. Murders of citizens resulting from robberies decreased 58% in 1927 compared with 1926, and 61% compared with 1925. Murders of police officers had decreased 44% compared with 1925 and 1926. In 1927 Senator Baumes introduced two bills aiming to strengthen the law in punishing "fences" or receivers of stolen property. One provided that a thief's testimony should be considered even if uncorroborated; the other declared that any person not making reasonable inquiry into the right of another to sell him goods should be held responsible if he bought stolen property. Defeated in 1927, these bills were re-introduced in 1928.

See files of the New York Times: March 26, Aug. 8, Oct. 26 and Dec. 15, 1926; Dec. 15 and March 28, 1927. See also records of N.Y. State crime commission, 1926.

BAUMGARTEN, ALEXANDER GOTTLIEB (1714–1762), German philosopher, was born in Berlin. He studied at Halle, and became professor of philosophy at Halle and at Frankfurt. He was a disciple of Leibnitz and Wolff, and was distinguished for separating aesthetics from the other philosophic disciplines, and in marking out a definite object for its researches. Baumgarten's first work preceded those of Burke, Diderot, and P. André, and Kant had a great admiration for him. His most important works are: *Disputationes de nonnullis ad poema pertinentibus* (1735); *Aesthetica* (1750); *Metaphysica* (1739); *Ethica philosophica* (1740); *Initia philosophiae practicae primae* (1760). After his death, his pupils published a *Philosophia Generalis* (1770) and a *Jus Naturae* (1705).

See Meier, *Baumgarten's Leben* (1763); Abbt, *Baumgarten's Leben und Charakter* (1765); H. G. Meyer, *Leibnitz und Baumgarten* (1874); J. Schmidt, *Leibnitz und Baumgarten* (Halle, 1875); Zimmermann, *Gesch. der Aesthetik* (Vienna 1858).

His brother, SIEGMUND JACOB BAUMGARTEN (1706–1757), was professor of theology at Halle, and applied the methods of Wolff to theology. His chief pupil, Johann Salomo Semler is sometimes called the father of German rationalism. Baumgarten, though he did not renounce the Pietistic doctrine, began the process which Semler completed. His works include *Evangelische Glaubenslehre* (1759); *Auszug der Kirchengeschichte* (1743–62).

See Life by Semler (Halle, 1758).

BAUMGARTEN, MICHAEL (1812–1899), German Protestant theologian, was born at Haseldorf in Schleswig-Holstein on March 25, 1812. He studied at Kiel University (1832), and became professor ordinarius of theology at Rostock (1850). At a pastoral conference in 1856 he defended evangelical freedom as regards the legal sanctity of Sunday. He was deprived of his professorship in 1858 for this and other attempts to liberalize religion. In 1865 he helped to found the *Deutsche Protestanten-verein*, but withdrew from it in 1877. On several occasions (1874, 1878) he sat in the Reichstag as a Progressive.

H. H. Studt published his autobiography in 1891; see also C. Schwartz, *Neueste Theologie* (1869); Lichtenberger, *Hist. Germ. Theol.*, 1889; Calwer-Zeller, *Kirchen-Lexikon*.

BAUMGARTEN-CRUSIUS, LUDWIG FRIEDRICH OTTO (1788–1842), German Protestant divine, was born at Merseburg, and studied theology and philology at Leipzig. After acting as *Privatdocent* at Leipzig, he was, in 1812, appointed professor extraordinarius of theology at Jena, where he remained to the end of his life rising gradually to the head of the theological faculty. He died on May 31, 1842. His published works include: *Lehrbuch der christlichen Sittenlehre* (1826); *Grundzüge der biblischen Theologie* (1828); *Lehrbuch der Dogmengeschichte* (1832); *Compendium der Dogmengeschichte* (1840). The last, perhaps his best work, was left unfinished, but was completed from his notes in 1846 by Karl Hase.

BAUR, FERDINAND CHRISTIAN (1792–1860), leader of the Tübingen school of theology, was born in Schmiden, near Cannstatt, on June 21, 1792. After receiving an early training in the theological seminary at Blaubeuren, he went in 1809 to the University of Tübingen. In 1817 Baur returned to the theological seminary at Blaubeuren as professor. He had already, in 1817, written a review of G. Kaiser's *Biblische Theologie* for Bengel's *Archiv für Theologie* (ii. 656); its tone was moderate and conservative. His first important work, *Symbolik und Mythologie oder die Naturreligion des Altertums* (1824–25) showed signs of the influence of Schelling and more particularly of Friedrich Schleiermacher. In 1826 he was appointed professor of theology at Tübingen. It is with Tübingen that his greatest literary achievements are associated. His earlier publications here treated of mythology and the history of dogma. *Das manichäische Religions-system* appeared in 1831, *Apollonius von Tyana* in 1832, *Die Christliche Gnosis* in 1835, and *Über das Christliche im Platonismus oder Sokrates und Christus* in 1837. Meantime Baur had adopted completely the Hegelian philosophy of history. "Without philosophy," he has said, "history is always for me dead and dumb." The change of view is illustrated clearly in the essay, published in the *Tübinger Zeitschrift* for 1831, on the Christ-party in the Corinthian Church. Baur contends that St Paul was opposed in Corinth by a Jewish-Christian party, and finds traces of a keen conflict of parties in the post-apostolic age. The theory is further developed in a later work (1835, the year in which David Strauss' *Leben Jesu* was published), *Über die sogenannten Pastoralbriefe*. In this Baur attempts to prove that the false teachers mentioned in the Epistles to Timothy and Titus are the Gnostics, particularly the Marcionites, of the second century, and consequently that the Epistles were produced in the middle of this century in opposition to Gnosticism. In *Paulus, der Apostel Jesu Christi, sein Leben und Wirken, seine Briefe und seine Lehre* (1845) he contends that only the Epistles to the Galatians, Corinthians and Romans are genuinely Pauline, and that the Paul of Acts is a different person from the Paul of these genuine Epistles, the author being a Paulinist who is at pains to represent Peter as far as possible as a Paulinist and Paul as far as possible as a Petrinist. Those writings alone he considers genuine in which the conflict between Jewish-Christians and Gentile-Christians is clearly marked. In his *Kritische Untersuchungen über die kanonischen Evangelien, ihr Verhältniss zu einander, ihren Charakter und Ursprung* (1847) he maintains that the authors were conscious of the conflict of parties; the Gospels reveal a mediating or conciliatory tendency (*Tendenz*) on the part of the writers or redactors. The Gospels, in fact, are adaptations or redactions of an older Gospel, such as the Gospel of the Hebrews, of Peter, of the Egyptians, or of the Ebionites. The Petrine Matthew bears the closest relationship to this original Gospel (*Urevangelium*); the Pauline Luke is later and arose independently; Mark represents a still later development; the account in John is idealistic: it "does not possess historical truth, and cannot and does not really lay claim to it." He found in the conflict between Petrinism and Paulinism the key to the literature of the 1st and 2nd centuries.

But Baur was a theologian and historian as well as a Biblical critic. As early as 1834 he published a strictly theological work,

Gegensatz des Katholicismus und Protestantismus nach den Prinzipien und Hauptdogmen der beiden Lehrbegriffe, a strong defence of Protestantism on the lines of Schleiermacher's *Glaubenslehre*, and a vigorous reply to J. Möhler's *Symbolik* (1833). This was followed by his larger histories of dogma, *Die Christliche Lehre von der Versöhnung in ihrer geschichtlichen Entwicklung bis auf die neueste Zeit* (1838), *Die Christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes in ihrer geschichtlichen Entwicklung* (1841-43), and the *Lehrbuch der Christlichen Dogmengeschichte* (1847). The value of these works is impaired somewhat by Baur's habit of making the history of dogma conform to the formulae of Hegel's philosophy, a procedure "which only served to obscure the truth and profundity of his conception of history as a true development of the human mind" (Pfeiderer). Baur, however, soon came to attach more importance to personality, and to distinguish more carefully between religion and philosophy. The change is marked in his *Epochen der kirchlichen Geschichtsschreibung* (1852), *Das Christentum und die Christliche Kirche der drei ersten Jahrhunderte* (1853) and *Die Christliche Kirche von Anfang des vierten bis zum Ende des sechsten Jahrhunderts* (1859), works preparatory to his *Kirchengeschichte*, in which the change of view is specially pronounced. The *Kirchengeschichte* was published in five volumes during the years 1853-63, partly by Baur himself, partly by his son, Ferdinand Baur, and his son-in-law, Eduard Zeller, from notes and lectures which the author left behind him. Pfeiderer describes this work, especially the first volume, as "a classic for all time." "Taken as a whole, it is the first thorough and satisfactory attempt to explain the rise of Christianity and the Church on strictly historical lines, i.e., as a natural development of the religious spirit of our race under the combined operation of various human causes" (*Development of Theology*, p. 288). Baur's lectures on the history of dogma, *Ausführliche Vorlesungen über die Christliche Dogmengeschichte*, were published later by his son (1865-68).

Baur's views were revolutionary and often extreme; but, whatever may be thought of them, it is admitted that as a critic he rendered a great service to theological science.

BIBLIOGRAPHY.—A full account of F. C. Baur's labours, and a complete list of his writings will be found in the article in Herzog-Hauck, *Realencyklopädie*, in which his work is divided into three periods: (1) "Philosophy of Religion," (2) "Biblical Criticism," (3) "Church History." See also H. S. Nash, *The History of the Higher Criticism of the New Testament* (1901); Otto Pfeiderer, *The Development of Theology in Germany since Kant* (trans. 1890); Carl Schwarz, *Zur Geschichte der neuesten Theologie* (Leipzig, 1869); R. W. Mackay, *The Tübingen School and its Antecedents* (1863); A. S. Farrar, *A Critical History of Free Thought in reference to the Christian Religion* (Bampton Lectures, 1862); and cf. the article on "The Tübingen Historical School," in *Bibliotheca Sacra*, vol. xix. No. 73, 1862.

BAUT: see CASTE.

BAUTAIN, LOUIS EUGÈNE MARIE (1796-1867), French philosopher and theologian, was professor of philosophy at Strasbourg from 1819 to 1828, when he took holy orders. In 1849 he settled in Paris where he was vicar of the diocese, and in 1853 became professor of moral philosophy in the theological faculty of the university. Like the Scholastics Bautain distinguished between reason and faith, but, inspired by the Kantian view that reason can never yield knowledge of things in themselves, he so undervalued reason that he was required in 1835, 1840-1844 to sign articles denying that the existence of God, the spirituality and immortality of the soul, the principles of metaphysics, and the credibility of revelation, are beyond the powers of reason.

Many of his theories may well be compared with the arbitrary mysticism of van Helmont and the Gnostics. The most important of his works are: *Philosophie du Christianisme* (1835); *Psychologie expérimentale* (1839), new edition entitled *Esprit humain et ses facultés* (1859); *Philosophie morale* (1842); *Religion et liberté* (1848); *La Morale de l'évangile comparée aux divers systèmes de morale* (Strasbourg, 1827); *De l'éducation publique en France au XIX^e siècle* (1876). See De Rigny: *L'abbé Bautain, sa vie et ses oeuvres* (1884).

BAUTZEN, capital of the eastern division of the republic of Saxony, Germany. Pop. (1890) 21,515; (1925) 40,335. It lies on the right bank of the Spree, not far from its source, 680ft.

above sea and 32m. E.N.E. of Dresden. The settlement dates from before the conquest of Lusatia by Henry the Fowler in 928. It became a town and fortress under Otto I., his successor, and the pilgrimages made to the "arm of St. Peter," preserved in one of the churches, caused its growth. It suffered during the Hussite and Thirty Years' Wars, and was burned in 1634. In the following year, at the Peace of Prague, it passed with Lusatia to Saxony as a war indemnity. The cathedral of St. Peter (15th century), with a tower 300ft. in height, has been used by both Protestants and Roman Catholics since 1635, an iron screen separating the two portions. Bautzen has a famous grammar school (*gymnasium*). Metal working (notably in aluminium) is carried on, and the general manufactures include wagons, woollen goods (stockings and cloth), linen and cotton goods, leather and paper.

BATTLE OF BAUTZEN, 1813

The town gives its name to a great battle in which, on May 20 and 21, 1813, Napoleon I. defeated an allied army of Russians and Prussians (see NAPOLEONIC CAMPAIGNS). The position chosen by the allies as that in which to receive the attack of Napoleon ran south-west to north-east from Bautzen on the left to the village of Gleina on the right. Bautzen itself was held as an advanced post of the left wing (Russians), the main body of which lay 2m. to the rear (east) near Jenkwitz. On the heights of Burk, 2½m. N.E. of Bautzen, was Kleist's Prussian corps, with Yorck's in support. On Kleist's right at Pliskowitz (3m. N.E. of Burk) lay Blücher's corps, and on Blücher's right, formed at an angle to him, and refused towards Gleina (7m. N.E. by E. of Bautzen), were the Russians of Barclay de Tolly. The country on which the battle was fought abounded in strong defensive positions, some of which were famous as battlegrounds of the Seven Years' War. The whole line was covered by the river Spree, which served as an immediate defence for the left and centre and an obstacle to any force moving to attack the right; moreover the interval between the river and the position on this side was covered with a network of ponds and watercourses. Napoleon's right and centre approached (on a broad front owing to the want of cavalry) from Dresden by Bischofswerda and Kamenz; the left under Ney, which was separated by nearly 40m. from the left of the main body, was ordered to march via Hoyerswerda, Weisig and Klitz on to the allies' right rear. At noon on the 20th, Napoleon, after a prolonged reconnaissance, advanced the main army against Bautzen and Burk, leaving the enemy's right to be dealt with by Ney on the morrow. He equally neglected the extreme left of the allies in the mountains, judging it impossible to move his artillery and cavalry in the broken ground there. Oudinot's corps, the extreme right wing, was to work round by the hilly country to Jenkwitz in rear of Bautzen, Macdonald's corps was to assault Bautzen, and Marmont's corps to cross the Spree and attack the Prussians posted about Burk. These three corps were directed by Soult. Farther to the left, Bertrand's corps was held back to connect with Ney, who had then reached Weissig with the head of his column. The Guard and other reserves were in rear of Macdonald and Marmont. Bautzen was taken without difficulty; Oudinot and Marmont easily passed the Spree on either side, and were formed up on the other bank of the river by about 4 P.M. A heavy and indecisive combat took place in the evening between Oudinot and the Russian left, directed by the tsar in person, in which Oudinot's men made a little progress towards Jenkwitz. Marmont's battle was more serious. The Prussians were not experienced troops, but were full of ardour and hatred of the French. Kleist made a stubborn resistance on the Burk ridge, and Bertrand's corps was called up by Napoleon to join in the battle; but part of Blücher's corps fiercely engaged Bertrand, and Burk was not taken till 7 P.M. The French attack was much impeded by the ground and by want of room to deploy between the river and the enemy. But Napoleon's object in thus forcing the fighting in the centre was achieved. The allies, feeling there the weight of the French attack, gradually drew upon the reserves of their left and right to sustain the shock.

Napoleon cared but little that the French centre was almost fought out; it had fulfilled its mission, and on the 21st the decisive

point was to be Barclay's position. Soon after daybreak fighting was renewed along the whole line; but Napoleon lay down to sleep until the time appointed for Ney's attack. To a heavy counter-stroke against Oudinot, which completely drove that marshal from the ground won on the 20th, the emperor paid no more heed than to order Macdonald to support Oudinot. For in this second position of the allies, which was far more formidable than the original line, the decisive result could be brought about only by Ney. That commander had his own corps, the corps of Victor and of Lauriston and the Saxons under Reynier, a total force of 60,000 men. Lauriston, at the head of the column, had been sharply engaged on the 19th, but had spent the 20th in calculated inaction. Early on the 21st the flank attack opened; Ney and Lauriston moving direct upon Gleina, while Reynier and Victor operated by a wide turning movement against Barclay's right rear. The advance was carried out with precision; the Russians were quickly dislodged and Ney was now closing upon the rear of Blücher's corps at the village of Preitz. Napoleon at once ordered Soult's four corps to renew their attacks in order to prevent the allies from reinforcing their right. But at the critical moment Ney punctiliously halted; he had received orders to be in Preitz by 11 A.M. and he reached that place an hour earlier. The respite of an hour enabled the allies to organize a fierce counter-attack; Ney was checked until the flanking columns of Victor and Reynier could come upon the scene. At 1 P.M., when Ney resumed his advance, it was too late to cut off the retreat of the allies. Napoleon now made his final stroke. The Imperial Guard and all other troops in the centre, 80,000 strong and covered by a great mass of artillery, moved forward to the attack; and shortly the allied centre, depleted of its reserves, which had been sent to oppose Ney, was broken through and driven off the field. Blücher, now almost surrounded, called back the troops opposing Ney to make head against Soult, and Ney's four corps then carried all before them. Preparations had been made by the allies, ever since Ney's appearance, to break off the engagement, and now the tsar ordered a general retreat eastwards, himself with the utmost skill and bravery directing the rearguard. Thus the allies drew off unharmed, leaving no trophies in the hands of Napoleon, whose success, tactically unquestionable, was, owing to the want of cavalry, and, above all, to Ney's want of intelligent initiative, a *coup manqué* strategically. The troops engaged were, on the French side 163,000 men, on that of the allies about 100,000; and the losses respectively about 20,000 and 13,500 killed and wounded.

BAUXITE. P. Berthier (1821) discovered that a non-plastic, clay-like substance from Les Baux, near Arles (France) was practically devoid of silica, either free or in combination. His analysis of it indicated 52.0% alumina, 27.6% ferric oxide, and 20.4% combined water. Berthier referred to it as "le mineral des Beaux." A. Dufrenoy (1847) coined the word *Beauxite* "nom donné à l'alumine hydratée de Beaux." H. St. Clair Deville (1861), the father of the aluminium industry, corrected the spelling to *Bauxite* to correspond with that of the type locality Les Baux. Since then material of similar composition to that of Les Baux has been called Bauxite in Europe and America.

F. R. Mallet (1881) compared the iron clays of Ulster (Irish bauxite) with Indian laterite, suggesting a similar origin for both. Max Bauer (1899) produced chemical evidence showing that some Seychelles laterite was identical with bauxite in composition. H. and F. J. Warth (1903) conclusively proved that, chemically, the aluminous laterite of India was bauxite. L. L. Fermor (1916) considered that bauxite is not a mineral and should be regarded as a variety of the rock laterite. F. W. Clarke (1920) expressed the opinion that bauxite shades into laterite and there is no dividing line between them. C. S. Fox (1923) stated that the word bauxite implies chemical purity, and that it refers to aluminium ore composed almost entirely of the hydrated oxides of aluminium and ferric iron with the former element present in a commercially extractable amount, whereas the word laterite carries a genetic significance. As all bauxites are not of lateritic origin, a distinction should be recognized in bauxites of various origin. The terms Laterite Type and Terra Rossa Type have been provisionally suggested (1927). The relationship between

the *terra rossa* of the Mediterranean seaboard and the bauxites of southern Europe awaits proof. There are some bauxites which evidently do not fit into either of the above types.

The mode of occurrence of bauxite varies with the type to which it belongs; with the primary or detrital character of the deposit; and with the tectonic disturbances to which it has been subjected. In India bauxite is intimately, although irregularly, associated with the primary laterite which caps many of the basaltic plateaux of the peninsula. No Indian plateau of this nature exceeds an elevation of 5,000ft. In Nyassaland bauxite has been located on the Lichenya plateau at an elevation of 6,000ft., where it overlies decomposed syenite. Bauxite on the Gold Coast is found in genetic association with horizontal beds of shale on Mt. Ejuanema, and with steeply inclined phyllites and mica-schists with auriferous quartz reefs on Mt. Supirri. In British Guiana bauxite occurs as the residual weathering product of dolerite and epidiorite. This association is also true of the bauxite in Surinam and French Guiana. In Arkansas (U.S.A.) bauxite overlies kaolinized nepheline-syenite. An inter-trappean bed of bauxite occurs among Tertiary basaltic lavas both in Ireland (Ulster) and Germany (Hesse Nassau). The bauxites of Australia appear to be similar to those of India.
